PERSONAL NARRATIVE

OF

EXPLORATIONS AND INCIDENTS

IN

TEXAS, NEW MEXICO, CALIFORNIA, SONORA,
AND CHIHUAHUA,

CONNECTED WITH

THE UNITED STATES AND MEXICAN BOUNDARY COMMISSION

DURING THE YEARS 1850, '51, '52, AND '53.

BY

JOHN RUSSELL BARTLETT,

UNITED STATES COMMISSIONER DURING THAT PERIOD.

WITH MAP AND ILLUSTRATIONS,

TWO VOLUMES COMPLETE IN ONE.

NEW YORK :

ENTERED, according to Act of Congress, in the year 1854, by

D. APPLETON & COMPANY,

In the Clerk's Office of the District Court of the United States for the Southern District of
New York.

PREFACE.

IN submitting to the public an account of my explorations during the several years that I filled the place of Commissioner on the part of the United States, for the Survey of the Boundary between the United States and Mexico, I have endeavored as far as possible to confine myself strictly to what is embraced in the title, viz., a Personal Narrative of Explorations and Incidents.

Having this idea constantly before me, I have admitted only such digressions as seemed absolutely necessary for a full understanding of the subject. Short descriptions of the towns visited have been given, as well as general remarks on the country from time to time. So of the botany and zoology, I have endeavored to keep before the reader a correct idea of the character of the country throughout which he

917.8
B28

was to follow me, without lists and descriptions, scientific or otherwise, of every plant, quadruped, bird, and reptile that came in my way.

As an itinerary giving an accurate description of the country from the shores of the Atlantic to the Pacific—of every day's journey—of every stream, lake, pond, or spring—of all the mountain chains and their defiles—of every plain and desert—of the towns, villages, houses, ranchos, and farms where the traveller may obtain supplies—of spots where he may find grass for his animals, and where he can find none—of districts destitute of wood and water—I have endeavored to make it particular and accurate, in order that my book may become a useful guide to emigrants and other travellers. A vast deal of suffering may be saved by placing in the hands of emigrating parties a guide across the country to the golden regions of California, whither so many are now annually wending. The time is not far distant, either, when crowds as large as those now pressing on to California and Australia will be "prospecting" among the mountains of Texas, New Mexico, Chihuahua, and Sonora, attracted by similarly rich mineral deposits, and probably with the like splendid success. This will not be the result of an accidental discovery, as was the gold in the mill-race near the Sacramento; for the existence of such treasures is already known, as well as the localities where they are to be found. My journeys through

Sonora, Chihuahua, and other Mexican States, are given with much detail on the topics mentioned; which I fear will render this itinerary dry to many, although to others it will give the book its chief value.

I have divided my narrative into distinct journeys, each complete in itself. The first is from Indianola, on the coast of Texas, where the Commission disembarked, via San Antonio and the northern route (not now travelled), to El Paso del Norte, about 850 miles. A second to the Copper Mines of New Mexico, in the Rocky Mountains near the Rio Gila, with a residence there of several months. A third to the interior of Sonora, and back. A fourth from the Copper Mines along the boundary line south of the Gila to the Rio San Pedro, and thence through another portion of Sonora to Guaymas on the Gulf of California. Fifth, a voyage from Guaymas to Mazatlan and Acapulco, and thence to San Diego, and San Francisco. Sixth, various journeys in California. Seventh, a journey from San Diego, by the Colorado and Gila rivers, to El Paso del Norte. And lastly, a journey through the States of Chihuahua, Durango, Zacatecas, New Leon, Tamaulipas, and the south-western corner of Texas, to Corpus Christi on the Gulf of Mexico. These several journeys embrace an extent of nearly 5,000 miles by land.

With reference to the aboriginal tribes, I have described with minuteness only those with which I

remained some time, and whose habits I had a good opportunity to study. I have also incidentally spoken of the tribes through whose countries I passed, without entering into any detail. This subject is so extensive, and requires so much study, that it can be done justice to only by being treated as a whole. I was so fortunate as to obtain vocabularies of more than twenty aboriginal languages, many of which had never been taken down before, and none so fully, as by me. These valuable testimonials of the now fast disappearing red race who preceded us in the possession of our country, I consider among the most important of my collections, and as such, I believe they will be esteemed by the learned. They each embrace two hundred words, and, with but two or three exceptions, were all taken down by myself, with great care, and according to one system.

My further ethnological collections embrace portraits of many of these tribes, both male and female, showing the characteristic features of each. Sketches were also taken which exhibit their manners and customs, their arts, husbandry, etc. It is my desire to prepare a report on the ethnology of the Indian tribes of the extensive region explored by the Boundary Commission, should the government feel sufficient interest in the subject to authorize it. Without the aid of government, I shall be compelled to limit myself to a brief memoir, embracing merely my philological collections.

From the time of the Commission's landing at Indianola, during the whole period of its continuance, every opportunity that offered, without interfering with the direct object had in charge, was improved for the purpose of making explorations, and forming collections in various departments of natural science.

In the department of Botany four gentlemen were employed in making collections. Dr. J. M. Bigelow, Surgeon of the Commission, and Mr. George Thurber, who was most of the time connected with the Quartermaster and Commissary Departments, in addition to their other duties, examined the botany of the region respectively passed over by them, and made very large collections of plants—the latter over a country extending from the Gulf of Mexico across the continent to the Pacific Ocean. Mr. Thurber, who accompanied me in most of my journeys, was indefatigable in his exertions to make thorough examinations and complete collections of every thing belonging to his department, notwithstanding the numerous obstacles he had to encounter. He, in addition, formed an extensive herbarium, embracing plants, etc., collected in the various States of the republic of Mexico visited by us. Two other botanists, Dr. C. C. Parry and Mr. Charles Wright, have also made large collections. The former was connected with the surveying parties under the immediate direction of Major Emory, and did not accompany me, so that I am unable to speak from per-

sonal knowledge of his labors; but from his well known reputation, as well as that of Mr. Wright, I doubt not they have accomplished much. It is to be hoped that the government will place a proper estimate on the labors of these several gentlemen; and I feel confidence in saying that when they are made known, they will reflect great credit upon them, and furnish important accessions to science.

In Zoology our collections are large, and embrace many new species. The collectors in this department were Mr. J. H. Clark, Mr. Arthur Schott, and Dr. Thomas H. Webb. As these collections are unfortunately scattered, one portion being in the Smithsonian Institution and another in Boston, I am unable to speak with precision of their extent. Of the first collection sent home by Mr. Clark in the spring of 1852, the naturalists connected with the Smithsonian Institution, Professors Baird and Girard, remark that, "It will be perfectly safe to say that one hundred undescribed species of North American vertebrate animals have been added to our fauna. The entire annals of zoological history scarcely present a parallel to this case." Since that time other collections have been received by the same institution. It is to be hoped that this large and valuable accession to the zoology of the North American continent may be properly appreciated by our government, and that the distinguished naturalists now engaged in describing the

specimens, may be authorized to present them to the scientific world in such a style and form as their value and interest merit.

From the peculiar geological features of the country passed over, a valuable report on that subject might be expected; but I regret that, as Congress denied me an appropriation for the purpose, I was unable to secure the services of any geologist competent to make such investigations as were desirable. Several gentlemen who filled responsible places, particularly Dr. Webb, Secretary of the Joint Commission, contributed their services in collecting such mineralogical specimens as circumstances would allow. It was highly desirable to institute a continuous series of geological and mineralogical researches, and to form a cabinet illustrative of the structure and mineral resources of the region along the whole course of the survey; but both the scientific corps, and the number of soldiers at my disposal for the purpose of escort, were too small to admit of this being done. Notwithstanding, however, every drawback, a large collection of minerals was made by Dr. Webb, including silver ores from New Mexico and Chihuahua, and other ores from various places along the line, which have reached home in safety. Among these mineralogical treasures is a fine specimen of bituminous coal. In connection with this subject I may add, that we visited and explored many of the mines in New Mexico, Sonora, Chihuahua,

and California, of gold, silver, copper, and quicksilver, and obtained specimens of the ores; besides which much valuable information was collected in reference to the extent, value, and productions of these mines.

I should do injustice to our accomplished artist and draughtsman, Mr. Henry C. Pratt, who accompanied me in my journeys to and from California, did I not speak of his valuable services. Besides the portraits of the Indian tribes and illustrations of their manners and customs, Mr. Pratt has made a series of many hundred sketches, representing the peculiar character of the country extending from ocean to ocean along the boundary line, and in the States contiguous. Many of these sketches are panoramic views embracing wide districts of country, and convey to the mind a better idea of it than the most elaborate description. I have, therefore, very reluctantly been compelled to omit the most important of them from the present work, as it would detract too much from their merits to reduce them to the size of an octavo page.

There is another topic, one too, which possesses a deeper interest for the American people and the whole civilized world, than those to which I have alluded. This is the adaptation of the country explored by the Boundary Commission *for the purposes of a railway*. The descriptions of the country given in our daily marches will convey some idea of the advantages presented; but without the large sketches mentioned,

barometrical profiles, and elaborate maps, I could not do justice to the subject. In the extensive journeys of the Commission through Texas to the shores of the Pacific, by the route south of the river Gila, I was enabled, with the assistance of the engineers intrusted with the survey of this portion of the line, to collect much valuable information on the topography of the country, for the purpose of enabling the public to judge whether or not it is practicable to construct a railway there. It is to be hoped that Congress will see fit to lay this information, obtained with so much toil and expense, in a suitable manner before the people.

The maps of the survey, as well as the astronomical, magnetic, and meteorological observations, with all that strictly appertains to the running and marking of the boundary line, were, by the instructions of the Secretary of the Interior, placed in charge of the surveyor, Brevet Major W. H. Emory, who alone is held responsible for the faithful performance of these duties. From the high character of that officer as an engineer, the public may expect, in proper season, a satisfactory account of his labors in these departments. Some time must elapse before the maps to illustrate the whole Boundary, from one ocean to the other, can be completed; I have therefore been compelled to construct meanwhile the map prefixed to this work from my own itinerary and from the most authentic information that could be obtained.

The question has been repeatedly asked, and may be asked again, why the account of the doings of the Commission embraced in this narrative was not published by the government, alike with other reports of explorations made by its officers. In reply I have to state that, on my return home, after being superseded as Commissioner, I was desirous to submit my report to the Secretary of the Interior, for publication under his direction. To effect this a resolution was offered in the Senate by one of its distinguished members, General Houston of Texas, who takes a lively interest in the promotion of science, and particularly in the investigation of the unexplored regions of our country, to authorize me to prepare and publish a full Report of the labors of the Commission while under my charge, including the Natural History, in which so much had been accomplished. The efforts of the learned Senator however were unsuccessful, and the resolution was laid on the table. This decision, a source of lively regret to me, I trust is not to be regarded as final; and I cherish the hope that Congress will yet decide to place the whole results of the Commission before the public in a suitable manner.

CONTENTS OF FIRST VOLUME.

FIRST DIVISION.

NEW-YORK TO EL PASO, THROUGH TEXAS.

CHAPTER I.

NEW-YORK TO INDIANOLA.

	PAGE
Treaty of Peace between the United States and Mexico—Hon. J. B. Weller appointed Commissioner to run the new Boundary Line between the two Republics—Determines the initial point on the Pacific and the centre of the mouth of the Gila—Col. J. C. Fremont's Appointment and Resignation—J. R. Bartlett appointed Commissioner—Fitting out and Organization of the Expedition—Embarcation of main body of Commission from New-York—Embarcation of Commissioner and others—Water-Spouts—Havana—New Orleans—Arrival at Indianola. . . .	1

CHAPTER II.

INDIANOLA TO SAN ANTONIO.

Preparations for the Start—Breaking mules—La Salle and its early History—Prosperity of Indianola—Commencement of Survey—Route to Victoria—Shoeing mules—Encampment in grove—Military drilling—Flourishing condition of Victoria—Primitive legal proceedings—Difficulties of navigating Espiritu Santo Bay—Description of surrounding country—Mexican rancho—Observance of the Sabbath—Justice dispensed in the matter of a calf—Goliad, its early history and ruins—Massacre of prisoners after the battle of Perdida Creek—Leave Goliad—Murder of a Mexican by a teamster—Arrival at San Antonio—Another murder—Preparations for crossing the Plains—Description of San Antonio—Alamo—Mission Churches.	10
--	----

CHAPTER III.

SAN ANTONIO TO FREDERICKSBURG.

Advanced party formed for the journey to El Paso—Arms and equipments—Mode of travel—General order—Storm on the Prairie—Guadalupe river—Refinement among the German settlers on its banks—Terraced hills of Texas—Mormons in the valley of the Piedernales—Fredericksburg.	PAGE 46
---	------------

CHAPTER IV.

FREDERICKSBURG TO HORSE-HEAD CROSSING.

Projected route through the wilderness—Setting out—Uninviting appearance of the country—Precarious condition of German settlements on the Llano River—Leave the Emigrants' Road—Crossing of the San Saba—Community of prairie dogs—Kickapoo Creek—Hints to future travellers—The Mezquit—Visit of Lipan Chiefs—Indian dexterity in mule catching—Regain the Emigrant Road at Concho River—Horse wounded by a rattlesnake—Character of country and vegetation—Mustang roads—Scarcity of water—Prairie on fire—Deceptive maps—Castle Mountains—Stray cattle captured—Pecos River—Chapporal—"Indian sign."	61
---	----

CHAPTER V.

HORSE-HEAD CROSSING TO DELAWARE CREEK.

Crossing of the Pecos—Narrow escape from a cold bath—Desolate region—Prize oxen—Stray mule—Populous biscuit—Toyah Creek—Travellers' tokens—Rescue of lost mule—Dreariness and monotony of the Pecos—A horse's somerset—Delaware Creek—Snow-storm, sport, and Erman's Siberia—Mr. Thurber and others dispatched to El Paso—Letter to Major Van Horne.	96
--	----

CHAPTER VI.

DELAWARE CREEK TO EL PASO.

Difficulty of proceeding—Set out with a small party in advance—View of Guadalupe Mountain—Boiling Spring—Deceptive clearness of the atmosphere—Guadalupe Pass—Descent to the plain—Meet Mr. Coon's train—Hospitality—Mr. Thurber's note—Take leave of the train—Cornudos del Alamo—Thorne's Well—Ojos del Alamo—Waco Mountain Pass—Waco Tanks—Meet Messrs. Thurber and Weems on their return—Arrival at El Paso—Itinerary of route—Remarks on the country traversed—Its adaptability to a public road.	115
--	-----

SECOND DIVISION.

EL PASO TO THE COPPER MINES.

CHAPTER VII.

EVENTS AT EL PASO.

	PAGE
Losses of Animals—High price of provisions at El Paso—Excursion up the river—Entertainment given to the officers of the Commission by the civil authorities—The Bishop of Durango—Pueblo Indians—Meeting with General Condé, and commencement of the labors of the Joint Commission—Arrival and disposition of the main body of the United States Commission—Arrival of ox-train, and death of U. D. Wakeman—Departure of military escort for the Copper Mines—American desperadoes in New Mexico—Death of E. C. Clarke—Trial and execution of Wade, Craig, and Butler—Trial and execution of Young—Dinner and ball given under difficulties—Excursion to the Sierra Waco—Indian pictures at the Waco Tanks—Initial Point agreed upon, and Survey in its vicinity commenced—Depot established at the Copper Mines—Dr. Webb's report on the same.	143

CHAPTER VIII.

EL PASO AND VALLEY OF THE RIO GRANDE.

Early colonization of Mexico—Position of El Paso—Mode of irrigation—Agricultural productions—Vegetables—Fruits—Extensive culture of the grape—Wine—Brandy—The Rio Grande—Deficiency of water—Uncertainty of crops—Houses—How built—Oriental style preserved—Primitive mode of life—Flour mills—Degeneracy of people—Dress—Settlement on the American side—Coon's Ranch—Magoffinsville—Socorro—San Eleazario—Mountain chains—Plants—Current and sinuosity of the Rio Grande.	182
---	-----

CHAPTER IX.

EL PASO TO THE COPPER MINES.

Observations on the Rio Grande, from El Paso to Doña Ana—Establishment of the Initial Point, and ceremonies connected therewith—Description of Doña Ana—Mesilla—Route to Santa Barbara—Visit to ruins—	
--	--

	PAGE
Mirage—Route to the River Mimbres—Luxuriant vegetation on its banks—"Giant of the Mimbres"—Ojo Caliente—A broken arm—Arrival at the Copper Mines—Description and history of the Mines—Value of the timber in the vicinity—Abundance of game—Scarcity of vegetables—Visit to Sonora projected.	197

THIRD DIVISION.

JOURNEYS AND INCIDENTS IN SONORA.

CHAPTER X.

THE COPPER MINES TO AGUA PRIETA.

Spring at Pachetehu—Ojo de Vaca—Janos road—Col. Cooke's road—Scarcity of water—Dry bed of a lake—Mirage—Desert region—Zoology of the plains—Guadalupe Pass—Difficulties—Bears—Discover footprints of deserters from Copper Mines—Sycamore trees—Cañon—Luxuriant vegetation—Descend from the great plateau—Change of climate—Ruined hacienda of San Bernardino—Wild cattle—Black Water Creek—Teamster attacked by a bull—Grave of an American deserter. 241

CHAPTER XI.

AGUA PRIETA TO ARISPE.

Leave the California road—Agua Prieta—Send party to look for Fronteras—Mexican soldiers sent to guide us in—Journey resumed—Strike a rich valley—Break a wagon—Reach Fronteras—Description of the place—Abandoned by its people and recolonized—General Carrasco—Couriers between the frontier posts—Attack by General Carrasco on Apaches at Janos—Campaign against the Apaches—General Carrasco's opinion of American officers—The Doctor beset by the sick—Leave Fronteras—Coquiarachi—Valley of Barbari—Wild turkeys—Mountain Pass—Gold Mine—Bacuachi—Sonora River—Magnificent cañon—Chinapi—Curious sandstone formation—Arrival at Arispe. 261

CHAPTER XII.

FROM ARISPE BACK TO THE COPPER MINES.

	PAGE
Description of Arispe—Primitive church service—Scarcity of grain and fruit, and abundance of vegetables—Set out on our return—Broken down wagon abandoned—Reach Fronteras—A blacksmith's independence—Celebration of a Saint's day—Manufacture of aguardiente—Various uses of the Maguay—Doctor's fees—Broken wagon metamorphosed into a cart—Sorry plight of a wild bull—Strike Cooke's road—Traces of fire in the Guadalupe Pass—Mexican encampment—Story of Americans attacked by Apaches—Reach the Copper Mines—Colonel Graham not arrived—Visit General Condé's camp, and consult with Lieutenant Whipple—Return to the Copper Mines.	282

CHAPTER XIII.

INCIDENTS AT THE COPPER MINES.

Visit from the Apaches—Mangus Colorado—Arrival of Mr. Sanford—11th Article of the Treaty relating to captives—Arrest of New Mexican traders—Inez Gonzales, the Mexican captive—Examination of traders—Story of the captive girl—Pinalenos Indians—General Condé arrives—The 11th Article of the Treaty enforced—Friendly intercourse with the Indians—Two Mexican boys taken from them—Excitement in consequence—Conference and dialogue with the Apache chiefs—Amicable settlement of difficulties.	300
--	-----

CHAPTER XIV.

INCIDENTS AT THE COPPER MINES.

Intercourse with the Apaches—Mangus Colorado and his new clothes—Proper mode of treating Indians—Treachery and massacre of Indians by an Englishman—Tribe of Copper Mine Apaches—Their numbers—Extent of their incursions—Ethnological position—Inferiority of the tribe—Dress—Visit from the Navajos—Their fine blankets—An Apache shot by a Mexican—Alarm—Arrest and examination of prisoner—Death of the Indian—The murderer demanded by the Apaches—Conference with the Chiefs, and their talk—Restoration of friendship.	319
---	-----

CHAPTER XV.

INCIDENTS AT THE COPPER MINES.

Arrival of Mr. A. B. Gray—Meeting of Joint Commission—Objections of Mr. Gray to Initial Point—Mules missing—Arrival of Colonel Graham	
---	--

	PAGE
—Mules stolen from Frontera—Descent of the Apaches on the mule herd—Organization of parties for the Survey—Application to Colonel Sumner for more troops—Hostile attitude of the Indians—Second incursion of the Indians—Mules taken—Colonel Craig goes in pursuit—Arrival of Captain Buford with dragoons to our aid—Indians pursued by Colonel Craig and Captain Buford—Third incursion of the Indians—Volunteer party go in pursuit—Indians overtaken and cattle recovered—Apache chief recognised among the robbers—Determine to set out for the Gila.	340

CHAPTER XVI.

THE COPPER MINES TO RIO SAN PEDRO.

Organization of parties for the survey of the Gila—Leave the Copper Mines—Pack-mules—Mode of packing—Ojo de Vaca—Camp in the Burro Mountains—Ojo de Inez—Grizzly bear—Violent rain—Heavy travelling—La Piloncillo, or Sugar-loaf Mountain—Broad plain—Camp at El Sauce—Man missing—Camp in the Chiricahui Mountains—Boggy road—Want of water—Dry lake—Reach the Mexican camp—Meeting of the Joint Commission—Mr. Gray's objection to the boundary—March resumed—Mules abandoned—Reach San Pedro River—Its character.	355
--	-----

CHAPTER XVII.

RIO SAN PEDRO TO SANTA CRUZ.

The valley of the San Pedro—Decide on going to Santa Cruz for provisions and mules—Departure of General Condé—Leave the San Pedro—Take the trail of the Mexicans—Deserted Indian village—Leave the trail—Wild horses—Santa Rita Mountain—Beautiful valley—Progress arrested—Critical situation—Mr. Thurber goes in search of Santa Cruz—Arrival of Colonel Graham—Ruined hacienda of Calabasa—Wild scenery—On short allowance—Return of Mr. Thurber—Retrace our steps towards the San Pedro—Mustangs—Camp on the Babocomori—Arrival of Mexican soldiers—General Condé loses his way—Sufferings of his party—Mexicans hunting cattle on the San Pedro—The father and friends of Inez Gonzales arrive—Set out again for Santa Cruz—Meeting of the captive girl and her mother—Arrival at Santa Cruz.	379
--	-----

CHAPTER XVIII.

SANTA CRUZ TO LA MAGDALENA.

Account of the missing parties—Description of Santa Cruz, and its population—Departure of Colonel Graham—Set out for La Magdalena—In-	
---	--

	PAGE
crease of party—San Lazaro—Cocospera—Its beautiful valley—The cañon where Inez Gonzales was taken—First sight of the Cereus Giganteus—Babasaqui—Wild cattle—Imuris—Terrenati—San Ignacio and its church—Abundance of pomegranates—Passports demanded—Proceed to Magdalena—Summoned before the Alcalde—Legend of the origin of the town—Festival of San Francisco—Religious devotees—Offerings to the Saint—Consecration of ribbons—Booths—Gambling—Perpetual fandango—Vegetable productions near the town—Fine scenery—Grand torchlight procession—Close of the festivities—Description of La Magdalena.	406

CHAPTER XIX.

ILLNESS AND DETENTION AT URES.

Leave La Magdalena—Taken ill—Diary breaks off—Sufferings on the road—Reach Ures—Poor quarters—Dr. Webb and rest of party visit Guaymas—Kindness of Dr. Campbell—Description of Ures, the capital of Sonora—Theatricals—The Yaqui Indians—The Opaté Indians—Visit from Tanori, an Opaté chief—Other Indian tribes of Sonora—Exports—Narrative of an expedition against the Apaches—My party leave me and go to the Gila—Taken to Dr. Campbell's—Irruption of the Apaches—Imbecility of the Mexicans—Tanori and the Opaté Indians go in pursuit—Visit from the Coco-Maricopa Indians of the Gila—Good news from Tanori—He defeats the Apaches and recovers the stock—Entrance of the victors with the recovered booty into Ures—Death of General Garcia Condé—His character—An American held in bondage—Arrival of General Flores—Departure for the coast.	433
--	-----

CHAPTER XX.

URES TO GUAYMAS.

Leave Ures—Rich valley—Tapahui—Don Manuel Gandera—His large estates—Successful farming—Statistics of his haciendas—Silver mine—Reach Hermosillo—Governor Aguilar—The Ceris Indians—Obtain their language—Account of the tribe—Mode of poisoning their weapons—Description of Hermosillo—The Sonora River—Productions of the valley—Business relations—Sketch of the town—Departure—Meet French emigrants—Description of the country—Its barrenness—Business-like mode of milking cows—La Cieneguita—Buena Noche—Reach Guaymas—Mr. Robinson, the U. S. Consul—Description of Guaymas and its Campo Santo—Its harbor—Commerce—Intense heat—Departure.	458
---	-----

CHAPTER XXI.

GUAYMAS TO SAN DIEGO, CALIFORNIA.

PAGE

Voyage down the Gulf of California in a pilot boat—Barren coast—Island of Carmen—Loreto—Reach Mazatlan—Its picturesque appearance—Description of the town—Americans here—Embark for Acapulco—Land at San Blas—Visit to Mr. Horn, the Captain of the Port—Ride to the old town—Its beautiful position—Ruined condition—Visit an old fortress—Leave San Blas—Description of the coast—Volcanoes of Colima—Land at Manzanillo Bay—Its unhealthy climate—Laguna—Cargo discharged—Stupidity of Custom House official—Leave without papers—Reach Acapulco—Chinese hotel—Beautiful harbor—Castle of San Carlos—Unhealthiness of the place—Extreme heat—Noxious insects—Description of the town—Ancient commerce—Departure for San Diego—Crowded state of the steamer—Voyage up the coast—Arrival at San Diego—Rejoin the Boundary Commission.	482

FIRST DIVISION.

NEW YORK TO EL PASO, THROUGH TEXAS.

CHAPTER I.

NEW YORK TO INDIANOLA.

Treaty of Peace between the United States and Mexico—Hon. J. B. Weller appointed Commissioner to run the new Boundary Line between the two Republics—Determines the initial point on the Pacific and the centre of the mouth of the Gila—Col. J. C. Fremont's Appointment and Resignation—J. R. Bartlett appointed Commissioner—Fitting out and Organization of the Expedition—Embarcation of main body of Commission from New York—Embarcation of Commissioner and others—Water-Spouts—Havana—New Orleans—Arrival at Indianola.

THE treaty of peace between the United States and the Mexican Republic, dated at Guadalupe Hidalgo, on the 2d February, 1848, requires that "the two governments shall each appoint a commissioner and surveyor, who, before the expiration of one year from the date of the exchange of ratifications of this treaty, shall meet at the port of San Diego," and proceed to run and mark the boundary between the two countries "in its whole length to the mouth of the Rio Bravo del Norte." These officers are required to "keep journals and make out plans of their operations; and the result agreed upon by them shall be deemed a part

of this treaty, and shall have the same force as if it were inserted therein. The two governments will amicably agree regarding what may be necessary to these persons, and also as to their respective escorts, should such be necessary."

The treaty requires that the starting or initial point on the Pacific Ocean shall be "one marine league due south of the southernmost point of the port of San Diego, according to the plan of said port, made in the year 1782 by Don Juan Pantoja, second sailing-master of the Spanish fleet, and published at Madrid in the year 1802, in the Atlas to the Voyage of the schooners Sutil and Mexicana." From this point the line separating Upper from Lower California was to be "a straight line to the middle of the Rio Gila, where it unites with the Colorado."

The Hon. John B. Weller was appointed the first Commissioner, and Andrew B. Gray, Esq., the first Surveyor under the treaty. They took with them to San Diego a corps of engineers and assistants. Major W. H. Emory, Captain E. L. F. Hardcastle, and Lieutenant A. W. Whipple, of the U. S. Topographical Engineers, the first as chief, and the latter as assistant astronomers, were detailed by the government to aid the commissioner and surveyor, in carrying out the stipulations of the treaty. They assembled at San Diego in the month of June, and entered upon their duties soon after.

Without going into any detail of the proceedings of this Commission, it will be sufficient for my purpose to say, that the two important points referred to, viz., the initial point, one marine league south of the Bay

of San Diego, and the middle of the Rio Gila, where it unites with the Colorado, were determined by means of an elaborate series of astronomical observations, by the Topographical Engineers intrusted with these duties. A considerable portion of the straight line connecting these points was also run.

In February, 1850, it was found impracticable to advance eastward beyond the mouth of the Gila, and towards the frontier of New Mexico, in consequence of the difficulties attending the fitting out of large parties for the important service to be performed. The Commission then adjourned, to meet at El Paso, in the State of Chihuahua, on the first Monday of November following.

Soon after the adjournment, Mr. Weller was removed, and Colonel J. C. Fremont appointed to his place; but before the latter gentleman entered upon his duties as Commissioner, he was elected by the people of California, to represent that State in the Senate of the United States. Elected to so distinguished an office, Colonel Fremont did not hesitate to resign his place as Commissioner on the Boundary, when I was honored by President Taylor with the appointment to succeed him.

I received my letter of appointment in June, 1850, when I immediately set to work, to organize such a party as would be necessary to carry on the survey, and to procure the outfit required for the service. Here was a preparatory labor of several months. But, as I was required to be at El Paso del Norte, on the Rio Grande, on the 1st Monday in November, the day on which the joint Commission was to meet, agreeably

to the adjournment in the preceding February, there was little time left me for these preparations; for, making every exertion, I could not expect to reach that far-distant place, in less than two months after leaving the Gulf of Mexico. This would leave me little more than two months, viz., July and August, to select my assistants, organize the Commission, procure the necessary outfit, and transport the whole to the most convenient point on the Gulf of Mexico, from which the party could start on its long march for the interior.

I immediately set to work to complete the arrangements previously made for wagons, tents, camp equipage, arms and ammunition, instruments, stationery, etc., and to purchase provisions, medical stores, and such other articles as would be required in a distant country, where few of the necessaries of life could be procured, and still less of the supplies required by surveying parties, except only animals, and the means of transportation.

Twenty-five wagons were contracted for, in Newark, New Jersey, including ambulances, or spring wagons, for the transportation of surveying and astronomical instruments, and other purposes. Four iron boats, with their equipments, were constructed, under the direction of Lieutenant J. G. Strain, U. S. Navy. Tents for the whole party, camp equipage, harness, saddles and bridles, pack saddles, mechanics' tools, fire arms, and the other articles named, were purchased in New York; in which duty I had the assistance of the same officer, who was indefatigable in his exertions to prepare the party for service.

That no time might be lost in the preparations for

the field, I first appointed a Quarter-master and a Commissary, who immediately entered upon their respective duties. The former, James Myer, Esq., a gentleman from Texas, who had been connected with the Quarter-master's department, under General Taylor, in the late war with Mexico, proceeded at once to Texas, with his assistant, Edward Clarke, Esq., for the purpose of procuring horses and mules, which were to be brought together at our place of landing. I next appointed the various engineers, surveyors, and their assistants, mechanics, laborers, cooks, servants, etc.; and issued an order to all, to report themselves in the City of New York, on board the Steamer Galveston, on the 3d day of August, 1850, having chartered that vessel to transport the Commission and its stores to Indianola, in Texas.

In organizing the Boundary Commission, I had in view other objects, not directly connected with the survey. By the sixth article of the treaty of Guadalupe Hidalgo, provision is made for the collection of information relative to the construction of a "road, canal, or railway, which shall, in whole or in part, run upon the river Gila, or upon its right or left bank, within the space of a marine league from either margin of the river."

To make these examinations required an additional force; but besides this, my intention was to commence the survey with two parties simultaneously, at El Paso, and work towards both the Pacific and the Atlantic, by which means the work would be brought to a much speedier termination, than if a single party of engineers should take the field and carry on the work,

from one end of the line to the other. To do all this required four full parties, two of them being astronomical and two surveying. The Commission was therefore organized accordingly. Its chief officers, when the re-organization took place, after my appointment, were as follows:

JOHN R. BARTLETT,	<i>Commissioner.</i>
ANDREW B. GRAY,	<i>Surveyor.</i>
COL. JOHN McCLELLAN,	<i>Chief Astronomer.</i>
LIEUT. J. G. STRAIN,	<i>U. S. Navy.</i>
LIEUT. A. W. WHIPPLE,	<i>Assistant Astronomer.</i>
CAPT. E. L. F. HARDCASTLE,	<i>do. do.</i>

The latter officer remained in California, to finish the demarcation of the line between the mouth of the Rio Gila and the Pacific, and did not join the parties which accompanied me. For the programme of the Commission, as organized in Washington, in July, 1850, see Appendix C.

On the third of August following, or about six weeks after my appointment, the outfit, subsistence, etc., were so far ready, that the whole Commission, excepting Lieutenant Whipple, Colonel Chandler, one of the first assistant engineers, two of the assistants, and myself, embarked on board the steamer Galveston, at New York, and set sail the same afternoon for New Orleans and Indianola, Texas. The whole party, embracing officers and men, which embarked, numbered one hundred and five persons, taking with them provisions for six months. An escort of United States soldiers, under Colonel Craig, consisting of 3d Infant-

ry, and embracing eighty-five men, accompanied the Commission.

On the 13th of August, having closed up all the business of the Commission, and procured some astronomical instruments which could not be got ready sooner, I embarked on board the steamship Georgia, Captain Porter, accompanied by the gentlemen before referred to, for Havana, where we arrived on the morning of the 19th, after a pleasant voyage. With the exception of a thunderstorm off Cape Hatteras, and the unusual sight of five water-spouts at the same time, from a large heavy cloud about two miles to the leeward, there were no incidents worth recording. The water-spouts were interesting on account of the unusual number seen at the same time. One of these, and the largest, rose in a direct perpendicular column from the surface of the ocean to the cloud, funnel-shaped at either end, or like a huge column, its base on the ocean, its capital under the cloud. All the others were spiral, and connected in the middle by an apparently small column of water. They soon disappeared, as well as the heavy cloud with which they were connected. The turbulent ocean, which had lashed the ship's sides for a couple of hours, soon became composed, and relapsed into a dead calm. This continued until we rounded the Moro Castle, and entered the beautiful harbor of Havana.

In the afternoon of the same day we left the Georgia, which went no further, and embarked on board the steamer Falcon for New Orleans. A striking contrast was presented in these two ships. The former was sweet and clean in every part; while the filth of

the latter, and the stench arising from her cabin and hold, resembled that from a hog sty. She had just arrived from Chagres with a large number of passengers from California, many of whom were suffering with fever. One poor creature died during the day, and was sent on shore for interment. Although we felt somewhat apprehensive on finding ourselves in Havana at mid-summer, when foreigners generally leave, and when all avoid it who can, I suffered no inconvenience from the heat, which was not more oppressive than in New York; still we took the precaution to keep very quiet. A gentle breeze drew in from the ocean, making it comfortable under the awning. Towards evening, I went on shore with Lieut. Whipple, when we took a *volante* and drove out to the bishop's palace, and the neighboring public places of resort.

Tuesday, August 20th. At two o'clock P. M., sailed for New Orleans; the weather pleasant, and not uncomfortably warm. The boat was not only crowded with passengers, but, to increase the discomfort, her decks were filled with crates of pine-apples and other fruits, so as to leave but little room to move about. When I went to retire, I learned that there were two passengers on board with the yellow fever; in fact, I had arranged my cot near them before I found out what their illness was. Several of the passengers then, myself among the number, thought it more prudent to spread our beds upon the deck, where we had the advantage of a pure atmosphere. Reached New Orleans at midnight on the 23d, and proceeded at once to the Saint Charles Hotel, as did nearly all the rest of the passengers.

I here learned that the Galveston had arrived in safety, and, after a delay of a couple of days, had proceeded to Indianola. One of the officers had been taken with a fever, and remained behind; all the others were in good health.

After remaining at New Orleans two days, we embarked on board the steamer Portland, for Indianola, a clean and comfortable vessel, though somewhat slow. The surface of the gulf was scarcely ruffled by the breeze; so that no one was sea-sick, and all seemed to enjoy the voyage. The fourth day brought us to Galveston, where I found three young men belonging to the Commission, who had been left by the Galveston steamer. Remained here long enough to go to the beach and bathe, which greatly refreshed us; when we continued our voyage, and came to anchor the next evening off the town of La Salle, in Matagorda Bay. Several officers of the Commission, who had been watching the arrival of the steamer, came on board late at night, and informed me that all had arrived in safety, and that they were encamped at Indianola, about six miles distant.

August 31st. A small government steamer came off to us early this morning and took us to Indianola, which we reached at eleven o'clock. Many of the party met me at the landing, when I took an ambulance and rode to the camp, on the shore of the bay, a short distance from the town.

CHAPTER II.

INDIANOLA TO SAN ANTONIO.

Preparations for the Start—Breaking mules—La Salle and its early History—Prosperity of Indianola—Commencement of Survey—Route to Victoria—Shoeing mules—Encampment in grove—Military drilling—Flourishing condition of Victoria—Primitive legal proceedings—Difficulties of navigating Espiritu Santo Bay—Description of surrounding country—Mexican ranch—Observance of the Sabbath—Justice dispensed in the matter of a calf—Goliad, its early history and ruins—Massacre of prisoners after the battle of Perdida Creek—Leave Goliad—Murder of a Mexican by a teamster—Arrival at San Antonio—Another murder—Preparations for crossing the Plains—Description of San Antonio—Alamo—Mission Churches.

SINCE the arrival of the Commission, all parties had been busily occupied in getting ready to move into the interior; and those only who have had experience in fitting out a large train of wagons for a journey across the prairies, or to California, can form an adequate idea of the preparations required. If the route were a settled one, or if settlements were to be met with, even at distances of a hundred miles apart, where supplies could be procured and repairs made, much of the labor necessary on setting out, and a vast deal that is required on the way, might be dispensed with. At this place it was not necessary to complete

our arrangements for a final start. The town did not furnish the facilities for so doing. My intention, therefore, was to proceed to San Antonio, the principal city of Texas, a hundred and forty miles distant, and there complete our outfit for the longer march across the prairies and deserts to El Paso del Norte.

Quarter-master Myer had arrived before the Galveston, with about one hundred horses and mules; but these were quite inadequate for the wants of the party. It was found, too, that the twenty-five wagons brought out were insufficient to transport the property of the Commission; in fact, they would little more than carry the instruments, personal baggage, tents, and camp equipage. The instruments were packed with great care, and filled four of the ambulances. It therefore became necessary to procure at once additional wagons, mules, and horses for the transportation of the provisions, of which we had a six months' supply for one hundred men, as well as for the men to ride on. But that no time should be lost, it was thought best, as fast as the wagons could be got ready, to proceed into the interior, as far as the town of Victoria, where water, wood, and grass were abundant, and where greater facilities were to be found for shoeing our animals than at Indianola. Here there was no wood, and water could be had only from one or two wells, and that of so bad a quality that many of the party had been attacked with complaints of the bowels.

The quartermaster and his men occupied themselves in breaking the mules, very few of which had ever been in harness before. This was done by mak-

ing them draw logs about for a few days, when they became docile, and could be harnessed to the wagons with safety. While this was going on, the mechanics were employed in their various duties. The blacksmiths and carpenters in making many small fixtures to the wagons; amongst other things, all had to be provided with feed-troughs, not a single one of these necessary appendages being furnished with them. All the harness and collars had to be reduced, to adapt them to our Mexican mules, which were much smaller than the mules of Kentucky and Missouri, used at the north, and for the transportation of merchandise for the Santa Fé and New Mexican trade.

La Salle, the place opposite which we came to anchor in entering Matagorda Bay, is so named in memory of one of the most remarkable of the early explorers of the North American continent. This distinguished Frenchman, with the ardent zeal which characterized his countrymen in their attempts to penetrate to the very heart of the continent, had passed the great chain of the northern lakes, pushed his discoveries to the head waters of the Mississippi, and traced its course to the gulf, before the first English colonist had established himself on the Atlantic coast. Coasting along the shores of the gulf in search of a spot whereon he might establish a colony, he landed, against his will, at or near the spot which now bears his name, where he remained nearly a year with a little band of adventurers, facing all the dangers and undergoing all the hardships to which they could be exposed in a country surrounded by hostile Indians. In his attempt to extricate his party, he was murdered by one of them.

This place was selected as the most desirable spot for a town, on account of its depth of water, and convenience of approach from the gulf. Vessels drawing ten feet of water, are said to have passed in without difficulty ; and, to use the words of an enthusiastic admirer of its position, who doubtless had some interest in its success, "it seems to have been intended by nature, to rear and sustain a large commercial city."

From the several examinations which have been made of Matagorda Bay, it appears that the harbors on its western shores, the chief of which are La Salle and Indianola, possess advantages above those of any ports on the Gulf of Mexico, between the mouth of the Mississippi and Vera Cruz, with the exception of Galveston. The whole Texan coast, it is well known, is bordered by long and shallow lagoons, connected with the waters of the gulf by narrow openings, whose position is constantly shifting, and which have not always sufficient depth of water for the passage of large vessels. Paso Cavallo, the entrance to Matagorda Bay, is only second to that which leads to Galveston Bay.

In the contest for superiority, Indianola seems to have carried away the palm ; for while the highly applauded site for the city of La Salle is almost unoccupied, the former has grown into a large and thriving town, second only to Galveston among all the ports of Texas. Indianola is now the port for the extensive commerce with Western Texas, Chihuahua, and portions of New Mexico ; a railroad has already been commenced to connect it with San Antonio, the chief city of the State, and two lines of steamers plying between it and New Orleans will continue to add to its prosperi-

ty. Should one of the contemplated railroads to the Pacific be extended west from San Antonio, with its terminus here, Indianola will rank second only to New Orleans among the cities of the gulf in commerce and population.

The necessity of giving early employment to the large corps of engineers attached to the Commission, in the duties which appertained to their profession, induced me, among other reasons, to make an examination of the country between Indianola and our place of destination on the Rio Grande, in order to ascertain the facilities it afforded for a railroad. With this view I caused a party to be organized to make a chain and compass survey, and to carry a line of levels to determine a profile of the route from this point to El Paso del Norte. The eyes of the South had long been directed this way; for whether there might be a more practicable route or not further north, it was a question of great importance to the southern section of the Union, that all the information possible, should be obtained with reference to the country we were about to traverse, and its practicability for the purpose of a railroad.

The various engineers, surveyors, and assistants, were desirous to enter on active duty as soon as possible, and received with great satisfaction the order to commence their labors in a field comparatively unknown.

Lieutenant A. W. Whipple, of the Topographical Engineers, was placed at the head of the party, and performed the astronomical duties; while Mr. John Bull was the principal surveyor, in charge of this de-

partment of the work. They selected their assistants, and entered upon their operations on the 3d of September.

The preparations on the train, the breaking in of the mules, and obtaining the additional transportation before alluded to, occupied about a week after my arrival. I left Indianola on the fifth of September for Victoria, distant about thirty miles, a portion of the train having preceded me. Immediately on leaving the shores of the bay we entered a fine level prairie, unlimited by hill or any elevation, and covered with the richest grass. Not a tree or shrub interrupted the broad expanse that lay before us. Here and there were gentle undulations, like the long waves of the ocean when, after a severe blow, its agitated waters are subsiding into a calm. The prairie fowl, the great curlew, and flocks of quail arose as we moved along; and being in advance of the party, I had an opportunity to test the qualities of my double-barrelled gun. When but a few miles from the town, we began to observe herds of deer a short distance from the road, grazing in quietness among the innumerable cattle which dotted the plain in every direction, doubtless imagining that proximity to their tame companions added to their security: though, in fact, it proved directly the reverse; for the cunning hunter would take advantage of their presence to approach the nearer to his game. The young men who accompanied me, being prepared with rifles, dashed off to try their hand at this exciting sport, in which they were more or less successful; so that on reaching our place of encampment, they were provided with a fine saddle of venison for their dinner.

The entire distance to Victoria is over the rich prairie just described. It is occasionally intersected by *bayous*, lagoons, or small streams, where the land is brought into cultivation, giving evidence of its inexhaustible richness in the luxuriant growth of cotton and sugar-cane which it bears. Near the water are clumps of trees; and such spots are eagerly sought after as places of residence.

On the morning of the 6th, I reached Victoria, where I found great activity in the camp. Here one of the most important jobs was to be performed, that of shoeing the mules. It was believed, that breaking them in to the harness at Indianola, and two days' journey with heavily loaded wagons, would render them more tractable, when the process of shoeing was to be undertaken. But this rough handling seemed to have subdued them but little. They were as wild and skittish as when roaming at large over the broad prairies, and as repugnant to civilized life, and the arduous labors attending it, as the untamed mustangs, which had never been brought under the control of the teamster's lash.

The first step in this process, was to construct a frame-work of timber, called the "stocks," consisting of four upright posts, connected by bars on all sides, and capable of containing a single mule. Near this was placed the blacksmith's forge.

The next step was to catch the mules, and place them in the stocks, a task of infinitely more labor than that of putting on the shoes. The mules were first driven into a *corral* or pen. The animal to be shod was then selected, and a lasso or rope thrown over his

head, by which he was drawn from the inclosure. Then commenced a series of kickings, and rearings, and boltings, a caution to all to keep out of the way, when, by the aid of several men, the victim was brought up to the stocks. Now came the most difficult part of the operation, that of getting him in. A mule is by nature timid, even when he has been used for years, and subjected to kind treatment; but if, when only half tamed, he is violently brought under control, this timidity is increased to actual fright, and he does not hesitate to ply his heels pretty vigorously. There is no species of defence belonging to the horse, no stubbornness peculiar to the ass, but are concentrated in the mule. He possesses the bad qualities of his paternal and maternal progenitors, with the good traits of neither. The gentleness, docility, and instinct of the horse, are not found in the race; while the capricious obstinacy of his paternal ancestor is exhibited to the fullest extent. There is one trait of his character, however, that should be noticed, and that is his power of enduring fatigue and privation, which renders him better fitted for the long inland journeys, where there is an insufficiency of food and a scarcity of water, than the horse.

The sight of the stocks, as might be supposed, would not tend to make a mule more tractable. Then begins the tug. The rear kick, the side kick, the forward plunge, are exhibited to the fullest extent. Several men get hold of the halter, while other ropes are passed round his rear, and thus he is finally drawn into the stocks. Bandages or straps are placed under his body, by which he is raised from his feet. His

head is secured between two wooden bars; and each foot, after a severe tussle, is fastened, by means of iron clamps, to the four upright posts or cross-bars. The victim is now ready for the shoeing process, which is the most expeditious part of the operation. The shoes having been previously brought to the size of the small hoofs, a blacksmith stands ready at each foot, with a shoe, nails, and hammer in hand. He does not then pause in order to make a close fit; but the shoe is put on in less time than a city farrier would spend in paring a horse's hoof. This part of the job being over, the finale of the operation is to haul the animal out, which, owing to the spirit of perverseness inherent in his nature, is generally attended with as much difficulty as that of getting him into the stocks. He is now suffered to go at large, unrestrained by the bars and rails of the corral. In this manner, about one hundred and fifty mules were shod; and, as only twelve at the most could be got through with in one day, about two weeks were necessarily spent in this portion of our fitting out for the march. Considerable time was also occupied in preparing the shoes, which were made in New York; and being adapted for the larger American mules, it was found necessary to reduce them all for the smaller and more delicately formed hoofs of our Mexican torments.

Believing it would be more advantageous to the members of the Commission whose presence was not necessary in the camp where the work alluded to was going on, and that it would be conducive to their health, I left Victoria on the 13th, with the larger portion of the Commission, and formed my camp in a

beautiful grove of live oaks, on the banks of the river Colette, a tributary of the Guadalupe, six miles distant. We were here away from the vices and mischief which invariably attend large parties without employment, when encamped in or near a town. We here had fine running water, in which we could bathe, a practice which greatly tended to promote health. The trees afforded us a fine shade; and, as the heat was still great, the mercury rising from 95° to 100° Fahrenheit, in the coolest places, we found it more comfortable beneath the trees than to remain in our tents. There was excellent grass in abundance all around us, where our animals could feed, and we quietly awaited the arrival of the train, to continue our journey.

Before setting out from Indianola, it was deemed advisable, for the safety of the party, in the long and dangerous march of more than eight hundred miles through a country infested by hostile Indians, to organize the members of the Commission, not engaged on surveying or other duties, into two military companies. This would place them all under the more direct control of the officers, and hence lead to a better subordination. With this view, the engineers and their assistants were formed into a cavalry corps, under the command of Lieutenant J. G. Strain, U. S. Navy; and the mechanics and laborers into a rifle corps, under the command of Captain Edmund Barry, an officer who had served in the army during the Mexican war. All were provided with rifles or carbines, and many of the cavalry with Colt's revolvers, or six shooters. Lieutenant Strain, by means of careful drilling at Indianola, on the march, and during our stay at Victoria,

brought his company into such a state of discipline, that it made a very respectable appearance. The saddles, bridles, and trappings, were the same as those of the U. S. Dragoons; the uniform, blue flannel shirts, dark pantaloons, and broad-brimmed white felt hats. The dress of the rifles was scarlet flannel shirts, the rest of the uniform the same as the cavalry.

The town of Victoria, which we have just left, is one of the most flourishing inland towns in Texas. It stands on the banks of the Guadalupe River, and, being in the midst of a fertile region, possesses a good trade. At the time of our visit, in September, 1850, it had three public houses, numerous stores, mechanics' shops of various kinds, a weekly newspaper, and a courthouse. The latter edifice always brings with it, in new countries, numerous accessories. The court was in session at the time of our visit, and appearances indicated that a good deal of law and justice was dispensed here. The house, being of limited dimensions, could scarcely contain those whom business brought here, and the numerous idlers who have a propensity for hanging round country courts. Many were therefore obliged to spend their time in the shade of the fences and trees near by; and when required as witnesses, the constables came outside the building and called out their names to the full extent of their lungs; a primitive mode of doing business, though attended with much more comfort for the witnesses, than if obliged to be pent up in a closely confined room for hours and days together. How the juries were disposed of I did not learn; they could not, at any rate, carry them out into the high grass, as was customary

in some of the new States of the West, when courts were first introduced.

Victoria is a place of recent growth, having been settled within ten years. The Guadalupe River, where it passes the town, is an insignificant stream; but its high banks bear witness that it is at times one of considerable magnitude. Attempts have been made to navigate it by means of a small steamer, but with indifferent success; and the difficulties attending the navigation of Espiritu Santo Bay, into which the river empties, will prove a serious obstacle to regular communication with the seaboard. I directed the quartermaster to transport the property of the Commission to Victoria by steamer from the coast; but finding it a very uncertain mode, and one which might be attended with serious delays, he thought it most prudent to make use of wagons, and such of our stores as exceeded our own means of conveyance were drawn with hired teams. As I did not pass through this place on my return, I do not know whether the attempt to navigate the Guadalupe with steamboats has been successful or not.

September 14th. The weather was extremely warm to-day, the mercury rising to 102° in the shade. Took an early breakfast, in order to examine the country around us before the sun was too high. The banks of the Colette are overhung with trees, from the branches of which hang long festoons of moss, waving gracefully with the breeze. The river is about 150 feet wide, and near our camp about five feet deep and quite sluggish. Saw many fine fish, among them the kind known as the "buffalo fish;" but it would not take the

hook. The largest ones seemed fond of lying near the surface of the water, which enabled us to shoot them with a rifle. They proved excellent eating.

The vegetation presents more interesting features as we proceed inland,—the river bottoms are well wooded with oaks, pecan, and huck-berry,—and the minor plants are more numerous. The peach and fig flourish well in the gardens near Victoria; but the season is so dry, that we have no vegetables except pumpkins,—even potatoes have disappeared.

In our walk Mr. Thurber gathered many plants; we also found the first appearance of rock that we had seen in Texas, near the banks of the stream. Near by was a Mexican ranch, which was then an object of curiosity, being the first of the kind we had met with. It was built of sticks set upright, the interstices filled in with mud. The floor was of the same material. The house contained but a single apartment, which was occupied by a Mexican, his wife, and several children. The pigs were rooting near the door. Several fowls were perched upon projecting sticks, or nestling on the beds; and we had ocular proof that they sometimes deposited their eggs there. Bought out the entire stock of eggs, and all the milk that could be spared.

September 15th, Sunday. Thermometer at 101°. Announced that I would read the church service at 9 o'clock, and invited all to attend. It was a source of gratification to find that the whole camp were present save the two men on guard. The service took place beneath the branches of a large tree, where we were sufficiently protected from the sun's rays. The chapter

read on this occasion was from the 20th Corinthians, giving the narrative of St. Paul's voyage and shipwreck, which seemed an appropriate one: a hymn was afterwards sung, in which the greater portion joined. This being over, all returned to their tents, or beneath the adjacent trees, and passed the remainder of the day in quietness. Much satisfaction was expressed at this observance of the Sabbath, and it was hoped that it might continue to be thus kept during our long march.

September 16th. The weather continues hot, the mercury reaching 99° to day, which of course kept us quietly in camp as before. Early in the day I set off with my gun in search of game, but was unsuccessful in finding any thing but a few quails: the prairie fowls which were so abundant on the great plain between Victoria and Indianola had disappeared.

A calf was killed and brought into camp by one of the men, who declared that he took it for a deer; and a few hours after several claimants appeared demanding pay for the animal. They did not come together, nor did either of them know that there were other applicants besides himself. The first, on my questioning him as to the color of the calf, said it was *black*. The next one said it was *red*, and a very valuable animal, more so indeed than a full-grown ox. A third declared it to be of some other color. I expressed my willingness to pay for the slaughtered innocent if I could know its rightful owner, and requested the several applicants to call on me again towards evening. In the mean time I sent for the skin, which was not found to correspond with the description given by either of the claimants, whom I then dismissed.

The wagons and mules continued to arrive at the camp; but when I was expecting soon to move, I learned that Colonel McClellan was seriously ill at his quarters in Victoria. So ill was he that many feared he would be unable to continue the journey. Dr. Bigelow, surgeon of the commission, remained to attend him.

While we lay here waiting for the remainder of the party, the wagons were overhauled, reloaded, and some additional teams added by purchase. Not being able to get all we wanted, a few were hired to aid in transporting the stores to San Antonio, where the quartermaster expected to complete his purchase of wagons and mules.

September 20th. Colonel McClellan having so far recovered as to join the camp, I gave orders to move to-morrow morning at daylight. Every thing, therefore, not absolutely necessary, was stored in the wagons, and preparations made for an early start.

September 21st. The bugle sounded at half past three o'clock; breakfast was dispatched before the sun had risen; and ere the morning mist, which, arising from the river, hung over our camp, had disappeared, we were on our way. The morning was cool and pleasant, and I was desirous to reach our proposed camping spot before noon. This was the first day's march of the whole party; and as the wagons were heavily laden, I did not think it best to press the animals too much at the start.

Our route was over a country of alternate prairie and woodland, with an excellent road. After a march of fifteen miles, the main body encamped at Manahuila:

while I with a small party rode on five miles further to Goliad, having some business to transact at that place, which I reached at 12 o'clock. Here I found Mr. F. Wheaton and Mr. Scott, assistants in the surveying party, who had been taken ill and were obliged to remain behind.

Towards evening Judge Lea, a gentleman of enterprise and a large landholder, called on me and invited me to his house at Old Goliad about two miles distant. He took a deep interest in the survey we were then making from Indianola to San Antonio, and had accompanied the surveying party when it passed through his lands a day or two before my arrival. Crossed the river in a log canoe, and reached the Judge's residence, a venerable and ruined church, just at sunset. Took a brief view of the ruins of the ancient town while the dim twilight remained.

The present town of Goliad is about two miles from the former town, and at the time of my visit contained about two hundred inhabitants. The old place, which is now in ruins, is situated upon a hill directly upon the west bank of the San Antonio River, at its highest navigable point, and formerly contained several thousand inhabitants. It was originally a Spanish Mission, instituted for the purpose of christianizing the Indians, and united within one inclosure a church and fort, while numerous dwellings were clustered under the protection of its guns. The date of its establishment is not known with certainty, the accounts varying from one to two hundred years. The church is the only building in any tolerable preservation, except two or three houses which have been restored, provided with

new roofs, and made into very comfortable dwellings—better, indeed, than modern builders would think of erecting. The church seems to have been designed for the double purpose of a church and a castle. Its massive walls on every side, which measure four feet in thickness, are cemented with waterlime; and to its great strength is owing its fine state of preservation. Its extreme length is 90 feet, its breadth 27 feet. Its roof is a single stone arch from wall to wall, sustained by small buildings or cloisters which project from the sides, and which are connected with the main edifice; a parapet rises above the roof, behind which cannon were formerly planted.

In the various domestic wars of Mexico this was an important place, and frequently changed hands; nor was its importance lost during the struggle for Texan independence, when it was occupied by the Mexican as well as the Texan forces. Its original name was La Bahia del Espiritu Santo, the Bay Town of Espiritu Santo, because it was originally the place for collecting the revenue of the small ports upon the bay. Hence all persons arriving on the bay with merchandise were obliged to go forty miles into the interior to find the officer of the customs, to whom they had to pay their duties. Similar inconveniences exist at the present day in Mexico, on the Pacific coast: the collector of the port of Manzanillo, for instance, resides at the city of Colima, ninety miles in the interior. This name of La Bahia was changed by the Spaniards about thirty years since, when it began to decay as a religious establishment, to that of Goliad, on account of its great strength.

Around the church are some twenty or more ru-

ined buildings of stone, with nothing but their walls standing. One of these extends about 150 feet southward, and appears, from its small apartments, to have been constructed for barracks: its walls, like those of the church, are very massive. A high wall seems once to have surrounded the church, but much of it now lies prostrate. The other buildings, which are detached and of various dimensions, were chiefly used as dwellings. The whole town is in ruins, and presents a scene of desolation, which to an American is at once novel and interesting. Each succeeding capture, of course, impaired the buildings; and after the decisive battle of San Jacinto, the Mexicans evacuated it and destroyed it as far as they were able. The material of these buildings is a soft white sandstone, which underlays the town, and which appears to become hardened when exposed to the air.

We enjoyed the hospitalities of Judge Lea, who is domiciliated in the old church, the interior being in good condition. To this gentleman we are indebted for many facilities for visiting the ruins, and for much information respecting the country adjacent. He had partitioned the church with a slight frame-work about ten feet high, which was covered with calico or brown cotton, the top being open; making it a very comfortable place for the greater portion of the year. After tea we ascended to the roof, to enjoy the cool breeze of the evening, and the beautiful landscape which there opens to the view. Situated on an eminence, the country can be seen for a great distance around. After the moon arose and cast a deep shadow from the ruined walls, and the long belt of fire from the burning prairie

shed its red glare on the few clouds that flitted across it, the scene assumed an aspect of peculiar solemnity and interest. We lingered long to enjoy the fairy-like vision, and until the fatigues of the day warned us that it was time to retire.

The sword has truly given place to the ploughshare here ; and the inclosure which has been the scene of many a bloody fight, is now employed by the Judge as an experimental garden, in which he has demonstrated the capacity of the soil and climate to produce any of the great Southern crops of cotton, corn, and sugar, as well as the choicest garden vegetables. The church is especially notorious as having been the place where Fannin and his men were confined and massacred. We were fortunate enough to meet with a gentleman, Judge H., who was one of the prisoners, and whose singular escape may be worth relating.

After the battle of Perdida Creek, between Fannin and 275 men on one side, and Urrea with 900 Mexicans on the other, articles of capitulation were signed, according to which, those who surrendered were to be treated as prisoners of war, and either released on parole or sent to some port upon the bay. The articles were drawn up within the Texan lines, and all was arranged in good faith. The prisoners were confined within the fortress of Goliad, where they met others of their countrymen, sufficient in number to make up four hundred. When Santa Anna was informed of their capture, he sent orders for them to be shot. The officers in command remonstrated, but the order was repeated peremptorily. The massacre took place upon the 27th March, 1836, eight days after the

battle. The prisoners were marched out of the fort in three divisions, full of high expectations that the time of their release had arrived, and were shot down almost simultaneously by the Mexican soldiery. The gentleman above referred to was in the second division, and owes his escape to the most wonderful presence of mind. As his division was marching out, he heard the report of the muskets, which were fired upon the preceding division. Instantly the truth flashed upon his mind, and his course of action was decided. As he saw the lips of the Mexican officer move to give the order for the soldiers to fire, he fell upon his face as if dead. The soldiers stood within six feet of the prisoners, and fired with fixed bayonets. As soon as they had fired, they rushed upon the victims with their bayonets to complete the slaughter. Judge H. was pierced through the shoulder, bearing the wound without showing signs of life. After the execution, the scavengers and camp followers came to rob the dead. A Mexican, in cutting away his hunting shirt to get at his coat which was beneath, wounded him in the neck, at which he let escape some expression of pain; whereupon the Mexican, finding him still alive, beat him upon the head with the butt of his escopetto until he supposed life extinct, and then went on with his robbery. All this time the Judge retained a consciousness of his situation; and when all had left the bloody scene, he crawled, as well as his remaining strength would allow, to some concealment near the river, and at dark made his escape. After wandering three days without food, he obtained assistance from some kind-hearted Mexicans, and finally reached the coast in safety.

As near as can be ascertained, about 375 Texans fell victims to this treachery. They are all buried in one common grave, with no other monument than the prison's ruined walls.

The situation of Old Goliad is well chosen, and from the top of the old church a view of surpassing beauty is obtained. The fertile valley of the San Antonio lies below; and all around the land stretches away in gentle undulations, not densely enough wooded to form a wilderness, but bearing here and there clumps of trees, disposed so regularly as to give the landscape a rural aspect. So closely do the clusters of live-oaks resemble orchards, and the recently burnt prairies, with the newly-springing grass, meadows, that one finds it difficult to convince himself that he is not passing through a highly cultivated district. Upon the opposite side of the river are the ruins of another mission—the Aranama—named from a tribe of Indians now extinct. This building, like the church before described, was surrounded with the ruins of lesser ones. It is of smaller dimensions than the one tenanted by Judge H.; but with restored walls, openings for windows, and a modern roof, it has been changed into a comfortable dwelling. It is occupied by a gentleman from New York, who lives in a style of elegance that we were quite unprepared to meet with in Western Texas.

Visited to-day the camp of Mr. Bull, a portion of whose party was near Goliad. They had made good progress with their survey; but, though they had met with no serious obstacles, had suffered much from the intense heat on the open prairies, where

they could obtain no shelter from the mid-day sun. Joined the train, and moved on six or eight miles, to the banks of the Cabeza, a small stream, and encamped in a grove of trees near by.

September 22d, Sunday. Remained in camp. The grass being excellent, our animals had the advantage of good feed. Held service beneath a large tree, which was attended by the greater portion of the Commission.

September 23d. The cooks were called at three o'clock, and our breakfast dispatched by the break of day. This enabled us to move by five o'clock, and to reach our intended place of encampment, known as the *Ojo de Agua*, or Water Eye, before noon.

September 24th. Left at five o'clock, and after travelling over an excellent road, reached the Sebilla River, a rather diminutive stream to receive the appellation of river, and encamped upon its banks. Distance travelled, twenty-one miles.

September 25th. Took an early start, as usual. More timber appeared, and of a larger growth than we had observed towards the coast. The live-oak in particular, which had been of a stunted or dwarfish appearance, now assumed the stateliness of northern latitudes. Our ascent was more perceptible to-day than any day since our departure from the coast. Reached the San Antonio River at ten o'clock, and pitched our tents near a cluster of Mexican ranches. Distance travelled, seventeen miles.

A sad event occurred in camp this afternoon, which resulted in the death of one of our Mexican neighbors, who had been furnishing us with meat and other arti-

cles. While sitting in my tent in the afternoon, I heard the report of a pistol quite near, and immediately after saw a number of men and women running towards one of the ranches. I hastened to follow, and found a man lying on his back with the mark of a gun shot in his breast, which I was told had been inflicted by one of our teamsters named Green. The wounded man appeared to be about thirty years of age, and was surrounded by his father, mother, wife and four children. His brothers and sisters were also around him. Doctors Bigelow and Webb were in immediate attendance, and rendered all the aid possible. But as they pronounced the wound a mortal one, but little could be done for him, and he died in two hours.

The particulars of the murder were briefly these: While Green, the teamster, was gathering wood, he attempted to take some portion of a fence; when the deceased, who owned the farm and wood, ordered him off, at the same time drawing a jack-knife and pointing it towards him. Green dropped a portion of the wood, and returned to his fire with the remainder. He then took his pistol, a large revolver, and came back for the wood he had dropped. The man who had ordered him off was still there, and approached Green with his knife open. The latter, when within three feet of him, leisurely drew his pistol and discharged it at the Mexican's breast. The wounded man ran towards his ranche, but fell before he had reached the door.

I immediately caused Green to be arrested; though I found that during my visit to the ranch, he had been to my tent to confess the deed. He came for-

ward at once, and related the facts as previously stated to me. My intention was now to keep a guard over the prisoner, and deliver him to the authorities on our arrival at San Antonio; for which purpose he was placed in a tent, with two men to guard him.

I stated to the family that the prisoner should be delivered to the authorities for trial, which in a measure pacified them. But for this, an attempt would doubtless have been made to take his life, word having been sent to the neighboring ranches of the occurrence. The man, I told them, was not a member of the Commission, but a Texan teamster, hired at Indianola. Afterwards, learning the poverty of the family, that the deceased was its main stay, and that the expense of the funeral would be great, I gave the father one hundred dollars.

During the evening, before the guards had been posted, and while our people were moving to and fro, the prisoner raised the back of the tent, unseen by the guard and others who were sitting near the entrance, crept to the outer lines of the camp, leaped on a horse which was staked near, and escaped under cover of the darkness. No more was heard of either horse or rider, though it was believed that some of the friends of the teamster had aided him in making his escape.

September 26th. Our march to-day brought us to the Cibolo (corrupted by the Texans into Sea-Willow) River, where we encamped.

September 27th. Took an early start, and reached the city of San Antonio at two o'clock, distant twenty-one miles. Having much to attend to in

completing the outfit of the party, I took up my quarters at the Verandah Hotel, while the rest of the Commission encamped on the banks of the river, about four miles from the city. Colonel Craig, with the escort, had not been with us on the march from Indianola. As no protection was yet required, he proceeded, immediately on landing at that place, to his camp near San Antonio, where his train was preparing for him.

September 28th. Another sad event took place to-day. In making up the party for our journey to El Paso, it was necessary to procure teamsters in Texas, no men having been engaged at the north for such duty. When we started from Indianola, four or five persons who had been engaged for other duties undertook to drive teams. All the others had to be procured there or at Victoria; and the quartermaster was obliged to take such men as he could find, giving in all cases the preference to such as had been in the government employ, or who could bring good recommendation. But with all his care, several desperate characters were engaged. One of these, named Turner, had had a quarrel with Mr. Tennant, the butcher in the employ of the Commission, a very worthy man who had accompanied us from Washington. In the camp to-day they were seen having high words. Turner, it appears, had endeavored on several occasions to get the former into a fight without success. To-day Tennant was heard to say that he had no fears of Turner, if he would lay aside his knife and other weapons, and fight him fairly; at the same time drawing a small knife from its sheath and throw-

ing it from him. No sooner was this done, than Turner drew his long bowie-knife and rushed upon him, plunging it into the side of Tennant, and causing his death in half an hour. The murderer sheathed his knife, and hastened to a horse which stood near. In another moment he was mounted, and, riding at full speed, he disappeared in the thick chapporal, or thorny bushes, near the camp.

This transaction took place in the very midst of the camp; but as broils and altercations were not uncommon among the teamsters, and as no one anticipated what was to follow, Tennant being a very athletic man, they did not interfere. In fact, from the statements made to me, the affair was so sudden that it scarcely admitted of any interference. But the blow of the murderer, and his subsequent escape, were witnessed by many. The whole camp was immediately in motion; horses were saddled, and several started in pursuit. The chapporal was high and thick; yet the pursuers, regardless of the difficulty and danger of riding through its thorny recesses, dashed on, and soon caught sight of the object of their pursuit. In a short time the two foremost of the party, Mr. Robert E. Matthews, and Mr. J. E. Weems, assistants in the engineer corps, succeeded in overtaking Turner, when, presenting their pistols, they compelled him to surrender. Having been disarmed, and others of the pursuers coming up, the prisoner was carried in safety to the camp. Great credit is due to Messrs. Matthews and Weems for their activity and courage in capturing this desperate man.

A detachment from the engineer corps brought

their prisoner to me at San Antonio, and I immediately placed him in the hands of the sheriff of the county. Soon after, I saw him lodged in jail and handcuffed.

Although this affair did not attract much public attention, such things being of frequent occurrence at the time, yet, among the class to which the murderer belonged, there was much excitement, and threats were heard that an attempt might be made during the night to effect his release. The prison being an adobe building and quite insecure, I deemed it my duty to detail a guard of six men from the Commission to the jail for the night.

The following day an examination took place before the mayor, the Hon. J. M. Devine. Many witnesses were examined; and the result was the committal of the prisoner, to take his trial for murder. I learnt some months after that he was found guilty, and sentenced to fifteen years imprisonment. He remained in prison about two years; but on my return from the survey, I heard that he had made his escape.

Murders were common in Texas about the time of my visit in 1850; and it had been too often the case that the guilty escaped justice. At this time the laws were better executed; and now (1853) there is as much security for life and property as in the older States of the Union. Frontier States often contain a bad population, at least such is the case in their early history. At the time of the annexation of Texas, large numbers of vicious and worthless men, some of whom had committed crimes and eluded the hands of justice, had sought a home here, where law and order had not then been firmly established: life and property were little regarded by them. But since the laws have come to be

more rigidly enforced, these desperadoes have found it necessary either to adopt more honest modes of living, or to take refuge on the very borders of Texas and New Mexico, where they can pursue their old courses with impunity, by crossing over when necessary into Mexico.

My servant who was taken ill on the march up, here died of fever: several others were attacked, but soon recovered.

As San Antonio was the last place at which supplies could be procured, and the train fitted out for the long march of nearly 700 miles, it was necessary to make it as complete as possible. We yet required a large number of mules and many wagons to transport the public stores, which had been sent forward in hired wagons. The quartermaster therefore found it necessary to increase the train to about 56 teams, which included sixteen Mexican carts, the latter drawn by three yoke of oxen each: some of the wagons, too, were of the largest description, and drawn by ten mules or five yoke of oxen. These, with some additional riding animals, and their equipments of saddles, bridles, etc., completed the means of transportation for the Commission and its stores.

We also procured here about a hundred head of beef cattle, to be driven with the train, and used on the march. The draught oxen I also intended to fatten after our arrival in the field of operations, for a future supply of beef; so that we were pretty well provided in this department of our subsistence. A few barrels of pork and some small stores were also added to our stock here: some additional arms, ammunition, tents, and camp equipage, finished our outfit.

From the lateness of the season there was an uncertainty about grass; furthermore, by the recent arrivals from El Paso, I learned that the prairies had been burned by the Indians a considerable portion of the way, and that it would be absolutely necessary to transport a considerable quantity of corn to keep the animals in good trim, and enable them to cross the desert portions of the route. The quartermaster, therefore, sent in advance to the military post on the Leona, 90 miles distant, several wagon-loads of corn, and made arrangements to carry as much in the train as possible, without overburdening it. In these various preparations, and the shoeing of the additional animals, about two weeks were spent. During this time the party remained encamped at the San Pedro Springs, about a mile and a half from the town. These springs, of which there are several, gush out of crevices in the limestone rock; and their united waters form a small river, which runs through the town, and unites with the San Antonio three or four miles below it.

The view of San Antonio from a distance, as it is approached by the Victoria road, is exceedingly beautiful. The place seems to be embowered in trees, above which the dome of the church swells with an air quite Oriental. But this pleasing impression is soon dissipated on entering the town, and making one's way among the filthy buildings of the Mexican suburbs to the plaza, or public square. The town is a strange mixture of massive old Spanish buildings and recent American structures. But upon the plaza the modern buildings have for the most part superseded the ancient; though some few remain, seeming lost

and out of place in the company of their smart-looking neighbors. The old church still occupies its prominent position in the plaza. This is a building characterized rather by solidity than beauty, and has as much the appearance of a citadel as of a church. Indeed, during one of the battles of the war of Texan independence, it was occupied by the Mexican troops, and its tower still bears the scars made by the cannon balls of the besiegers.

San Antonio is delightfully situated. The rivers San Antonio and San Pedro run through the place. The latter is a small stream, and with us would hardly be dignified with the title of river. The San Antonio is much the larger of the two. It rises about three miles from the town, from a number of large springs, flowing, like those forming the San Pedro, from the solid rock. The largest of these is worth a visit. The water rises in a cavity some six or eight feet in diameter and twelve or fifteen feet deep, and rushes out in an immense volume. The water of these springs unite with Olmos Creek, forming a river, which, in its course towards the sea, receives the Medina, Salado, Cibolo, and other tributaries, and finally, uniting with the Guadalupe, empties into Espiritu Santo Bay. The San Antonio is capable of affording immense water power. At present, in its course through the town, it turns but one wheel, and that simply by the flow of the current.

San Antonio contains about 6000 inhabitants, of which number it is estimated two thirds are Mexicans, Germans, and French. Yet, notwithstanding this preponderance of other nations, the town is es-

entially American in its character. Mexican indolence cannot stand by the side of the energy and industry of the Americans and Europeans; and the new comers are rapidly elbowing the old settlers to one side. Some few of the Mexicans have the good sense to fall in with the spirit of progress; but the great majority draw back before it, and live upon the outskirts of the town in the primitive style of their forefathers.

Situated in the centre of a rich agricultural region, San Antonio is destined to be a place of much importance. The necessity of a railroad communication with the coast is severely felt, and energetic movements are making to establish it. At present the supplies of merchandise are brought from the coast by the slow medium of ox carts. These are driven by Mexicans, and in a favorable condition of the roads make the trip in six days. The business of freighting almost entirely supports the Mexican population of the city and its vicinity. The American people are too much imbued with the spirit of progress to engage in any business that partakes of the past. The idea of carrying on commerce with ox carts, and making 130 miles in six days, over an excellent road, might do for the past century, not for this steam and lightning age.

Large trains frequently leave here for El Paso, Eagle Pass, and other points on the Mexican frontier, and often penetrate to Chihuahua, Parras, and other Mexican cities. Those engaged in the Mexican trade are beginning to see the advantages the route through Texas possesses over the long one from Missouri, by

way of Santa Fé; and doubtless ere long all merchandise for the northern part of Mexico will pass this way.

One of the principal objects of interest to the stranger in San Antonio is the Alamo, memorable for its brave defence by Travis, Crockett, Bowie, and others, who only gave up the contest with their lives. The building was originally a mission. It is now occupied as a storehouse by the United States Quartermaster's Department, and retains but little of its former appearance. The principal doorway, ornamented in the Moorish style, remains tolerably perfect.

We saw in the County Clerk's office a large collection of old Spanish documents, which have been accumulating ever since the first settlement of the town. Doubtless their careful perusal by some persevering antiquary would develop many interesting facts connected with the early history of the country. It is to be hoped, that measures will ere long be taken by the enterprising State to which they relate to rescue them from oblivion and decay, and cause them to be collated and given to the world. The Northern States have spent immense sums in sending agents to England, France, and Holland, to procure similar papers from the State archives to illustrate their Colonial history. Texas possesses in her own record offices voluminous documents of equal value, in which the scholar and historian of every State feels an interest second only to that of her own people.

Near the town and upon the banks of the San Antonio River are the remains of extensive mission establishments. We found time to pay a short visit to

those of San José, San Juan, and Concepcion. There is another, La Espeda, which we did not visit.

A ride of about five miles through a mezquit country brought us to the mission of San José, situated upon the right bank of the river. This was the largest and wealthiest mission; and its buildings were constructed with greater display of art, and still remain in better preservation, than the others. Entering the in-

Mission of San José, Texas.

closure formed by the granary and other out-buildings, we alighted in front of the main edifice or church. This is constructed of stone, and plastered. The principal doorway is surrounded by elaborate carving, which extends the whole length of the front, and includes numerous figures, among which San José, the patron of

the church, and the Virgin and Child are conspicuous. The material of this work has the appearance of stone ; but we found on examination that it was a hard kind of stucco. The action of the weather has done much to destroy the figures ; and the work of ruin has been assisted by the numerous military companies near here, who, finding in the hands and features of the statues convenient marks for rifle and pistol shots, did not fail to improve the opportunity for showing at the same time their skill in arms and their contempt for the Mexican belief. That portion of the front of the church not covered with carving, was ornamented with a sort of stencilling in colors, chiefly red and blue. But few traces of this have withstood the rain. The most perfect portion of the church is an oval window in the sacristy, which is surrounded with scrolls and wreath-work of exceeding grace and beauty.

The interior presents but little of interest. The dampness has destroyed the frescoes upon the walls, and the altar has been stripped of its decorations. It is now seldom used for religious purposes ; as the Mexicans of the neighborhood are poor, and cannot often afford the fifty dollars charged by the San Antonio priests for officiating.

The convent in the rear of the church, as that portion of the building occupied by the fathers is called, remains in tolerable preservation, and is at present inhabited by an American who cultivates the adjoining lands. A fine view of the surrounding country may be had by ascending the tower, which is accomplished in part by means of a spiral staircase, and in part by a rude ladder, consisting of a stick of timber with

notches cut in its sides. The plan of the building evidently included two towers; but only one of them was ever completed.

About two miles below San José, and upon the opposite side of the river, are the ruins of San Juan. This was never a building of much pretensions, and is in a more ruinous state than San José. The interior shows the remains of some exceedingly rude paintings; and we noticed that the earthen floor was broken up in several places where graves had recently been made.

It was late when we reached Concepcion, which is

Mission of Concepcion, Texas.

nearer the town than either of the other missions. The two towers and dome of the church make quite an imposing appearance when seen from a distance; but

on approaching it, we found it not only desolated but desecrated; the church portion being used as an inclosure for cattle, the filth from which covered the floor to the depth of a foot or more. Myriads of bats flitted about, which chattered and screamed at our invasion of their territory; and we found nothing of interest within the church to repay us for encountering their disagreeable presence.

CHAPTER III.

SAN ANTONIO TO FREDERICKSBURG.

Advanced party formed for the journey to El Paso—Arms and equipments—Mode of travel—General order—Storm on the Prairie—Guadalupe river—Refinement among the German settlers on its banks—Terraced hills of Texas—Mormons in the valley of the Piedernales—Fredericksburg.

THE long though necessary delay in getting the train ready to move, and the slowness with which it would probably proceed, convinced me that it would not be possible for it to reach El Paso on the first Monday of November, the 4th of the month, the day fixed upon for the meeting of the Joint Commission. After advising with General Brooke, Colonel Johnston, and others, as to the practicability and safety of my proceeding in advance with a small party, I came to the determination to do so, and announced my intention to the members of the Commission, requesting to be notified of such as would volunteer to accompany me. The whole would willingly have gone, although the proposed journey would be attended with severer duties and considerable danger, as we should not have the advantage of a military escort, which must remain with the main body of the Commission and its stores.

I selected the following gentlemen for the advance party.

THOMAS H. WEBB,	<i>Sec. to the Joint Commission.</i>
ROBERT C. MURPHY,	<i>Asst. Secretary and Clerk.</i>
GEORGE THURBER,	<i>Botanist and Commissary.</i>
THEODORE F. MOSS,	<i>Geologist.</i>
JOHN C. CREMONY,	<i>Interpreter.</i>
EDWARD C. CLARK,	<i>Quartermaster.</i>
ROBERT E. MATTHEWS,	<i>Assistants in the Engineer and</i>
JOHN B. STEWART,	“ <i>Surveying Corps.</i>
THOMAS THOMPSON,	“ “ “
S. P. SANDFORD,	“ “ “
J. THOMAS McDUFFIE,	“ “ “
THOMAS DUNN,	“ “ “
GEORGE G. GARNER,	“ “ “
J. E. WEEMS, JR.,	“ “ “
CLEMENT YOUNG,	“ “ “
C. NEVILLE SIMMS,	“ “ “
GEORGE S. PEIRCE,	“ “ “
A. P. WILBAR,	“ “ “

R. B. SMITH, *Mason*; G. W. MILLER, *Blacksmith*; WM. GARRATT, *Harness-maker*; WILLIAM FERGUSON, *Carpenter*; THOMAS BRIGGS, *Tailor*. These with *cooks, servants, hunters, and teamsters*, making altogether thirty persons, constituted the party.

The main body of the Commission, which did not leave until several days later, intended taking the Southern route, which had been more travelled and was better known than the Northern one, by the way of Fredericksburg. But with the advice of those who had lately come over the Northern route, I determined to take that. The distance was said to be about thirty

miles less, and there was a prospect of finding better grass.

October 10th. Although orders had been given to have every thing in readiness to start early this morning, on going out to the camp on the San Pedro, I found the train was not ready. Being determined to move if I did not get a mile, and the wagons having at last been geared up, we took leave of our friends at 4 o'clock in the afternoon, and reached a pool of water four and half miles distant just before dark.

My train now consisted of six wagons, each drawn by five mules, and my carriage by four: the latter was what is called in New York a Rockaway. It was a large vehicle with close sides and windows, and so arranged that it could in a few minutes be turned into an excellent sleeping place; it was so occupied by me during the whole journey to El Paso. It might also with propriety be termed an armory, and did receive that appellation from the number of fire-arms contained in it. First, there was suspended at the top a double barrelled-gun, while to one of the uprights was affixed my rifle, one of Sharp's repeaters; a heavy revolver, one of Colt's six-shooters, was strapped to each door; and Dr. Webb (who rode with me) and I were both provided with a pair of Colt's five shooters. My carriage driver carried a pair of Deringer pistols. We were thus enabled, in case of necessity, to discharge a round of thirty-seven shots without reloading; besides which, Sharp's rifle could be fired at least six times in a minute. I also carried a spy-glass, barometer, lantern, and a variety of tools and other articles which we had constant occasion for on the road. The rest of the party were mounted

on horses or mules, and I occasionally resorted to a mule by way of variety ; for it is a dull mode of travelling to be dragged slowly along for eight or ten hours a day cramped up in a carriage. I also made it a point to walk a few miles every day on starting, which practice was followed by others.

Every man in my party was well armed, the officers with Colt's revolvers and a rifle ; the mechanics, laborers, cooks, and servants, with rifles, and the teamsters with pistols or rifles.

We seldom moved at a faster gait than a walk ; as I did not wish to run the risk of fatiguing the mules or breaking them down, while the feed was scanty, and there were no means of making good any losses of animals. By setting out at 7 o'clock, which was as early as we could get off on an average, we could make about twenty miles by two o'clock, which gave the animals time to graze before night, when it was necessary to bring them all in. An earlier start might have been made, but the animals had to be fed first ; and when there was good grazing, they were turned out at daylight for the purpose.

On leaving camp, one half the horsemen took the lead as an escort ; for the timid mules are always reluctant to lead off, and do much better when a horse is in advance. I followed with my carriage, when not mounted on my mule ; the train of wagons came next, with a few horsemen alongside ; and the cooks, servants, etc., brought up the rear.

On reaching a camping ground, we formed what is called on the prairies, and by all overland travellers, a *corral*, or inclosure, to serve as a protection for men

and animals. When there is a good number of wagons in a train, a very large inclosure may be formed, sufficient to contain the tents and all the animals; but my small train of seven vehicles was too limited for that: the wagons were therefore arranged in a semicircle, and the tents pitched along the base. After the animals had been "*corralled*," a stout rope was drawn across in rear of the tents, to prevent their escaping should any get loose. When the ground would admit of a large *corral*, the animals were staked inside, but they were generally made fast by halters, or *lariats*, to the pole of the wagons for the night; and in this position, corn was fed to them when we had it. The following order was issued on leaving San Antonio :

" General Order for the government of the Advance Party of the U. S. Mexican Boundary Commission, on its march from San Antonio to El Paso del Norte.

"As this portion of the Commission is entering a country inhabited by warlike tribes of Indians, where no resources can be had beyond what the prairies supply, it is absolutely necessary that a rigid observance be kept of the following order :

"The same organization of the cavalry company formed at Indianola, will be continued to El Paso.

"Mr. Geo. S. Peirce, commanding the cavalry, will act as master of the camp, detailing for the guard whatever force may be deemed necessary for the safety of the train.

"Every member of the Commission, the teamsters and cooks excepted, is expected to do guard duty.

"The train and escort will keep as close together

as possible; and after leaving Fredericksburg, no one will be permitted to leave the train beyond a short limit.

“ Mr. Cremony will take charge of the ammunition, inspect the arms, and report in what manner every man is armed. Economy must be used in the ammunition, as the quantity in the train is limited.

“ As there is one *jornada* of seventy miles without water, and we may suffer inconvenience elsewhere, every man who has not already provided himself with a canteen or gourd, will do so before leaving Fredericksburg.

“ In case of any difficulty or accident to the wagons, it is expected that every one will lend all the aid in his power to remove it, and hasten the movement of the train.

“ Mr. E. C. Clark, the acting quartermaster, will arrange the encampments and direct the distribution of the forage. It is absolutely necessary that there should be an equal distribution of corn, and no one will be permitted to take more than is assigned or delivered to him. On this depends the safety of our animals, and consequently our own. A limited quantity of corn can only be taken, and great economy must be used in its distribution.

“ On coming into camp, holes must be dug for the fires, which must, when the ground permits, be placed in hollows, or beneath a hill, in order to conceal the encampment as much as possible.

JOHN R. BARTLETT,
Commissioner.”

IN CAMP, NEAR SAN ANTONIO, October 11, 1853.

The weather on the first evening was so warm and pleasant, that the young men did not pitch their tents, but bivouacked for the night. One was afterwards set up for the botanist and geologist, who had some labor to perform. About midnight, one of those sudden storms arose, which are so common in this region: the rain fell in torrents, the wind blew with violence, the thunder re-echoed from the hills, and the vivid lightning showed our tentless party in a very sorry plight. A few sought shelter in the only tent that was pitched; but scarcely had they got ensconced within, when a stronger gust than usual drew the pins from their fastenings and laid the tent flat upon the ground. As there was no other shelter near, they had no alternative but to lie soaking in their wet blankets till morning. I feared that this rude exposure at the outset would be attended with unpleasant consequences; but all were up early and ready for the march in the morning.

October 11th. Deferred starting until 9 o'clock, in order to give the party time to dry their clothing. The road was exceedingly heavy in consequence of the rain, which kept falling at intervals during the morning. The country, since we left San Antonio, consists of low hills, with broad intervening valleys, and is covered with rich mezquit grass. Clusters of live oak abound in the valleys, while the hills are comparatively bare of trees. Left the road with my mule and ascended a high conical hill on the left, from which I had a fine view of the surrounding landscape. Limestone seems to prevail here, and much of it crops out of the ground on which the road passes, making it exceedingly rough for the wagons. A very little labor

would make the road a good one; but most of the roads in Texas are so good naturally, that the idea of improving such portions as really need it, seems never to have been entertained. Reached a well known watering place called the Comanche Spring, over which a stone building has lately been erected. Several German families reside here, who have brought their lands into a fine state of cultivation.

October 12th. Morning quite foggy. The roads very heavy and stony, and the country of the same character as that passed over yesterday. Open grassy plains occur at intervals, with clumps of live-oak, giving a cheerful and picturesque appearance to the landscape. Passed the dry bed of a stream, in following which we spent an hour waiting for the train to come up. Mr. Thurber collected some specimens of plants, among them several species of Euphorbia. First noticed the Sycamore to-day. The prevailing timber continues to be live-oak. Reached Sabine Creek at 3 o'clock, p. m., where we encamped after a very hard day's march, our mules showing much fatigue. The margins of the creek bore cypress trees of large size, and great beauty of foliage. This is the last place at which we saw the palmetto. The bright flowers of the *Lobelia cardinalis* were abundant.

October 13th. An express from Quarter-master Myer arrived at midnight, informing me that in consequence of a further call upon him for horses for the party, and to meet other demands, he should require more funds. The messenger waited till after breakfast, when he was dispatched to the quarter-master with the requisite drafts.

Crossed Sabine Creek, and found both the descent and ascent very bad. The banks being high, we had to follow the bed of the stream over huge rocks, which I feared would disable our wagons. But by dint of pushing and lifting, and hitching horses ahead of the mules, we succeeded in getting across and on the opposite bank without accident. Bits of rolling prairie, covered with luxuriant grass, with here and there a clump of live-oaks, continued as before. Limestone frequently appears above the surface. On reaching the Guadalupe River, we stopped at the log houses of a small German colony. Among these, I was not a little surprised to find one occupied by a gentleman of learning and taste, with a choice library of scientific books around him. In chemistry and mineralogy, his collection was particularly rich; and even in other departments of natural science, as well as in history, voyages, and travels, it would have been a very respectable one in our large cities, where books are easily procured. Some good pictures, including copies from Murillo, evinced his taste in the fine arts. There was no floor or glass windows to this humble dwelling, and as much daylight seemed to come through the openings in the logs as through the windows. A plank table, chairs covered with deer skin, and a rude platform, on which was spread a bed filled with corn husks, but destitute of bed-clothes, constituted the furniture. The walls were covered with books, except one spot, where were arranged twelve rifles and fowling pieces of various kinds, with other paraphernalia of a genuine sportsman; while here and there, jutting out from a projecting corner or log, were sundry antlers,

evidence of the skill of the occupant. For want of closets and drawers, these antlers served to hang his clothes on.

On entering this primitive dwelling, we found its owner, Mr. Berne, busily engaged upon his meteorological table. He received us with kindness and suavity of manner; and we found him, as well as several others of his countrymen who had entered, communicative and intelligent. They had been here two years, and formed part of a large colony of Germans, who had settled in the vicinity. By invitation, we called at an adjoining house, equally primitive with that before described. On the rude walls hung some beautiful pictures, while other articles of taste, and a cabinet of minerals, had their appropriate places. Here, too, was a fine harpsichord, from which we were treated to selections from the most popular composers, played with an expression and feeling which indicated a master's hand. In the yard were some fine merino sheep; and while we were listening to the conversation of our friends, a tame peccari thrust his long nose against me to receive my caresses, much as a faithful dog would. But the propensities of the swinish family, to which the peccari is closely allied, were so strongly exhibited in this specimen, that I could only gratify his affection for me by rubbing his back with a stick, which seemed to afford him all the pleasure he desired. It is pleasant to meet such emigrants as these Germans, who bring with them the tastes of their father-land, and the means of further cultivating them. They bring cheerfulness and contentment with them, and impart to the pioneer population by which they are surrounded

that love for refined enjoyments in which it is so often deficient.

Fording the Guadalupe River, which is here about eighty feet wide and beautifully transparent, we came to a more open country, though with patches more closely wooded than any yet observed. The prospect on every side was broad; the land appeared rich, and presented the traces of long cultivation. Passed several fenced inclosures, the first we had seen since leaving San Antonio.

A species of grape (probably *Vitis æstivalis*) was abundant in the bottoms of the rivers; and at the crossing of the Guadalupe we found the vines in great profusion, climbing into the tops of lofty trees, and filled with fruit, of which some of our young men gathered great quantities, and which proved very acceptable.

Stopped at the house of Dr. Ernst Kapp, Professor, as indicated by his card. There was here the appearance of comfort and taste, though the house was of logs. I was introduced to his wife and daughter, who both appeared to be intelligent, and several bright-looking children. Waited here a couple of hours for a supply of corn, and then drove to a watering place seven miles further, where we encamped for the night.

October 14th. Soon after starting this morning, we ascended an elevated hill, the highest yet met with in the country. The road had followed up a rich and narrow valley, studded at intervals with oaks, and covered with luxuriant grass, when at length it wound around the base of the hill, and by a zig-zag course led to a point near its summit. Here I left the road and

walked to the hill-top on the right. It had a conical shape, with a level surface, scantily covered with low shrubbery, and was about half an acre in size. A magnificent prospect here opened to the sight, surpassing in extent any thing we had seen in Texas. To the south, the view extended at least forty miles, losing itself in the distant hills, which were scarcely distinguishable from the pale blue sky of the horizon. On the east and west were elevated points, inclosing the valley through which we had for miles been winding our way. The hills around us presented a singular appearance, owing to their terraced sides. These terraces are formed by layers or strata of limestone, which jut out from the sides of the hills, the rains having washed away the soil. This was characteristic, more or less, of all the hills then in sight, though we afterwards met more striking ones as we journeyed westward. This peculiarity of the hills, from the plateau of Texas to the Missouri, has been noticed by other travellers, and is represented in many of the scenes given by Mr. Catlin in his work on the Indians. On the north side, whither we were directing our march, lay a broad and deep valley, exhibiting, even from the distance, a fertility of soil such as we had not before seen. This valley, as far as I could judge, appeared to be about twenty miles in length; though I think it extended further, its termination being concealed from view by the projecting spurs of the mountains. The whole was clad in foliage of deep green, so that it appeared like a dense wood. As we approached, we found ourselves in an open forest of live-oaks, without any under-growth of shrubs. The grass was nearly

three feet high, and its strength showed the richness of the soil. After riding several miles through this beautiful valley, we forded the river Piedernales, there about one hundred feet in width, and entered the village which glories in the name of Zodiac, a Mormon colony of one hundred and fifty persons, under the especial care of Elder Wight, as designated by the faithful, though among worldly sinners he bore the appellation of "Colonel."

Sending the train forward by a more direct road, I drove, with twelve of my party, to the house of the Mormon leader. To a request that dinner might be served to us, if it was his custom to entertain travellers, he readily expressed assent, and ordered the meal to be prepared.

Every where around us in this Zodiacal settlement, we saw abundant signs of prosperity. Whatever may be their theological errors, in secular matters they present an example of industry and thrift which the people of the State might advantageously imitate. They have a tract of land, which they have improved for about three years, and which has yielded profitable crops. The well built houses, perfect fences, and tidy door-yards, gave the place a home-like air, such as we had not before seen in Texas. The dinner was a regular old-fashioned New England farmer's meal, comprising an abundance of every thing, served with faultless neatness. The entire charge here for a dinner for twelve persons, and corn for as many animals, was three dollars—a modest demand, which strikingly contrasted with the Astor House prices of a Mr. McGrew, and some others, between Indianola and Victoria.

The Colonel said he was the first settler in the valley of the Piedernales, and for many miles around. In his colony were people of all trades. He told me that his crop of corn this year would amount to seven thousand bushels, for which he expected to realize one dollar and twenty-five cents per bushel. Finding that I had not the means to transport the corn I should absolutely require for my journey, I struck a bargain with Colonel Wight for another team, consisting of a wagon and four mules, which he agreed to deliver to me at Fredericksburg.

Taking leave of our Mormon friends, we rode on two miles, to an encampment of Delaware Indians. Stopped to see a chief, whom I was advised to employ to accompany us to El Paso, where he had been with other parties, and who, from his acquaintance and influence with the Indian tribes on our route, might be of great service. Unfortunately he was absent, and not expected to return for a week. This people did not present a flattering appearance, and seemed to have few more comforts than the wild and unsubdued tribes we afterwards met. A mile further brought us to the United States military post, called Fort Martin Scott, under the command of Colonel Stannaford. This was the most extreme post on the frontier. We were kindly received by the officers here, and furnished by the acting commissary, Lieutenant Blake, with such provisions as we stood in need of. After an hour's delay, we rode on, about two miles further, to Fredricksburg, and pitched our tents on an open spot in the centre of the village.

This is a flourishing German settlement, founded

about three years before our visit, or in 1847, and has a population of about five hundred souls. There were but few Americans to be seen. The stores were filled with goods adapted to the Indian trade, as the place is on the very borders of civilization, and resorted to by numbers of the Indian tribes contiguous.

CHAPTER IV.

FREDERICKSBURG TO HORSE-HEAD CROSSING.

Projected route through the wilderness—Setting out—Uninviting appearance of the country—Precarious condition of German settlements on the Llano River—Leave the Emigrants' Road—Crossing of the San Saba—Community of prairie dogs—Kickapoo Creek—Hints to future travellers—The Mezquit—Visit of Lipan Chiefs—Indian dexterity in mule catching—Regain the Emigrant Road at Concho River—Horse wounded by a rattlesnake—Character of country and vegetation—Mustang roads—Scarcity of water—Prairie on fire—Deceptive maps—Castle Mountains—Stray cattle captured—Pecos River—Chapporal—"Indian sign."

September 15th. Remained at Fredericksburg to-day to procure our supply of corn, and made the acquaintance of many of the citizens, among them Captain J. L. Ankrim, since appointed Judge of El Paso district. I was exceedingly anxious that Judge Ankrim should accompany us to El Paso. He had been on the road several times, and directed its construction; moreover, his intimate acquaintance with the country and knowledge of the Indian character were such, that I believed he might be of essential service. But his engagements were of such a nature as not to permit his leaving at the time. I felt much disappointed, and a heavy responsibility resting on me, in having to conduct such a party across a country

but little known, a distance of more than six hundred miles. Not one of us had any experience in crossing the prairies beyond what had been gained in coming up from the coast. None had ever encountered any hostile Indians, or suffered the hardships which inevitably attend a journey in the wilderness like that before us. I endeavored to procure a guide in San Antonio, but was unsuccessful, and, in the last emergency, took a man who had driven a team some months previous in a train which came to this place from El Paso. Judge Ankrim gave me much information about the route we proposed taking, and advised me to leave the Emigrants' Road, which passes by the old fort on the San Saba, and take a more northerly course. He said there had been no rain for several months, so that the small streams might be dry, and the grass poor; and that to cross the tributaries of the Colorado nearer their union with that stream would insure a greater probability of finding water and grass. There was no road or trail along the route he recommended, until we should strike the Concho; but he marked the courses down on my travelling map, so that I anticipated no great difficulty in finding my way. We were to continue on the Emigrants' Road for several days, until we crossed the Llano River. About two and a half miles from this stream the Judge said we would see a mezquit tree close by the road, on the right, and a broken limb of another tree suspended from one of its branches. At this tree we must leave the road, which has a westerly direction, and strike off to the northwest; soon after which we would cross the San Saba River. Continuing this

course, we would then meet the south branch of Brady's Creek, and next the north branch of the same. The latter we must follow to its source, which lay in a westerly direction. Here we should find some small pools or springs. From this point we were to take a course due west, crossing many streams, which are laid down on the maps, until we discovered two conical hills or mounds. Between these we must pass, when we should see the Concho River about seven miles distant. Striking that at the nearest point, we would find the Emigrants' Road once more, which we had only to follow to its termination on the Rio Grande.

October 16th. As the corn contracted for was not delivered until late, the train did not get off before twelve o'clock. The first watering place was seven miles distant, beyond which I was advised not to go, as it was then late, and it was a good day's journey from that to Hickory Creek. The road was much better than it had been beyond Fredericksburg; the country was covered with grass, and wooded, as it had been since we passed the Guadalupe.

October 17th. Left at 7 o'clock, and a few hours after came to an old Indian encampment. The country now assumed a different aspect: ledges of granite and fragments of quartz appeared, and the entire surface was much broken; the oaks were fewer and of less size; mezquit trees were scattered among them, with here and there a cactus. It was, on the whole, the most interesting country we had seen since leaving San Antonio. A reddish sandstone appeared in some places, the debris of which imparted its own hue to the

soil. Weather oppressively hot, the thermometer at 90° Fahrenheit. Rode eighteen miles and encamped on Hickory Creek, a small stream at any time, but now dried up. On a closer search, a few water-pools were found, which were sufficient for our purpose.

As according to our maps there was a German settlement on the Llano about fifteen miles from our road, I determined to send a party there to purchase a load of corn for our animals. Mr. Thurber and three others constituted this party. It was small to enter an Indian country; but being without wagons or other property, save their animals, and moreover being well armed, there was no danger of an open attack by the Indians. A surprise was all they had to fear.

October 18th. Left camp at 6 o'clock; Mr. Thurber and his party at the same time striking off on a trail which ran in a northeasterly direction. Thermometer stood at 60° , with the wind northeast. The country assumed a more agreeable aspect than yesterday. Live-oaks prevailed, with a few mezquit; the former large and in thick groups. Passed several valleys more thickly wooded. Reached the Llano at 11 o'clock.

Found two deserted houses, with out-buildings and inclosures. Were informed at Fredericksburg that the Comanches had attacked this place about six months before, killed one man, and driven away the rest: it has not since been occupied. I could conceive no reason why a few settlers should come so far into the midst of an Indian country, when land equally good and cheap might have been had near a settlement. The situation, it is true, is a very fine one, on the banks of a clear and beautiful river, with water power in abun-

dance and timbered land. But all these, even if given to the occupant, are of little value when life and property are unsafe. A number of hogs were running about quite wild, of which a couple were killed, to add to our stock of fresh meat.

The Llano is the finest stream we have yet met in Texas, the Guadalupe alone excepted. Where we forded it, it was two feet deep and one hundred and fifty in width. At a short distance was a rapid, with fall enough for mills. On the opposite bank we found the traces of a large Indian encampment, which, from appearances, must have been occupied a long time: it was probably the habitation of those who destroyed the settlement referred to. Left for Mr. Thurber and his party a note affixed to a pole, stating that we had passed on. After getting our teams up the opposite bank, which was very steep and rocky, and attended with considerable difficulty, we continued our march nine miles over a fine country to Comanche Creek, a small stream then nearly dry. Where we encamped, there was no running water; the little that remained stood in pools among the rocks in the bed of the stream. It was, however, clear and very good. In one of these pools, not exceeding sixty feet in length and eighteen inches in depth, I saw a number of mullet from ten to fourteen inches long, and several gar-pike about two feet in length. There were no small fish in the pool, the gars having doubtless devoured them. Some of our men got into the water with bushes, drove the fish to one end of the pool, and caught some of the mullet, which proved to be good eating. The water line on the banks of this stream showed it to be some six feet below its ordinary height.

At sunset Mr. Thurber and his party rejoined us. He reported that he had visited the German settlements as instructed. The first one presented a scene of desolation seldom witnessed, owing to the predatory incursions of the Comanches, and was on the point of being abandoned. The other, called Zastel, contained twenty-six houses; though but nine families remained, and the wives and children of most of these had been sent away to New Braunfels and other places. These people, living as they do upon the very outposts, are so completely at the mercy of the Indians, that it is doubtful if they succeed in braving it out. Their houses are very small, built of squared logs, and furnished with loopholes for rifles. The land is poor; and there seemed no attraction about the place, except the beautiful Llano, which is a most picturesque stream, now rushing in rapids over a rocky bed, and now spreading into broad and quiet lakes.

On their way back the party met a band of Caddo Indians, a small but mischievous tribe, returning from a horse-stealing expedition. They spoke some English, and had a number of fine animals with them, which they said they had taken by way of reprisal from their enemies the Wacoos. But the knowing look which one of them put on when Mr. Thurber expressed a doubt of the story, and the fine condition of their horses showed pretty plainly that they had been among the settlements.

About midnight a party of Germans reached camp with about twenty bushels of corn, which proved a valuable accession to our stock, and made up what we had been feeding out.

October 19th. All up before day ; dispatched breakfast, struck tents, and were off at 6 o'clock. The morning was clear and cold, the mercury standing at 36° at sunrise. This low temperature affected us sensibly after the very hot weather we had had. The country was thinly wooded with live-oak. Passed a range of high hills, with two conical ones standing directly in our path, between which we passed. Left my mule and walked to the summit, whence there was presented a fine view of the surrounding country, consisting of an alternation of hills and prairie, with scattering trees, chiefly mezquit. Leaving this valley we ascended to a plateau, the surface of which was quite level. We now looked anxiously for the mark, where Judge Ankrim directed us to leave the Emigrants' Road, and soon discovered a broken limb suspended from a tree, precisely as described to us. Here, with some reluctance and not a little uneasiness, I left the beaten road and struck off into a broad and open prairie in a north-westerly direction, with no trail or path, and no guide but my compass. The man hired at San Antonio proving entirely ignorant of localities and destitute of useful information, I sent him to the rear of the train, preferring my maps and compass to his doubtful suggestions. Had the country presented a pleasant aspect, we would have entered the untrodden field with more satisfaction ; but, unfortunately, a recent fire had burned off all the grass, destroying every green thing and leaving only a black stubble, from which slabs of limestone protruded. The soil appeared good.

We had hoped to meet the San Saba River soon after leaving the road ; but coming to a small stream

at 4 o'clock, with water standing in pools, and a little patch of grass near, which had escaped the fire, I deemed it prudent to go no farther, but encamp, rather than continue our march without knowing the exact distance to the river. It is always advisable to encamp early enough to procure wood and water, and make all the necessary arrangements before dark. We generally endeavored to get into camp in season to let our mules graze two or three hours before nightfall; but in some instances this was impossible, as our daily marches were governed by the state of the grass and facilities for procuring water. If we struck a spot with these important necessities by two or three o'clock in the afternoon, we encamped. In some instances we even stopped at twelve o'clock, while in others we kept on our way until dark.

October 20th, Sunday. I would gladly have remained in camp to-day, agreeably to my original intention to rest on Sundays; but it was of the utmost importance that we should push on as fast as possible, having barely provisions enough for our journey. Besides, there was scarcely grass enough for another day's feed on the little spot where we were encamped. Early in the morning, therefore, I sent off parties to seek the San Saba River, and a place to cross it. We were occupied an hour or two in securing some mules which had got loose during the night; but by the time the animals were hitched up, reports came in that the river was within a mile of us, and a fording place had been found. We soon after got off, and, crossing some steep and rocky hills, reached the ford. The horsemen led the way across the stream, which was

very clear, and flowed over a smooth limestone rock. But the opposite bank was found to be impassable for wagons. Set all hands at work, some in levelling the bank, some in bringing logs, boughs, and stones, while a passage through the thick wood which grew along the river's margin was opened with axes by others. In an hour all was ready. The teams were now brought over singly, and by hard pushing and pulling they were all got safely up the bank.

Near this crossing, we observed fine burr oaks; and the ground was strewn with their enormous acorns, with beautifully fringed cups. A gradual ascent over a rocky surface brought us again to the level of the table land beyond. We continued our way over gentle hills, pretty well covered with mezquit and live-oaks, for about six miles, when we reached Camp Creek, a small stream, dry in many places. Stopped an hour to water our animals and take lunch, as it was my determination to reach Brady's Creek, about sixteen miles distant.

The ground ascended gradually from this point for several miles, when we struck a more open country, on a level plateau, which continued without interruption during several hours' march. On this plateau we entered a colony of the misnamed "prairie dogs," which extended in every direction as far as the eye could reach. The ground occupied by this fraternity was distinctly marked by the shortness of the grass, which these little creatures feed on, as well as by their hillocks, some of which contain two or three cart-loads of earth, brought up by them from their excavated dwellings. We tried in vain to get one of them as a specimen,

dead or alive. At least twenty shots were fired at them, both with pistols and rifles, by several individuals of the party, who considered themselves good marksmen; but they either dodged at the flash, or, if shot, fell into their holes, at the mouth of which they invariably sat. Not one was obtained. On examination, drops of blood were seen near the holes, which showed that some of the shots took effect. In one instance I saw a rattlesnake enter one of the habitations; but whether he belonged there or was an interloper it was impossible to tell. Small brown owls flitted about, and lit on the little hillocks in the midst of the prairie dogs, with which they seemed to be upon good terms. For more than three hours our march continued through the vast domains of this community, or "dog-town," as they are usually called, nor did they terminate when we stopped for the night.

The country passed over to-day was very smooth and hard, and excellent for wagons in any direction. The grass was poor. The only trees seen were mezquit, which we here found for the first time in fruit.

The plain suddenly terminated by a steep descent of about 150 feet, to another, which extended along its base, and through which ran Brady's Creek (south fork), where we encamped. Like the other water courses we had passed, this was nearly dry, and existed only in pools. Quails were abundant here; and by the time my cook had his fire ready, I had a dozen of these delicious birds ready for him. Estimated distance travelled to-day, twenty-five miles.

PEAIRIE-DOG TOWN.—p. 79. vol. 1.

October 21st. The night had been quite cold. The morning was clear and pleasant. Left at half-past six o'clock. The colony of prairie dogs continued the whole of this day's march, with scarcely an interruption. Our course was more westerly, over a level and open country, covered with short mezquit grass, and studded with small mezquit trees, uninterrupted by either hill, rock, or valley. We kept steadily on by the compass until we struck the north fork of Brady's Creek, sixteen miles from our last camp. Stopped on its banks two hours to water and graze the animals, a longer time than was necessary, or than could well be spared; but our mules got frisky, and it was difficult to catch them. I determined not to make a noon halt again, but to push on until we should reach our place for encamping. This course is recommended by all experienced men who have had charge of trains. A stop cannot be made at noon, if the mules are taken from the wagons, without consuming two hours, which cannot be spared, unless a very long march is to be made, and continued during a portion of the night. Then it becomes necessary to stop to rest and feed. Reached what I supposed to be the head of the creek at half-past three o'clock; at least my guide stated such to be the case, and that we should not meet water again for thirteen miles. We therefore encamped here, though the grass was very poor, having been recently burnt, and the new shoots but just appearing above the ground.

October 22d. Delayed this morning until half-past eight o'clock in searching for four mules, which got loose during the night and disappeared. Such is

often the case when the grazing is poor; and parties should take particular care on these occasions to see that their animals are well secured. Left three or four men to continue the search after the mules, as we had no animals to spare. Found Brady's Creek did not terminate here, as my guide stated, but led towards the south-west. Followed it three or four miles, then crossed it, and took a course a little north of west, and reached a pool of deep water, with excellent grass on its margin, about four o'clock. Believing this to be the head waters of the creek we had been following, and having travelled nine hours pretty steadily, determined to stop here for the night. The country passed over to-day has been very flat, and of the same character as that the two days previous. As we are now on the high table-land, the trees diminish in number and in size. A few mezquit trees, stunted, deformed, and decayed, appear on the prairie, and occasionally a "*mot*" of live-oaks. The community and domain of the prairie dogs, which we entered two days ago, continues.

The men we left to search for the missing mules rejoined us, and, greatly to my disappointment, without the animals. They had scoured the country for miles around; and having seen "Indian sign," as it is termed, about a mile from our trail, keeping by us for many miles, they believed our mules had been stolen, and that a band of Indians were following us. It is not necessary that the savage should be seen, to judge of his presence. He always leaves marks behind him, which are soon understood by the sagacious travellers of the prairie, and are as unmistakable as his own red skin.

October 23d. Got off at six o'clock, an early hour for the season; but it is an advantage for travellers in this region to push on as far as possible in the early part of the day. Even now the heat of the sun at mid-day was great, and the shade of a tree refreshing. To move at six, it was necessary to call the cooks at three o'clock, and to take breakfast before day. After this the cooks and servants had to take their meal, the cooking utensils were to be washed and stowed away, the tents struck, and every thing put in its proper place in the wagons.

Two miles brought us to Kickapoo Creek, and three miles more to a small pool, with a river running through it, marked on the map as "Potato Spring," where we stopped to water our animals. Continued our route towards an opening or pass in the elevated ridge, which stretched across our path, in a direction from north to south, called "the divide." Noticed a sudden shelving off on the north side of the highest portion of the ridge, directly in our front, where we supposed the pass to be. As we approached we could discover no opening; and the point towards which we had been moving was so rocky as to seem utterly impracticable. To the northward the ridge appeared less abrupt and rocky, which induced me to deviate from the prescribed course. The ascent was gradual, but quite rocky. For six miles or more we held our way over the dividing ridge, which proved very tiresome to our animals. The hills were entirely destitute of trees and shrubs; and as the grass had been recently burned off, the prospect before us as far as we could see was extremely barren. North of us, at

a distance of two or three miles, the ridge we were crossing terminated, and beyond it lay a broad and open prairie, extending to the river Concho, the course of which could be distinctly traced by a long line of dark foliage meandering through the plain.

I would recommend future travellers who may follow my trail, or any other road passing this way, to leave the stony ridge we had been crossing to the south, and keep on the plain, where the soil is hard and smooth. The distance might be increased a couple of miles, but it could be accomplished in less time, and with less fatigue to the mules, than the toilsome passage of six miles, over steep and rocky hills, endangering the wagons, and injuring the hoofs of the animals.

Descending the range of hills, we passed the dry bed of a water-course, and reached a stream called Antelope Creek, one of the tributaries of the Concho River, at five o'clock, where we encamped.

Our route to-day had been over a level prairie country, deficient in wood, save a few scattering mezquit trees of diminutive size, and light grass, indicating a poorer soil. We have noticed as we advanced westward, and ascended the high table-land of Texas, an inferior soil, and, as a necessary consequence, a more scanty herbage. The beautiful live-oak, which abounds in eastern Texas, and which grows luxuriantly in the valleys as far as the north fork of Brady's Creek, had now disappeared, save on the immediate banks of water-courses. The mezquit, too, which grew large and thrifty on good soil, had now either disappeared or dwindled into a diminutive tree or mere shrub.

The mezquit (*Algarobia glandulosa*) is an important tree in this region, and is mentioned by various travellers as mezkeet, musquit, muckeet, &c.; it belongs to the same natural family as our locust, which it very much resembles in appearance. The foliage is more delicate than that of the locust. The wood is hard, fine-grained, and susceptible of a high polish; and were it not difficult to obtain it sufficiently large and straight, it would be much sought after for cabinet-making purposes. The tree seems to suffer from the attacks of insects in a similar manner with the locust. The mezquit bears a long and narrow pod, which, when ripe, is filled with a highly saccharine pulp. Horses and mules are exceedingly fond of these, and will often leave their corn for a feed of the mezquit beans. Its great value is for fuel, for which purpose it is not surpassed by any of our northern woods. Where the prairies are frequently burned over, the tree is reduced to a shrubby state, a great number of small branches proceeding from one root, which goes on developing and attains a great size, though the portion above ground may not be more than four or five feet high. These roots, dug up and dried, are highly prized for fire-wood, and form, when thoroughly ignited, a bed of lasting coals, much like those from the hickory of the North.

The water of Antelope Creek is clear and sweet. Large oaks and pecans grow upon its banks, from the latter of which we gathered a quantity of its excellent nuts. To the north, saw ranges of mountains far beyond the Concho, a broad plain intervening. To the south were hills within a few miles, quite barren in

appearance. Passed several communities of prairie dogs, with the same interlopers before noticed, the rattlesnake and owl. I also observed rabbits among them, which took refuge in their underground dwellings. Flocks of plover were seen to-day on the barren hills. The jackass-rabbit also crossed our path occasionally; but it sprang up so suddenly, and darted through the low chapporal or bushes so rapidly, that I could not get a shot at one. Some catfish and trout were taken in the stream within a few rods of our camp. The men who were out with the mules reported that they had seen fresh Indian signs near us, which caused us to keep a diligent look-out.

October 24th. Just as we were leaving camp this morning, in fact after I had myself started, and was looking for a place to ford the stream, an Indian mounted on a mule suddenly appeared from behind a clump of bushes, and the next moment was in the midst of the camp. He advanced to the nearest party with his hand extended, and was received in a friendly manner. As soon as salutations had been exchanged, he hastily drew from his pouch a packet, and, after undoing sundry wrappings of buckskin and paper, drew forth several documents, which proved to be from various American officials. The first was from Judge Rollins, Indian Agent; the others from our military officers, certifying that the bearer was a Lipan chief of eminence, named Chi-po-ta, with whom a treaty of peace and friendship had recently been made, and asking the protection and kind treatment of all Americans who should pass through his country.

This chief was about sixty years of age, rather

corpulent, owing to the life of ease which he gave us to understand he had been leading, and was mounted on a mule so disproportionately small, as to present a most ludicrous appearance. He had a pleasant, benevolent countenance, and bore so striking a resemblance to the portraits of General Cass, that every one noticed it. He was well dressed in a suit of deerskin, with his bow and arrows slung across his back: these were inclosed in a beautiful case made of the skin of the American leopard, and he wore a pouch of the same material by his side.

He spoke Spanish tolerably well, Mr. Cremony acting as the interpreter, and was immediately brought to me. He said that he had discovered our trail two days before, and had since watched us, keeping at a short distance. That his people were encamped a few miles off, having removed the day before. Chipota knew enough of civilization to be aware that when distinguished gentlemen meet, it was customary to take a drink; and finding no proffer of such civilities on my part, he gave me to understand that he would not object to a glass of whiskey. I told him that we were Americans who always drank water, and consequently were not provided with whiskey, an assertion that he seemed to doubt. I added, however, that if he would accompany us to our next encampment, I would give him a shirt and something to eat. As we intended to encamp after a short march, in order to give our animals an opportunity to graze, I asked him to take a seat in my carriage, an invitation which he accepted with a delight that showed itself in spite of his endeavors to maintain his gravity. Contrary to the

custom of his race, he manifested much curiosity respecting all he saw; for the carriage was well filled with a variety of knick-knacks which were new to him. The revolvers and other fire-arms interested him exceedingly. My Sharp's rifle which loaded at the breech and primed itself, surpassed all his previous conceptions; and after that, he was prepared for any thing in the shooting line. Taking up my spy-glass, which he supposed to be some other contrivance of the sort, he wished to be shown how it was fired off. The instrument was adjusted, and a distant tree pointed out, which he was told to look at with the glass. His credulity had been overtaken, and it was hard to convince him that it was the same far-off tree. I told him that we used that to see the Indians at a distance, and could always tell when they were about, or had stolen any mules. In mien and conduct the old chief was extremely dignified and self-possessed, although his Indian gravity was not proof against the jovial conduct and expressions of our little company, all of whom took an interest in this first specimen of the wild denizens of the prairie that we had met with. Many a blithe smile wreathed around his lips; and now and then a hearty laugh would ring out from the depths of the old man's heart, with a right good will. Finding that he had mules, I requested him to bring them to our camp, and also to let us see his people.

Five miles over a flat country brought us to the South Fork or Boiling Concho. The stream is deep, clear, and in many places rapid. Crossed it, after some little search, over a ledge of rocks, and stopped to water our animals. The flat country continued, with a few

mezquit and an occasional live-oak. The grass good. Passed Dove Creek, a small stream filled with rushes; and a ride of four miles further over a similar country to that before described, brought us to Good Spring Creek, a stream of clear cold water. It was yet but one o'clock; but as the grass was unusually fine, with wood and water in abundance, I determined to rest the remainder of the day.

Our course to-day had been due west towards the Green Mounds, the land-marks alluded to by Judge Ankrim, the sight of which we all hailed with pleasure, as they satisfied us that we were in the right track. To the north we had seen the twin mountains, standing far and alone in the prairie, which are laid down on the map. The stream looked so inviting, that the fishing tackle was got out, and some twenty-five black bass and catfish taken. These were divided among the messes, and made an acceptable meal. A few ducks and quails were also shot here.

An hour or two after we encamped, Chipota returned with Chiquita, another chief, and several others of his band. This was a man of some consequence too, as he gave us to understand; and such was proved to be the fact by the certificates he presented "defining his position," which requested kind treatment from all Americans. He was about the age of Chipota, and similarly dressed. With them were three others, one a remarkably fine-looking young man, of athletic form, which he took pride in displaying. He wore no garment but a breech-cloth and a necklace of bone, and was decorated with a few patches of vermilion. At first he strutted around the camp, with an evident design

of making a sensation, and to convince us that he felt it a condescension to associate with us; but he afterwards became quite familiar, particularly with those who could hold a conversation with him in Spanish, which he understood well, and spoke a little. He asked one of our young men if he was married. The latter, as such happened not to be the case, was somewhat confused, not liking to acknowledge the fact, as he feared it would lower him in the estimation of his savage friend, who moreover might take it into his head to offer him one of his red-skinned sisters for a spouse, to refuse which would give mortal offence. Without replying, therefore, he exhibited a miniature of a beautiful woman, which he carried around his neck, and which quite enchanted the red-skin. He expressed great admiration at the picture, and never seemed tired of gazing at its mild countenance, with its bright eyes smiling upon him. The next morning before leaving, this young Indian made his appearance at the tent of the owner of the miniature, and endeavored to purchase it, offering in exchange his bow, arrows, tiger skin, and finally his horse. Failing to acquire it, the young man begged one more sight of the enchanting image, which he was permitted to enjoy; he gave it one long and affectionate look, leaped upon his horse, and rode off.

Chipota brought with him one mule, which I bought, and would gladly have taken more; but whether these people had them or not, no more could be obtained. I also offered them ten dollars each, or goods to that amount, if they would bring in the few mules we had lost; but they adhered to their first assertion, that they

had not seen them. As they showed no inclination to leave, we were obliged to give them a supper, after which they asked permission to remain all night with us. This I felt reluctant to grant, not knowing but some treachery or trick might be meditated, such as running off our animals during the night. On further reflection, however, I consented, on condition that they remained by the fires without the encampment—at the same time warning them, not to come near us in the dark, lest our guard should take them for Comanches and shoot them. They obeyed my injunctions, and remained quietly by the fires. The night was rather cool, and day had scarcely dawned, when I was aroused by a tap at the window of my carriage, in which I slept. Rising up, I found old Chipota there shivering with cold. On opening the door, he whispered, “Mucho frio—poco de viskey:” Very cold—a little whiskey. I was compelled again to deny the old man, but compromised the matter soon after by giving him a bowl of hot coffee.

The Lipans are a large and warlike tribe, extending from Zacatecas, in Mexico, to the Colorado of Texas. In fact, they rove from the sea-coast to the borders of New Mexico, and have as wide a range as the Comanches. During the winter, they remain in the Bolson de Mapimi, a vast region lying west of the Rio Grande, which has few inhabitants, except the untamed Comanches and Lipans. The portion of the tribe in Texas are at present on friendly terms with the whites, but are sworn foes of the Comanches, whom they profess to hold in great contempt. The Lipans, in common with the Indian tribes of Mexico, and of the States

formerly belonging thereto, speak Spanish, some of them with tolerable fluency.

October 25th. One of our mules got loose this morning; and after an hour and a half spent in trying to catch him, the teamsters gave up the chase. I then offered the young Indian a red shirt, if he would perform the job. He leaped on his horse without a saddle, took a long lasso or rope in his hand, and dashed off at full speed, followed by several of our men, after the mule, who, seeing his tormentors approach, took alarm and ran with his utmost speed. The race was quite exciting, and for a little while, it seemed doubtful which side would win. At length the Indian got within about forty feet, when, with a vigorous effort he threw the lasso over the mule's head, and at once brought him to a stand. All seemed to enjoy the sport much; and the Indians, who had each received from us presents of shirts and trinkets, parted from us, apparently delighted with their visit.

The creek was five or six feet deep near our camp, but after a little search we found a bare rock near a fall, where we made an easy passage across. An hour after leaving, reached a branch of the stream we had left, which we followed in a course to the west-southwest for five or six miles, before a fording place could be found. The water was deep, and the banks abrupt. Crossing this stream, we again pursued a due west course until we struck Lipan Camp Creek, which, as well as all the other streams we have crossed since leaving Brady's Creek, are tributaries of the Concho. We now made directly for the Green Mounds, which appeared but a few miles from us up a gradual ascent.

They lay north-east and south-west from each other, and the train passed directly between them. While the train moved along I ascended the easterly mound, accompanied by several others, to see what was the character of the country before us. These mounds or hills are about five hundred feet high, and had been but recently burnt over; hence their color was far from being green. Not a blade of grass was to be seen. A few half-burnt bushes and tufts of the yucca were all the vegetation that remained. From the summit we saw the line of the Concho River running in a northeasterly direction, some six or seven miles distant. Reached it at five o'clock, when, to our great joy, we again struck the Emigrant Road, which we had last seen south of the San Saba. Very few trains had passed over it, so that it was not more distinct than the roads or paths through a northern meadow.

We had now been travelling eight days over a district one hundred and fifty miles in extent, with no other guide than a compass. From the point where we left Brady's Creek, we had pursued a course as directly west as the nature of the country would admit, with no land-mark but the Green Mounds, which we had seen about forty miles before reaching them. In this march we had frequently crossed a single wagon trail, which we took to be that of Major Bryan, of the United States Topographical Engineers, who, in June and July of the previous year, had passed this way.*

The character of the country the last three or four

* Since my return from the survey, I have seen the printed Report of the Reconnoissance made by Major Bryan, which convinces me that our routes were nearly the same.

days has varied but little. The soil is poor and the grass scanty, except near the water-courses, with but few trees. For a wagon road it is admirably adapted, and scarcely requires a spade, except at the river crossings, which might be improved by a little levelling. No animals, except wolves, antelopes, and rabbits, have been seen. Along the banks of the streams are pecan trees, from which we supplied ourselves with this delicious nut.

An incident occurred to-day which deserves notice. Soon after leaving the Green Mounds a rattlesnake was seen in the path, and was passed over by my carriage. Mr. Cremony, who was riding immediately behind, discharged his pistol at it; and at the same moment the snake darted at the hind leg of his horse. He dismounted, and on examination discovered by a drop of blood the spot where the reptile had inserted his poisonous fangs. In less than half an hour after the horse began to limp and show the effects of his wound; and his lameness increased until we reached our camp an hour later, by which time the leg had greatly swollen as far as the thigh. Dr. Webb now got out his medicine chest, shaved the hair from the wound, and applied some remedy. He also scarified the place and used the air-pump, but nothing seemed to check the swelling. The horse was now unable to stand, and thus he was left till morning.

October 26th. From our camp the Concho runs east for a mile, then north-east for about twenty miles, and afterwards in an easterly course again for about one hundred and twenty miles, when it empties into the Colorado. Near our camp, and for some distance on

either side, the stream flowed between banks about fifteen feet high, and was very muddy and shallow. A variety of trees with thick brush grew upon its immediate banks. There was no valley or bottom land, and the country for miles adjacent was quite barren, though it is said that catfish abound here; but our attempts to capture some were unsuccessful.

Left camp at sunrise and forded the river a few miles above. Crossed a branch at the south, and another on the north side of the stream, both quite small. Passed some deep *arroyos*, or dry beds of streams. Sent scouts ahead to look for the last water, where I intended to encamp and give my animals rest before attempting the desert that lay beyond. The stream continued to grow less as we advanced, finally losing itself in marshes or settling into mere pools. It also became so salt as to be undrinkable. The scouts on their return reported that the water grew saltier ahead, and that the banks of the pools were covered with incrustations of salt. With such a prospect before us, I thought the more prudent course would be to retrace our steps a mile, to a pool where the water, though far from being good, was palatable, and where there was excellent grass. At half-past two got into camp.

During the whole day we had seen great quantities of wild ducks, of which twenty-five were shot, also two large brandt. The whole party feasted on game to-day, which we relished much, having tasted no fresh meat since leaving Fredericksburg. I procured a supply there, which I hoped would last four or five days; but the great heat had rendered it unfit for use after the first day.

The river or rather creek followed to-day, ran through a valley quite barren, save on its immediate banks, where the grass was good. No trees were seen, except here and there a small clump near the water-pools. During the whole day's march ranges of barren hills lined the valley, which sloped gradually to its bottom. Estimated distance travelled to-day by the map, twenty-five miles.

Our wounded horse seemed somewhat improved this morning, though his leg was still much swollen. He was led, and, as our movement was slow, kept up with us without difficulty. On reaching camp, he did not appear the worse for his march.

October 27th. Continued along the valley of the Concho for eight or ten miles, and encamped at noon near a pool of brackish water, which our scouts reported to be the last they could find; and every appearance indicated a cessation of this necessary supply. To the west the valley seemed to terminate with the adjacent hills, and the open desert or prairie to commence immediately beyond. Expecting therefore no water until we should reach the Pecos, sixty-five miles distant, and knowing that the jornada which we had to cross furnished little grass, I determined to remain here the rest of the day, as the grass was very good and abundant. Our water-kegs were accordingly filled, as well as all the canteens, jars, bottles, and flasks that we could muster. Food was cooked; and it was determined that there should be no stop beyond an hour or two, to let the animals rest and graze, in case grass should be found. The wagons were reloaded, so that each should carry an equal weight. Many ducks were killed

in the water-pools. The road from our last camp has been good.

October 28th. The camp was aroused early; and after taking a cup of coffee, we resumed our journey, about an hour and a half before sunrise. Sent four men ahead to find the road. The hills extended some eight or ten miles towards the desert, when they gradually fell off into the plain. The desert was not, as I supposed, a level surface, but a succession of slight elevations. Every thing bore the appearance of extreme barrenness; not a tree could be seen. Mezquit chapporal, or bushes from three to five feet in height, were thinly scattered over the plain. The wild sage and *Larrea Mexicana*, the prickly pear and other kinds of cacti, constituted the vegetation of this desert region. Grama grass (*Chronodosium*) grew in some spots, and, though completely dried up, was eaten with avidity by our animals. Antelope were seen in great numbers, but so shy, that in the open plain we could not get a shot at them. Colonies of prairie dogs were occasionally observed; and from the numerous burrowing places of greater or less size, it was evident that other animals found a dwelling among them. A few rabbits were also seen bounding over the plain, and disappearing in their holes or among the bushes. Several shots were fired at them without success. These barren regions do not furnish many of the feathered tribe: a couple of prairie fowls, a flock of large curlews, and a few meadow larks and sparrows, were all that were seen.

About twenty miles from our last camp we passed a mud-hole, marked on the map as the "Mustang

Ponds." It was a slight depression in the prairie. Not a particle of water was to be found, nor did there appear to have been any for a long time. The earth was much trampled by deer and mustangs, which had doubtless resorted here in numbers for water. Made our breakfast from bits of cold meat and bread which we had taken with us, and did not stop the train until three o'clock, P. M. Finding a spot where there was plenty of dry grass, the train was stopped and the animals turned out to graze. The poor creatures seemed much fatigued, having been in harness ten hours without water or food. They ate the withered grass and browsed on the twigs of the mezquit bushes with eagerness. Gave each animal one gallon of water. They could not have suffered much for want of this, as the weather had been quite cool during the day. Built fires with the dry bushes, and made coffee. No meat was cooked. Our cold pork, and some of the ducks that remained from yesterday, with hard bread, gave us a luxurious dinner. At least so it seemed to us; for on no day since we commenced our journey had we relished a meal more. The cool and bracing air of the prairie had given all good appetites.

Had a narrow escape from one of those accidents which, in spite of every precaution, will sometimes occur. One of the cooks, contrary to my express orders, built his fire near the dry grass without digging a hole. The grass took fire, spreading on all sides, and advanced with fearful rapidity towards the wagons, in the direction of which the wind was blowing. All hands ran to the rescue with blankets and cloths to beat down the fire; and those who could

not in the hurry of the moment get any thing else, took their coats and hats to battle with the raging element. Some ran to the wagons to remove them; but before they could be got out of the way, the flames were about the heels of the men and the wagon wheels. The slightly-marked road where the grass was destroyed, offered a temporary check, and was of great help to us in bringing the fire under. Had it had one minute more the start, a hundred men could not have controlled it; besides, had it extended fifty feet further—which it would have done in half a minute—it would have reached our animals, and caused a general stampede among them, resulting, doubtless, in the loss of many. We should then have been in a sad plight, thirty miles from water, and two hundred and fifty from the nearest settlement.

Such accidents have occurred, which have resulted in the destruction of trains. During the late war with Mexico, several wagons were burned by the grass taking fire.

The place marked "Flat-rock Ponds," where we were told water was sometimes found, was quite dry, nor were there any indications that there had been any there for months.

October 29th. We had kept in motion the whole of the preceding night. A cold wind blew most of the time, making it very uncomfortable. It is not a desirable piece of exercise at any time to ride on horseback all night; but when a person has been in the saddle for thirteen hours the previous day, and continues the journey without rest, it becomes decidedly disagreeable; and when morning dawned upon

us, all were pretty well used up. Nor could we now stop to rest. There was yet a long stretch before us to water, which must be reached at the earliest moment. During the night we passed the spot marked on the map as the "Wild China Ponds," which, like the places before referred to, was destitute of water. Great mischief is caused by marking such places on the maps; and had we not been told that it was doubtful whether water would be found there, we might have been unprepared with a supply, and have suffered accordingly.* From the spongy appearance of the ground near the water-holes, there is no doubt water might be procured by sinking wells, which ought to be done if this road is to be traversed.

Soon after daylight we halted the train, let the mules graze for an hour on the parched grass, made coffee, and such a breakfast as cold pork and hard bread would furnish. It was quickly dispatched, and

* On my return from California in 1852, I met several parties of emigrants from Arkansas and Eastern Texas, who had followed our trail from Fredericksburg to El Paso, and who were loud in their denunciations of those who had advised them to take this road, and more so of those who furnished them maps, which deceived them as to the watering-places. They expected to find water at the localities designated on the maps, and took no precautions in case of meeting with none. On reaching the so-called "Mustang Ponds," they did not recognise them, and sought for them in vain for miles around. At the "Flat Rock" and "Wild China Ponds," they were equally disappointed. They looked about the desert without success. One party was seventy-two hours without tasting water, and came near perishing. Many of their mules and cattle died; and such as had strength remaining hastened on to the Pecos. There had been no water at either of the places designated during the spring or summer, nor was there any in October or November, when we crossed it.

the few minutes we had to spare before the wagons were ready to move were seized to have a little rest. Brief as it was, it was a great relief.

Castle Mountain Pass, Texas.

Saw a low line of hills far off on our left, and immediately in front a range, called the "Castle Mountains," of considerable elevation. The road led to a gorge through which it was necessary to pass. These mountains derive their name from the projecting cliffs of limestone, which sometimes assume the appearance of castles. The pass was exceedingly steep, and the road tortuous, frequently running

between rocky walls, so close together as to render it impassable for two wagons abreast. These walls were covered with immense cacti wherever the almost perpendicular surface would afford them a foothold. As we entered the pass, we found among the debris of the limestone rock numerous fossil shells. It became necessary here to lock the wagon wheels and advance with great care. We had not proceeded far, when, at an abrupt turn, one of the wagon tongues snapped off. Two hours were lost in repairing this injury, which was effected by lashing two tent-poles to the broken tongue. I took advantage of the delay, and strolled about on the summit of the mountain. Portions of this pass are so narrow, that a few Indians well armed could keep off a large body of men. In exploring some of the recesses of this wild and romantic spot I noticed many caverns, which, from the quantity of bones within, were evidently the habitations or resort of wild beasts.

On emerging from these mountains, on the western side, several moving objects were discovered. They were at first supposed to be Indians; but on applying my telescope, they were discovered to be cattle. Several of the men set off in pursuit, and, soon coming up with them, drove them to our train. They proved to be quite fat, and had evidently strayed from some herd or train which had preceded us.

The road here was so excessively sandy, that our nearly exhausted animals could scarcely draw the wagons through it. The sun beat down with fiery force upon us, and we had not a drop of water to relieve our thirst, or that of the poor beasts, who

began to manifest their sufferings in the most piteous cries.

A march of twelve miles brought us to the river Pecos, on the banks of which, near the Horse-head Crossing, we encamped.

This river, which is the largest tributary of the Rio Grande, is here about 100 feet in width, and in the deepest part has four feet of water. Unlike all the other streams we had passed, the Pecos has not a single tree or shrub along its banks to mark its course, nor has it any valley or bottom land near. It runs with a dark rapid current between high perpendicular banks, cut through various strata of clay and sand. On both sides is a vast open prairie, entirely destitute of trees, though scantily covered with mezquit chapporal, and other plants of the desert. The soil is clay and sand, but so blended with saline matter that there is no vegetation save the plants mentioned. A few rushes grow on the margin of the river; but these scarcely appear above its banks, which are here from six to ten feet above the water. It is charged with an earthy substance, of a reddish or brown hue, which imparts its tinge to the water. As we approached, we looked in vain for the usual indications of a stream; for, owing to the want of trees or bushes, it was not seen until we were within a few yards of it. The Pecos resembles a great canal rather than a river.

During the latter portion of our route we first came into the proper chapporal, and met the plants peculiar to the flora of Mexico in such quantities as to give a character to the landscape. The term "chapporal,"

probably meaning a plantation of live-oak, is applied to the growth of shrubbery which forms a striking feature of the country. We have no similar growth at the North to which it can be compared. One may travel for days without seeing a tree higher than one's head; yet the whole country is covered with a thicket so dense as to be almost impassable to man or beast. The shrubs composing these thickets are, for the greater part, excessively thorny. The principal are shrubby mezquit; rosin wood, or creosote plant, a most disgusting, strong-smelling shrub; koeblerinia, called "junco" by the Mexicans, a plant armed at all points, every branchlet or twig being sharpened down to a spear; and various species of yucca. These last, particularly the kind known as Spanish bayonet, are truly formidable, their stiff sharp-pointed leaves being capable of inflicting a dangerous wound. The thorny shrubs enumerated, with various species of prickly pear and other cacti, make up an alliance which one soon learns to treat with proper respect.

We had no sooner got into camp than one of the fattest oxen we had just secured was killed; and such a treat of fresh meat as we had, cannot be appreciated but by those who have lived on salt pork for nearly three weeks. We made great calculations on having fresh beef the remainder of our journey, by driving the other two oxen with us; but during the night they escaped. We made a diligent search for them the following day, but they could not be found.

I have omitted to notice an incident that occurred soon after emerging from the pass in Castle Mountain. Anxious to find the Pecos, I sent off men to search for

it. They returned much alarmed, declaring that they had seen "Indian sign," and pointed out to me in the midst of the vast plain that lay before us the well-known Indian signal of a puff of smoke suddenly rising from the earth. This is produced by making a fire in a hole, and then smothering it with leaves. The hole is suddenly opened, when the smoke rushes forth in a dense body, and rises high in the air in a perpendicular column. Such columns are often seen in traversing the deserts and plains, and cannot be mistaken. Not knowing but Indians were near, our arms were got ready, and every bush and rock we passed was carefully scrutinized. No Indians, however, were seen by us; although at the crossing and near our camp there were fresh tracks of a large number of mules and horses, with a few moccasin prints, which convinced us that a party of Indians had crossed within twenty-four hours of us.

CHAPTER V.

HORSE-HEAD CROSSING TO DELAWARE CREEK.

Crossing of the Pecos—Narrow escape from a cold bath—Desolate region—Prize oxen—Stray mule—Populous biscuit—Toyah Creek—Travellers' tokens—Rescue of lost mule—Dreariness and monotony of the Pecos—A horse's somerset—Delaware Creek—Snow-storm, sport, and Erman's Siberia—Mr. Thurber and others despatched to El Paso—Letter to Major Van Horne.

October 30th. After our fatiguing march of two days and one night without rest, we slept pretty late this morning; even the expectation of a fine beefsteak for breakfast could hardly induce either officers or men to turn out. After breakfast, I examined the river with a view of crossing, intending to devote the day to it, and recruit our tired animals. Found the water at the Horse-head Crossing, which was a quarter of a mile from our encampment, to afford the greatest facilities. Here there was a bank about half the height of the main bank, to which there was an easy descent, and one equally so to the water. It is the place where other parties seem to have crossed, and hence rendered easy of access. I noticed a long line of horse or mule skulls placed along the bank, which probably gave it the name it bears.

On sounding the river to ascertain its depth, we found that our ambulances (i. e. wagons mounted on springs) would pass over without wetting their contents. We therefore unloaded all the wagons but those on springs; and placing their contents in the latter, we succeeded in passing all our provisions, baggage, etc., over with but little trouble. The west bank was levelled with our spades, to make the ascent from the water easy. I remained with Dr. Webb and Mr. Thurber until all were over, except one empty wagon. This being quite low, its box would be partly immersed in the water; an ambulance was accordingly sent back for us, and for the contents of my carriage. We entered the stream, which just touched the bottom of the ambulance, but not without some fears, as experience had shown that the best and most gentle mules cannot always be depended upon. When we had reached about two thirds the distance across, or some thirty feet from the opposite bank, the mules either lost their footing, or were swept by the current into deeper water, a little out of the course taken by those which passed over before. Unable to contend against the force of the water, which was almost on a level with their backs, the leaders turned their heads down stream. The teamster, who was mounted as usual on one of the mules next to the wagon, endeavored in vain to bring them to their places with their heads towards the shore. The frightened creatures could not maintain their footing; and in struggling to extricate themselves, they extended their alarm to the other mules, who began to rear and prance in the water. Just at this moment the last wagon, which had been behind,

attempted to pass us, the driver thinking the other mules would follow his team; but in the attempt, the current swept his wagon, which was half buried in the water, against ours. This brought his mules nearly abreast of mine, and led to greater confusion and alarm. Every moment we expected to be swept away; in which case our lives would have been in great danger, as it would have been no easy matter to extricate ourselves from the close wagon. I could do nothing but call for assistance from the party on the opposite bank, who stood watching our progress and critical situation with breathless suspense. Mr. Clement Young, seizing the end of a picket rope which lay on the bank, sprang into the river without stopping to divest himself of his clothing, and came to our relief. With great difficulty he succeeded in attaching the rope to the leading mules. Several other gentlemen mounted their horses and sprang into the water at the same time, some to urge the mules towards the shore, and others to extricate the two wagons. The picket rope was now seized by those on the bank, who, pulling with all their strength, brought the heads of the leading mules towards it. The teamsters then putting on the lash, and the horsemen in the water urging our animals forward, they relieved us from our perilous situation, and we gained the bank in safety.

My carriage was now brought over by lashing beneath it a few empty kegs, with two men in the water to keep it steady. A rope was taken ahead, by means of which the men on the opposite bank drew it safely across. We now pitched our tents, corralled the wagons, and, after a hearty supper, turned in for the night.

October 31st. Struck tents and left camp at 7 o'clock, following a northwesterly direction, keeping near the Pecos, the course of which we could occasionally trace by the rushes which grew on its banks. The country continues exceedingly barren and destitute of trees or shrubs, except the thorny chapporal, which generally grows on desert spots. A short grass appears here and there, but is now completely dried up, affording but little nourishment to the animals. Beautiful yuccas were seen in many places, seeming to thrive in the barren soil. Our constant companion, the prickly pear, with other varieties of the cactus family, were content, too, to flourish in these dreary abodes.

The only living creatures seen to-day were a few blackbirds sitting on the mezquit bushes, so near the road that one might have struck them with a cane, and a herd of antelopes. The latter bounded before us, and were lost to view before our hunters could surround them. The ground beneath us seemed to afford habitations for various burrowing animals, judging from the numerous holes seen by the road side; but we had no time or means to discover what they were. I presume however that they were the habitations of ground rats and mice, coyotes, polecats, moles, rabbits, rattlesnakes, tarantulas, and other reptiles. As there are no rocky ledges, no thick bushes, or decayed logs or stumps in which these animals can burrow, they must resort to the earth; hence the vast number of holes which are seen in all such barren and desolate regions. Every animal here named I have myself seen, at various times, enter or make its exit from subterranean abodes. After some difficulty we found

a spot near the river which afforded tolerable grazing for the animals, where we stopped, pitched our tents, and formed our corral. The banks of the river being high and precipitous, it was with difficulty that we watered our animals. One of the horses, in his eagerness to reach the stream, fell over the bank, and was extricated only by the great exertions of the party. A mule, which had exhibited symptoms of illness for several days, gave out to-day and was abandoned. It was a serious loss to us, for we had already lost four; and although the weight of our provisions was daily growing less, the weakness of the animals increased still faster, from their long journeys and insufficiency of food. The mercury stood at noon to-day at 82° Fahrenheit.

November 1st. Determined to make an early start this morning, for which purpose the camp was called at 4 o'clock. Got breakfast and were off at daylight. A little rain fell during the night. The wind was north; but the weather was warm, and our fears of a "norther," so much dreaded by all prairie travellers, subsided with the appearance of a bright sun.

Our march to-day has been through a region as barren and desolate as that of yesterday. Continued near the river, avoiding its windings. Noticed large spots covered with a saline efflorescence; in fact, on examination, the whole earth seemed impregnated with it. The water of the Pecos, which here is quite brackish, doubtless derives this flavor from the soil through which it passes. Patches of dry grass and stunted mezquit constitute the chief vegetation. Yuccas and cacti are thinly scattered over the plain: the

former, sometimes appearing in groups, seemed like bodies of men; and many were ready to see an Indian in every resemblance to them which our journey afforded. Passed the carcasses of five oxen lying about the road; from which we concluded that they had belonged to some emigrant train, and had dropped down from exhaustion, and perished where they fell. Their lank bodies were dried up with the skins still adhering to them, showing that even wolves do not attempt to find a subsistence on this desolate plain. The remains of wagons were also seen along the road, and furnished our cook with fire-wood, an article which he had had much difficulty in procuring since leaving the Concho River, and particularly since we struck the region near the Pecos. Small brushwood and the roots of mezquit bushes had been our resort for fire-wood for several days. Perhaps it was well for us that we had no fine joints of meat or steaks to cook, with such fuel; but to fry a bit of pork, to boil some beans, and make coffee, which constituted our chief cooking, a little dry brush answered very well.

We had another windfall to-day in meeting with two oxen, which were pursued and taken. They proved rather lean; nevertheless they were an important addition to our stock of provisions. Took only their hind quarters, which would last as long as they could be preserved. Meat may be kept in this region by cutting it into strips and drying it in the sun; but we had not time to do this.

Stopped to water, and to our surprise found a beautiful fall in the river, eight or ten feet in height. It flowed between high banks of clay, resting on a

base of conglomerate, over which it dashed with a life and beauty which contrasted pleasantly with its usual dark and treacherous flow. The banks near the fall are high and perpendicular, and expose many thin strata of various brightly colored deposits of sand and marl, presenting a singularly beautiful ribbon-like appearance. A small island or rock, overgrown with rushes, divided the fall. On tasting the water, it was found to be less brackish than at the Crossing. This fall is not noticed on the maps of the country. Passed a stray mule, which, looking plump and strong, I felt desirous to transfer to our wagons. Two or three men went in pursuit of him with lariats; but he outstripped them all, and disappeared in the chapparal. At four o'clock, stopped on the bank of the river, near a rapid, where we found the water accessible, and excellent grass for our animals.

Finding our stock of provisions was fast diminishing, I ordered an account taken of them. There proved to be but three hundred and sixty pounds of hard bread, or about ten pounds for each man, which was accordingly divided in this proportion among all. With the usual allowance of a pound a day for each, there was bread enough for ten days. As we could hardly expect to reach El Paso within that time, each man could govern himself accordingly, and save as much as possible for an emergency. But scanty as was our stock, it was unfit to be eaten, being completely riddled with *weevils*. Hundreds of these insects were found in a single biscuit. To remove them was out of the question; and there was no alternative but to shut the eyes and munch away. Of salt pork there

was about a half allowance for ten days. The coffee and sugar was all gone.

November 2d. Our route kept on in a westerly course, near the river, which we occasionally distinguished on our right by the rushes and other plants peculiar to salt marshes, which grew upon its banks. The same barrenness continues, with scarcely a living object. A few blackbirds and sparrows are all that have been seen. Passed five more dried carcasses of oxen lying by the road. Fell in with a cow and yearling calf, and after a pretty good chase succeeded in lassoing the cow. She would not, however, consent to be driven with the train, when she was tied behind a wagon; but so furious did she become at being deprived of her liberty, that it was found necessary to shoot her. The calf was then followed a mile or more, and shared the same fate. Both proved very fat, and a most welcome addition to our supply of food in its diminished state. Passed several depressions near the river, which appeared to have been filled with water. A white efflorescence on their surface showed the extent of the saline matter with which the soil was impregnated. Crossed an *arroyo* or dry bed of a stream, covered with the salty incrustations before alluded to, which we took to be the "Toyah Creek" of the maps. At four o'clock, encamped on the margin of the Pecos, about two miles from the creek. The shrubbery to-day exhibits a larger growth than any we have seen since we crossed the river.

November 3d, Sunday. I was desirous to rest to-day; and had we been any where except on the banks of the Pecos, I certainly would have done so.

But a due regard for our safety rendered it necessary that we should not stop until beyond its waters and the miserable barren region near it. Should a rain set in, it would make the roads almost impassable for loaded wagons, so tenacious is the soil. The grass, too, but barely sustained life in our worn-out animals. We saw around us evidence of what the road would be in wet weather. Some teams seemed to have passed over it at such a time, leaving ruts six inches deep in the soft, muddy soil. Every day we noticed the clouds with fear and trembling, and watched each change in the weather. The roads are now hard and smooth, and have been so since we struck the river.

Our route has been over the same flat and desert plain before described. Not a living thing has crossed our path, beast, bird, or reptile, except two large white swans, which were doubtless winging their way to more attractive regions. They lit on a marshy place, which I endeavored to approach; but even in this out of the way spot, which the human foot seldom treads, they flew at my approach. Scattering patches of dried grass, with low chapporal, and an occasional yucca, constituted the vegetation of the twenty-two miles passed over to-day. In order to find a good spot for our encampment, two or three of the party diverged from the road, and succeeded in discovering a little nook on the river's bank, where there was good grass. Several hours before stopping, we got a glimpse of the Guadalupe Mountains, and a range of hills through which we must pass, although more than 100 miles off in a direct line, in a north-westerly direction. Mounts Diavolo and Carrizo, which

had been visible to the westward, seventy or eighty miles distant, since crossing the Pecos, to-day were lost to our view.

Passed the carcasses of four cattle by the road side; and in another place, where there was a slight depression in the plain, and where water had at some time accumulated after rains, there lay the carcasses of five more, which had doubtless mired in endeavoring to satiate their thirst. Portions of wagons, boxes, and barrels were also noticed along the road.

November 4th. Still journeying along the river. Barren plains continue, with fewer mezquit than before. Dried grass and weeds prevail. Many carcasses and skeletons of oxen, and several skeletons of mules, marked our route to-day, as well as the remains of broken wagons. As the prairie did not furnish us fuel to make our fires, we gathered up the fragments of the wagons and carried them with us for the purpose. Noticed along the road recent tracks of Indians, horses, and mules; or, in the language of the country, "Indian sign." The tracks of the animals showed that they were unshod, which would not have been the case if it had been an American party. Next we observed prints of moccasins, which are easily distinguished from the American shoe, or from the sandal or moccasin of the Mexicans. Then the freshness of the foot-prints and of the dung, showed that the party could not have preceded us more than a few hours. In this belief we were strengthened by seeing large fires some fifteen or twenty miles off on the prairie, early in the evening.

Much sagacity is shown by experienced hunters

and frontier men in detecting "signs" on the prairie, when and by whom made, the strength of the parties, their direction, etc., whether Indians, Mexicans, or Americans. So with the places where there have been encampments. These the wary traveller on the prairie inspects with care, to see whether friend or enemy has preceded him. If Indians, he will find poles from their wigwams, fragments of skins, scraps of leather ties, beads, etc.; and a little experience will enable him to distinguish the tribe, whether Comanches, Lipans, or Apaches. The principal characteristic, I believe, is the form of their wigwams. One sets up erect poles, another bends them over in a circular form, and the third gives them a low oval shape. There is also a difference in their moccasins, and the foot-prints they make. I know not the precise form of the Comanche and Lipan moccasins; but the Apaches assured me they could tell the foot-prints of the Comanches, the Mescaleros, the Yutas, the Coyoteros, or the Navahoes, and pointed out the distinctive marks of several. Different tribes of Indians have their peculiar fashions as well as civilized races, which are chiefly shown in their modes of dressing their hair and their coverings for the feet. American emigrants or travellers leave many marks to indicate their nationality and character, such as scraps of newspapers, bits of segars, fragments of hard bread, pieces of hempen rope, and other things. Mexicans would not be likely to have either of the articles named, but would be detected by the remains of cigarritos (small paper segars), pieces of raw hide, which they use instead of rope, etc. Or if they left

any portion of their camp equipage, or cooking utensils, they would differ from those of Americans. The remains of their food, too, would differ. Tortillas, tamaules, frijoles, Chili colorado, and dried beef would appear; instead of hard bread, fried pork, beef-steak, etc.* If a Mexican wears a shoe, it will be very different in form from an American one.

The extent of a party is shown by the number of foot-prints. This cannot be told while it is in motion, as there may be a large number of animals driven in a herd with but few riders; but when the camp fires are examined, the number of persons can be detected with a considerable degree of certainty. The freshness of the foot-prints, the dung of the animals, and other signs show how recently a party may have passed; and there are other marks by which its rate of travelling can be ascertained.

Many are complaining to-day of illness, from indulging in fresh meat. It is hard to restrain travellers who have been living on salt pork, and but a scanty allowance of that, when a superabundance of fine fresh beef and veal is placed before them.

I have omitted to mention an incident that occurred, one of those which help to make up the chapter of events, and show the difficulties of our mode of travelling. Soon after we retired, there was a cry from the guard of "Turn out all hands, a mule in the river." The men all rushed from their tents, lanterns were lit, and

* *Tortillas* are their cakes of corn, or wheaten flour. *Tamaules* are minced meat, rolled up in corn shucks, and baked on coals. *Frijoles*, dark Mexican beans. *Chili colorado*, red peppers.

ropes taken to rescue the animal; for we could not afford to lose another. It appeared that in grazing too near the bank, which was here some ten or fifteen feet above the river, and very precipitous, he had fallen over. Several men descended by the aid of ropes, and searched along the bank; but the poor creature could not be found, and it was supposed that he had been swept away by the current. When about to move this morning, a neighing was heard on the opposite side of the river, which proved to proceed from our lost mule. One of the men swam across with a rope, pursued and captured him and forced him over the steep bank, when he was drawn across the river. The bank was then levelled, and, by hard lifting and pulling, the animal was raised up and brought back in safety.

Encamped at half-past three P. M. after travelling hours; our mules coming in greatly fatigued.

November 5th. Intended making an early start this morning; but when we came to hitch up the poor mules, they looked so lank and miserable, that we thought it best to turn them out again for a few hours to graze. Again we pursued our course along the river for a few miles, when we left it in the hope that we should not see it again; but we were doomed to disappointment, in coming plump upon it an hour after. We had now followed its dreary and monotonous banks for six days, and longed for a change of scene. Even the jornada of sixty-five miles presented novelties which the Pecos had not. The constant fear of being overtaken by a storm, the brackish water, and that always difficult to obtain, the miserable grass, and the deficiency

of wood helped to render this portion of our journey most disagreeable; and but for the broken wagons that were providentially left in our way, we could not have procured wood enough to cook our food. The river and adjacent country here present the same aspect as below. In width it now varied from fifty to ninety feet, with steep banks of clay or sand from twelve to twenty feet in height. Its rapidity may be somewhat less than at the Horse-head Crossing.

On stopping to water our animals at the last halt made on the everlasting Pecos, one of our Mexican horses was suffered to nibble at the scanty grass on the river bank, while the party were taking a lunch. His dangerous situation was observed by one of the teamsters, who stepped forward to lead him away. Resisting the benevolent intention thus manifested towards him, the animal, as a matter of course, determined to progress backwards; and over the bank he went, nearly dragging the man after him. The bank was here full twenty feet high, one half being perpendicular, and the other, formed of the debris, nearly so. We all rushed to its edge, expecting to witness the last struggle of the poor beast, when, to our surprise, we saw him on his feet nearly covered with water. The comical look of the animal, as he rolled up his eyes at us, and the predicament he had placed himself in by his stubbornness, brought forth a hearty laugh from all. A man was let down by a rope, who succeeded in bringing him back to the camp none the worse for his fall and somerset.

Leaving the Pecos we took a direction a little north of west over a range of hills composed of gravel and marl. The road pursued a winding course among the

hills and across deep ravines. At one place we stopped to look at some limestone sinks near the road. The earth and stone had caved in, or sunk, in spots varying from ten to thirty feet in diameter. The ground for some distance around appeared hollow and cavernous. The country since leaving the river was well covered with grass, but entirely destitute of trees or shrubs. At 4 o'clock reached Delaware or Sabine Creek, sixteen miles from the Pecos, and pitched our tents on a spot where there appeared to have been a very large encampment a few months before. Besides the fragments, there was one large Pennsylvania wagon nearly complete, numerous ox-yokes, boxes, barrels, etc., etc. These were collected and carried to our camp for fire-wood; and very acceptable they proved, for the banks of the creek did not furnish a bit of wood as large as one's finger. As the grass was abundant here and of the best description, with excellent water, I determined to halt to recruit the animals, and gave orders accordingly. The poor creatures were much in need of rest, for several had already given out and had to be removed from the wagons. Two colonies of prairie dogs were seen to-day after leaving the Pecos, the first we had noticed since leaving the great jornada beyond Castle Mountain.

November 6th. Was aroused in the night by the whistling of the wind. Feeling a great change in the temperature, I looked out of my carriage window, and to my surprise found the ground covered with snow. There was no sleep after this; and as soon as morning dawned, I got up to inspect the condition of the party and the animals, and to see what could be done for

their comfort. The dreaded Norther I had so much feared when near the Pecos, had now come upon us with all its fury and in its very worst shape, accompanied with snow. But bad as our condition was, it might have been worse. We had escaped the inhospitable region of the Pecos, where the water was unfit to drink, scarcely any grazing was to be had for our animals, and no wood wherewith to cook our food. Here the grass was excellent and abundant, the water was pure, and the calamities of others furnished us with broken wagons and other articles for fire-wood. But our poor animals had no shelter from the pitiless storm, there being not a tree to break the force of the keen blast which seemed to pierce them to the quick. A few isolated bushes grew near the camp, but nothing that afforded a covering. During the day, many wandered off, probably to seek a shelter; and at one time, ten men were gone in pursuit of them. Some of the horses had strayed seven miles before they were taken.

The only means to add to our comfort were to bank the earth around the tents to keep out the snow and the cold blasts; to bring our overcoats and India-rubber garments into requisition; and to keep up as large fires as the broken wagons and boxes would admit of.

Finding it very hard to keep warm even by the fire, with the cold wind and snow beating on my back, I laid aside my heavy blanket, put on my India-rubber cloak and long boots, and took my double-barrelled gun to see what virtue there was in a little sport by way of exercise. The result proved to be better than remaining still, roasting and freezing alternately by the fire. The excitement and exercise restored the circulation,

and the satisfaction of procuring several brace of ducks amply repaid the hardship of facing the storm. Removing my India-rubbers I again wrapped my blanket around me, seated myself in my carriage with Dr. Webb, and there spent the remainder of the long day in reading Erman's Travels in Siberia, a proper book for the occasion. The young men took it very calmly, spending the time at the camp fires or in their tents. So passed the day.

November 7th. In camp, on Delaware Creek. Passed a cold and sleepless night. The sharp wind found its way through the openings in the carriage, which all the blankets I could pile on would not keep out. The young gentlemen crowded themselves in their tents, and lay as close as possible; while the teamsters, laborers, etc., stowed themselves in the wagons. The morning was sharp and cold; the snow continued to fall, and the wind remained at the north, though blowing less than the previous day.

I was desirous to resume our march; but the teamsters and others, whose experience among mules was greater than mine, thought it impracticable. To do so they said would result in our discomfort and perhaps ruin: for the animals would assuredly give out and leave us much worse off than we were at present. I yielded to their representations and determined to remain a while longer: for we were in a good encampment with grass and water at hand, and the flooring of our tents was dry—a consideration of great importance. No one had taken cold or shown symptoms of illness. Before leaving San Antonio my friends told me that at this season of the year we could

hardly expect to escape the Northerners, and advised me if overtaken by one not to move, but encamp at once, and keep quiet until it had passed. But in determining to remain I thought it most prudent to send a small party in advance to El Paso, now about one hundred and sixty-five miles off, for assistance.

I ordered another inventory to be made of our provisions, and found nothing remaining but a limited supply of hard bread and pork; every thing else was gone. If we kept on, we might reach El Paso by parching the few remaining bushels of corn and taking an occasional *mule steak*; but if compelled to remain here two or three days we should be reduced to a very short allowance. Messrs. Thurber, Moss, and Weems at once volunteered their services to go to El Paso. No time was lost therefore in fitting them out. They selected three of the hardiest riding animals; put up four days' provisions, which they put in bags and hung to their saddles; fastened their blankets behind them; and set off in the midst of the storm, two hours after it was determined to send them. One of the teamsters named Pratt, a very useful and energetic man, accompanied them. I gave them the following letter to Major Van Horne, commanding at El Paso:

"MEXICAN BOUNDARY COMMISSION IN CAMP,
"Delaware Creek, Nov. 7, 1850.

"SIR: I reached this place on the afternoon of the 5th instant with a portion of the United States Boundary Commission, having left the main body at San Antonio to follow immediately. My desire being to reach El

Paso as early as possible after the first of November, we took provisions but for thirty days.

“I now find myself overtaken by a Norther and severe snow-storm; my animals are much reduced by fatigue, and there is a probability that I shall fall short of provisions, in case the storm should continue. Under these circumstances I have deemed it prudent for the safety of my party to send four of them to El Paso, to procure aid to enable me to reach there as soon as possible. In the meantime I shall advance as soon as the weather will permit, and hope to reach the Guadalupe Pass in season to meet the return messenger.

“I shall be glad if you can send to my aid the following, viz.: ten mules, to be returned in good condition; and bread, pork, sugar, and coffee sufficient for my party for five days: for which I will pay you on my arrival.

“I am, very respectfully,

“Your obedient servant,

“JOHN R. BARTLETT,

Commissioner.

“To Major J. VAN HORNE,

Commanding,

El Paso del Norte, Texas.”

CHAPTER VI.

DELAWARE CREEK TO EL PASO.

Difficulty of proceeding—Set out with a small party in advance—View of Guadalupe Mountain—Boiling Spring—Deceptive clearness of the atmosphere—Guadalupe Pass—Descent to the plain—Meet Mr. Coon's train—Hospitality—Mr. Thurber's note—Take leave of the train—Cornudos del Alamo—Thorne's Well—Ojos del Alamo—Waco Mountain Pass—Waco Tanks—Meet Messrs. Thurber and Weems on their return—Arrival at El Paso—Itinerary of route—Remarks on the country traversed—Its adaptability to a public road.

November 8th. Camp on Delaware Creek. With great delight I rose from my carriage bed this morning at the first peep of day, to find the weather had moderated. Soon after the sun beamed forth in all his splendor, and with it the hope that we should be able to resume our journey. After a few hours delay in packing the tents, arranging our camp equipage, and drying the collars of the mules, the pleasing sound was heard from the teamsters of "All ready!" when we left camp, and, immediately crossing the creek, emerged on the more elevated bank beyond. The dry earth and the warm sun soon absorbed or evaporated the snow, so that our progress was but little impeded. But we had not proceeded many miles before the mules showed symptoms of fatigue and suffering from

the effects of the cold. Several gave out entirely, hung their heads, and sank to the ground, or refused to move further. These were necessarily removed from the teams, so that several of the wagons were reduced to two feeble mules. As my carriage mules were in better condition, I had got some distance in advance, when word was brought me that the animals were giving out so fast that it would be necessary for us to encamp at the first place where good grass and water could be found. A few miles further brought us again to Delaware Creek, where, finding good grass as well as fuel, we stopped and encamped. Dr. Webb and myself walked the entire distance to-day. An examination of the mules soon showed that in their present condition our progress must be very slow, not exceeding twelve or fifteen miles a day; and that it would be absolutely necessary to give them a couple of days' rest where there was good grazing. This delay would destroy all my plans of reaching my place of destination within the period required, and exhaust our provisions before the supply sent for could arrive. I determined, therefore, as my carriage mules were in good order, to push on myself. With this view I made up a party consisting of Dr. Webb, Messrs. Murphy, Cremony, Matthews, Young, and Thompson; these, with my carriage driver and another, made eight persons, a party I believed sufficiently strong to go through in safety. We selected good animals, and made such preparations as were necessary during the afternoon and evening, to insure an early start in the morning. A sack of our remaining corn was lashed to the axle-tree of my carriage for the mules. Some salt

pork was cooked, which, with hard bread, was stowed inside, while the unoccupied space inside and out was filled with bedding. A tent could not be taken, as the carriage was already too heavily burdened.

November 9th. Up at four o'clock; took a hearty breakfast, and was ready to move as soon as there was sufficient light to see the road. Started at a lively pace, intending to make a good march. The road was quite tortuous, winding among and over hills, in a direction nearly west, towards the bold head of the great Guadalupe Mountain, which had been before us some eight or ten days. This is a most remarkable landmark, rising as it does far above all other objects, and terminating abruptly about three thousand feet above the surrounding plain. The *sierra* or mountain range which ends with it, comes from the north-east. It is a dark, gloomy-looking range, with bold and forbidding sides, consisting of huge piles of rocks, their *debris* heaped far above the surrounding hills. As it approaches its termination the color changes to a pure white, tinted with buff or light orange, presenting a beautiful contrast with other portions of the range, or with the azure blue of the sky beyond; for in this elevated region the heavens have a remarkable brilliancy and depth of color.

The low hills we passed are woodless, and sparsely covered with grass. Limestone occasionally protrudes from the hills, while the soil is hard and gravelly, with an occasional patch of sand. Stopped to water the animals at the head waters of Delaware Creek, probably Walnut Creek, about fifteen miles from camp, when we continued our course towards the head of the Guada-

lupe Mountain, reaching a boiling spring about five o'clock. There are here three fine springs, one of which tasted strongly of sulphur; the second seemed impregnated with salts of soda, while the third was very pure. Found good grazing in the valley where we stopped, with a little grove of trees, a pretty place to have spent a day in, had circumstances rendered it proper; but while our animals were in a condition to move, I determined to press them to their utmost. Estimated distance travelled to-day, thirty-five miles.

The Guadalupe had been before us the whole day, and we all expected to reach it within a couple of hours after leaving camp. But hour after hour we drove directly towards it, without seeming to approach nearer; and finally, after journeying ten hours, the mountain seemed to be as distant as it was in the morning. Such is the great clearness of the atmosphere here, that one unused to measuring distances in elevated regions is greatly deceived in his calculations. When this mountain was first discovered we were more than one hundred miles off. Even then its features stood out boldly against the blue sky; and when the rays of the morning sun were shed upon it, it exhibited every outline of its rugged sides with as much distinctness as a similar object would in the old States at one fifth the distance. Often have I gazed at the Katskill Mountains in sailing down the Hudson; and though at a distance of but twelve miles, I never saw them as distinctly, as the Guadalupe Mountain appeared sixty miles off.

For several miles before reaching the springs we

GUADALUPE MOUNTAIN, TEXAS.—p. 118. vol. 1.

had in vain tried to pick up wood enough to make a fire; but none could be found, not even roots or brush-wood. Still the good fortune which had attended us in our journey did not desert us here. A disabled wagon, with its large box, lay near the springs. This not only furnished us with fuel for a fire, but the box, which was whole, served as a sleeping-place for four of the party. This was placed on one side of the fire, and the carriage drawn up on the other. As we were near one of the notorious lurking-places of the Apaches, a strict guard was kept up, and relieved every hour during the night.

November 10th. Two hours before day my carriage driver was out with the mules to give them an early feed, while we managed to make a pot of tea from a canister, which I always carried with me for such occasions. This, with cold pork and hard bread, made our breakfast; but meagre as it was, it was taken with a relish. We then filled our leather water tank, and were on our journey before the sun peeped over the adjacent hills to our left. No sunrise at sea or from the mountain's summit could equal in grandeur that which we now beheld, when the first rays struck the snow-clad mountain, which reared its lofty head before us. The projecting cliffs of white and orange stood out in bold relief against the azure sky, while the crevices and gorges, filled with snow, showed their inequalities with a wonderful distinctness. At the same time the beams of the sun playing on the snow produced the most brilliant and ever-changing iris hues. No painter's art could reproduce, or colors imitate, these gorgeous prismatic tints.

Five or six miles, over a hilly though very hard road, brought us to the base of the mountain, where we noticed a grove of live-oaks and pines, with water near them; but as it was too early to water our animals, we did not stop. At this spring a train was attacked a few months before we passed, and four men killed. As we now began to descend, I got out of the carriage, preferring to go on foot. I could thus the more readily lock and unlock the wheels when necessary. The road here, after passing through long defiles, winds for some distance along the side of the mountain. Now it plunges down some deep abyss, and then it suddenly rises again upon some little castellated spur, so that one almost imagines himself to be in a veritable fortress. Again we pass along the brink of a deep gorge, whose bottom, filled with trees, is concealed from our view, while the evergreen cedar juts forth here and there from the chasms in its sides. Winding and turning in every direction, we followed the intricacies of the Guadalupe Pass for at least six hours; and whenever the prospect opened before us, there stood the majestic bluff in all its grandeur, solitary and alone. In one place the road runs along the mountain on a bare rocky shelf not wide enough for two wagons to pass, and the next moment passes down through an immense gorge, walled by mountains of limestone, regularly terraced. As we were descending from this narrow ledge, the iron bolt which held the tongue of the carriage broke and let it drop. Nothing but iron would do to repair the injury; and after trying various expedients, a substitute for the broken bolt was

found in the bail or handle of the tin kettle which held our provisions. This, being doubled and driven through the hole previously filled by the bolt, kept it in its place, while the tongue was supported by cords. By careful driving, and relieving the weight of the carriage by alighting when going over bad places, we got along tolerably well.

I regretted that we were not able to spend more time in this interesting Pass, the grandeur of which would, under any other circumstances, have induced us to linger; but we had too much at stake to waste a single hour. Many new forms of cacti were seen here; and upon emerging from it, we observed in quantities the *fouquiera* (I know no other name for it) covering the gravel knolls. This singular shrub throws up from just above the surface of the ground numerous simple stems, eight or ten feet high, armed with sharp hooked thorns.

On reaching the summit of the line of hills, which completely surround the Guadalupe range on the western side, we looked down upon a broad plain, stretching out as far as the eye could reach. The Sacramento Mountains, which are but the continuation of the Guadalupe range, extend from east to west for a distance of more than a hundred miles, terminating, like the latter, in a bold bluff, when another range seems to intersect them from the north. Far to the north-west we could see the *Cornudos del Alamo* like two great mounds rising from a vast plain, while to the south-west the horizon was bounded by a faint blue outline of mountains, with jagged tops. The plain appeared level from the height at which we viewed it,

and was interspersed with what looked like silvery and tranquil lakes, glittering in the sun, seeming, as it were, to tempt the weary traveller to their brink. Our young men cried out "Water!" delighted with the idea of again enjoying this luxury after a long day's ride. But the whole turned out a delusion; what appeared to be the glassy surface of a lake or pond, being nothing but the saline incrustations of a dried up lake. The vast plain, or desert, as it may with more propriety be called, as far as the eye could reach, was dotted with these saline depressions.

Before we had got through this pass we came upon another broken wagon, and among its iron work were so fortunate as to find a bolt precisely the size of the one we had broken. The wire was quickly knocked out, and the bolt inserted in its place; after which the driver put on his whip, and we rolled over the hard and excellent road at a rapid pace.

The summit of the mountain appears to be covered with heavy pine timber; but its rocky sides exhibit no foliage, except in the deep chasms which run from it in every direction. At its base, too, we noticed large trees of pine, oak, cedar, etc.

We had now ridden the entire day without water for our animals, not discovering a spring which is noted on the map as *Ojo del Cuerpo*, and at which I had proposed stopping. Our leather tank was empty, and I began to feel anxious on our own account, as the next water laid down on the map is at the *Cornudos del Alamo*, thirty miles distant. The road was now pretty good, and we went over it on a fast trot. On the left we passed a range of hills of pure white sand, the

same we saw when the plain first opened to us, and which we supposed to be water, and a few miles further the dry bed of a lake, with a white surface, appearing also like water. It was quite rough and hilly here. Clumps of bushes grew in the intervening valleys, which I sent parties to examine, in the hope of finding water, but without success.

While pondering whether to push on or encamp where we were, without water, we discovered far off in the plain, directly before us, what appeared to be a large encampment. Smoke was curling up from many fires; and we descried a long line of white objects. Took my spy-glass, and discovered the white dots to be so many wagons stretching over the plain; all which assured us we had nothing to fear. The pleasant prospect of again meeting with our countrymen quite raised our drooping spirits. The weary animals, who doubtless smelt the water, as mules always do, from a great distance, seemed to rouse themselves to new exertions. A rapid drive of four miles brought us to the encampment, which proved to be a train of about sixty large wagons, with government stores, bound for El Paso. It belonged to Mr. Coons, and left Indianola, on the coast, in April, and San Antonio in June last. After sustaining extensive losses of wagons and animals, they arrived here fifty-six days before us, and were forced to remain, as there was not water between this place and El Paso for so large a number of animals as they had with them. The distance was said to be about one hundred miles. Their wagons were mostly drawn by oxen, which could not travel more than fifteen miles

a day, and would therefore require six days to reach their place of destination. The train here was in charge of Mr. Percy, who, after waiting several weeks in the hope that there would be rain, had sent a messenger to the commanding officer at El Paso, informing him of his situation, and requesting assistance. Parties were now on their way from the Rio Grande, bringing water in barrels, which were to be deposited at several points for the use of the animals, to enable them to complete their journey.

On approaching the encampment we were surrounded by sixty or seventy teamsters, who, ragged, dirty, and unshaven, crowded around us; for, with the exception of Mr. Thurber and his party, who had stopped here the day before, they had seen no one from the "States" since their departure from San Antonio in June. They had had a long and painful journey to this place, and suffered much for the want of water. Their animals had given out in many places, which had caused hundreds to be left behind; and many of their wagons had been disabled or rendered useless for want of means to draw them. Besides draught animals, a large herd, embracing several hundred beef cattle, had been driven with the train; and among these there had been great mortality. The stray cattle we had seen, and a few of which we had secured, were doubtless some which had luckily been left near a spot where there was grass and water, which enabled them to recover their strength.

Mr. Percy, the gentleman in charge of the wagons, gave us a warm reception, and kindly offered to let me have the provisions I was so desirous to procure for the

relief of the party I had left behind, on my giving a receipt for them to the U. S. Quarter-master on my arrival at El Paso. Having eaten nothing since daylight, we feasted with great relish on our cold pork and biscuit. Our generous host ordered supper for us, but we were too hungry to wait; though I believe most of the party accepted his invitation, and did full justice to a second meal before retiring to their blankets. Mr. Percy, who had the only tent in his party, gave places to as many as could stow themselves within it. Estimated the distance travelled to-day to be thirty-eight miles.

November 11th. In camp at Salt Lake, near Guadalupe Mountains. The lake, or rather pond, near which we are encamped, is a small body of water covering three or four acres, surrounded on all sides by an open prairie or plain, in which there are scattering bushes, with patches of pretty good grass: no trees are to be seen, nearer than the base of the mountain. The pond is resorted to by wild ducks, plover, and other water-fowl, in great numbers; but the continued proximity of so large a body of men as Mr. Percy's party, has made them less plentiful and quite shy. Still I managed to shoot a few before breakfast.

The following note left here by Mr. Thurber, gives the particulars of his journey. It was intended to be sent to the spring at the Guadalupe Pass.

COON'S CAMP, near Salt Lake,
November 9, 1850.

"SIR: After leaving you at the camp on Delaware Creek, we made the best progress the storm would permit. The snow balled in the feet of our animals so

badly, that we were forced to halt about 11 o'clock at night. We bivouacked in the snow without fire. On the morning of yesterday, we were obliged to melt snow in order to obtain water for our breakfast. We found the road through the mountain, particularly in the gorges, much obstructed by snow of such an adhesive nature, that our animals could work their way but slowly, although without their riders. We found but little snow in the most difficult portions of the pass. Pratt's horse became so completely disabled, that we had great difficulty in urging him along, and have been much delayed on his account. We did not succeed in finding the "Ojo del Cuerpo," which, according to Ford and Neighbors, "breaks up in the plain;" but we were obliged to encamp without water for our animals, and with but a gill for each of ourselves. This morning we started very early, and soon came in sight of an encampment, which, on reaching it, we found to be Coon's train, which left San Antonio on the 10th June, with government supplies for El Paso. This is the train whose stray cattle and broken wagons have so frequently furnished us with food and fuel, since crossing the Pecos. We were received with great hospitality by Mr. Percy, who is in command in the absence of Mr. Coon.

"I would suggest the propriety of stopping at the spring, at the base of the mountain, where there is good grazing, and to recruit the animals before attempting the pass. I fear we shall be obliged to leave Mr. Pratt here, as his horse is utterly unable to go on.

"A party of men are going back as far as the spring

alluded to above, to herd oxen. I shall send this letter and a small supply of sugar and coffee by them. Mr. Scallen, the bearer of this, will direct you to watering places this side of the pass, which we missed, not knowing where to find them. It will be necessary to fill up the water kegs here. The water, though smelling strongly of sulphuretted hydrogen, is not unpalatable. All kinds of provisions are very high and scarce in El Paso. Flour is \$92 a barrel; coffee, sugar, and pork, 50 cents per pound. We are all in good spirits, and move from here at noon.

“Very truly, your obedient servant,

“GEORGE THURBER.

“JOHN R. BARTLETT, Esq.
Commissioner.”

After partaking of a hearty breakfast, provided for us by Mr. Percy, we made preparations to start, determined to press through, believing that we should find water enough for our small party at the three springs, or watering places, between us and the Rio Grande, which was yet about one hundred and eight miles off. But we had expectations from another source: as Mr. Daguerre, who had just arrived from El Paso, informed me that his wagons were on the way to the camp bringing water for Mr. Coon's train, which they were depositing at certain points on the road; and he most generously gave me permission to use it, if we found none at the watering places, and should require it for ourselves or for our animals.

While making our preparations to start, Mr. Percy filled our kettle with some excellent boiled beef, bread,

coffee, and sugar,—an acceptable addition to our stock of pork and hard bread, which, though very good, was not sufficient to carry us to our journey's end. In fact, but for this assistance, we must have come on short allowance at once.

After putting up a barrel of pork, with a quantity of bread, sugar, coffee, etc., which our host undertook to send back immediately to the spring at the foot of the mountain, for the party we had left behind, we took leave of our good friends, and dashed off in fine spirits for Thorne's Wells, in the mountain, called the "Cornudos del Alamo," or Horns of the Alamo, thirty-three miles distant, which I hoped to reach before dark. The road was most monotonous for the first twenty miles; the great abundance of yuccas and cacti giving a strange and striking air to the vegetation. We saw splendid specimens of a large tree-like cactus (*Opuntia arborescens*). This is a much branched species, with clusters of yellow fruit at the ends of its long, horrible, spiny arms. Specimens were seen from six to ten feet high, and twenty to thirty feet in circumference. The country is slightly undulating, and not a level plain, as it appeared to be from the hills. The soil seemed barren, and in many places was covered with saline incrustations. Several dog-towns were passed. At noon, saw a great cloud of dust rising from the plain immediately ahead of us; which, as we drew near, was found to proceed from ten large wagons of ten mules each, belonging to Mr. Daguerre, on their way from El Paso, to relieve the train we had just left. At 6 o'clock, reached the *Cornudos del Alamo*, towards which we had been journeying since our start this

morning; and being unable at this late hour, it being now dark, to find the wells in the clefts of the rocks, we encamped without water. This wonderful mountain, of which it is impossible to convey any adequate idea by description, is a pile of red granite boulders of gigantic size, thrown up abruptly into the plain. The boulders are mostly of an oblong shape, with their largest diameter vertical; they are rounded and often highly polished. The interstices between the rocks form in many places extensive caverns. On the summit I noticed two projecting piles, or masses, which rose many feet above the level of the other portions in a conical form, resembling horns, whence I suppose originated the name "Horns of the Alamo"—the mountain itself being known as the Alamo. After building a fire near a rock (for wood was abundant around us), four of the party took a lantern and scrambled about among the rocks in search of water. It seemed a bold and hopeless undertaking for tiny man, guided by the dim light of a candle, to be probing the deep recesses of the mountain, and clambering over these gigantic boulders, which were piled up to the height of four or five hundred feet. But, when urged by his necessities, it is hard to say what he cannot accomplish. Within an hour, one of the party was so fortunate as to find in a cavity of a rock water enough to fill our tea-kettle, which had collected from the melting of the snow a few days before. After a cup of warm tea and a hearty supper, the carriage was drawn near the fire, when all bivouacked around it, and were soon lost in sleep.

November 12th. Being spared the trouble of boiling coffee, for want of water to make it withal, we did not

wait for breakfast, but set off before daylight. Before quitting the mountain, we journeyed along it for some distance, close to its base. We thus found a singular gorge, or glen, which led some fifty feet into the mountain, where it opened to the sky. Within this inner cavern-like place was a deep hole, which appeared to have contained water, and which we supposed to be the "Thorne's Well" of which we had been in search; but at this time, it was perfectly dry. Some large trees had sprung up in this singular place, and the rocky walls were highly polished, as if by the hand of man. There were other deep holes near the entrance, which we supposed had been dug by California emigrants in search for water. All around were indications that it had been a camping place for many parties. Near the entrance alluded to, were several carcasses of oxen, which had perished here before the well was dug.

Resuming our journey we rode ten miles to the Ojos del Alamo, or Cotton-wood Springs, on a hard and excellent road. Our landmark for this spring was a single cotton-wood tree, about five hundred feet up the side of a mountain, on our left. As the mountain was otherwise bare of foliage, save a few shrubs, the tree was easily seen, though from below it looked more like a bush; still its light yellowish green distinguished it perfectly from every thing around. Left the carriage at the base of the mountain, and clambered up to the springs, of which there are seven. The water was very good, though but little remained. Upon the faces of the rocks near were rude sculptures and paintings, made by the Indians. We led some of the ani-

mals up to the springs; and others, that would not make the ascent, were watered from the kegs which our friends had deposited at the base. Found a note from Mr. Thurber here, stating that his party had preceded us two days.

Turned our animals out to graze, as the grass was very good, and took breakfast. The Hueco, or Waco Mountains, our next landmark, lay before us here at twenty-five miles distance, and for them we now set out; but so clear was the atmosphere that they did not appear more than eight or nine miles off. The road, which led over a rolling prairie, was excellent. Not a tree was seen, and scarcely a bush the entire distance. The grass was poor and thin. At 2 o'clock reached the mountain, and at once entered the pass. Just before reaching it, the road divides, one branch leading to the right, the other to the left of the mountain. I was advised to take the latter, which was five miles shorter than the other, as my carriage could be easily lifted over a very steep place in the defile, which was impracticable for loaded wagons. The latter invariably take the longer route. The descent was gradual and easy, and led through a narrow defile along the base of the mountain, which lay close on our right. The road was very tortuous, with small hills and deep ravines to cross, though unattended with difficulties, until, after a long descent, we were obliged to follow an *arroyo*, or stony bed of a water-course. Here the way was exceedingly rough, so that I feared every moment to see the carriage upset or broken in pieces. We were finally brought to a stand, where the road or path, if entitled to either appellation, led precipitately over

a ledge of rocks some ten or twelve feet. How any wheeled vehicle ever got through here it was difficult to imagine. After an examination of the place, it was thought most prudent to take out the mules, which were led around the side of the defile, or through a chasm in the rock. We then took two ropes, and attached them to the hind axletree of the carriage. Wells, the driver, a stout and athletic man, took the tongue and guided the carriage over the precipice, while we let it carefully down by the ropes. In this way it was got

Waco Mountain Pass.

over in safety, and deposited on the gravelly bed of the defile. The mules were now hitched up again, and we continued our journey along the same sort of road for about a mile. This was an exceedingly grand and picturesque spot, differing from any thing we had seen on our route. On both sides the gray limestone

rocks rose perpendicular like walls. From the top and in the crevices of these, grew a variety of shrubs. A low range of rounded gravelly hills, covered with grass, but destitute of trees, bordered the defile; while about half a mile or less beyond, loomed up the great mountain, its almost perpendicular sides showing a dark brown granite from the base to its very summit. So steep is the mountain that it cannot be ascended except from the plain above. As we emerged from the narrow gorge, the same terraced and castellated rocks which we noticed at Castle Mountain appeared again, but in more strange and picturesque forms—now a fortification, and again some ruined town. These terraced hills opened into a plain or amphitheatre about three miles across, surrounded by hills and mountains, except on the north. Passing them, we reached the Hueco Tanks, and stopped beneath a huge overhanging rock.

The mountains in which these so-called "Tanks" are found, are two rocky piles of a similar character to the Cornudos del Alamo before described. The rocks, however, are thrown together in still wilder confusion, and are of more irregular forms. One mass extends about a mile along the amphitheatre above mentioned, and is about half a mile in breadth. The other, situated to the south, is separated by a narrow pass from that described. It, too, extends about a mile from north to south; but in other respects is very irregular, consisting of several vast heaps, quite disconnected. Much of this is granite in place, while gigantic boulders are piled up like pebble stones at its sides and on its summit. These piles are from one hundred to one hundred and fifty feet in height.

After a little search we found water in a great cavity or natural tank in the rock about twenty feet above our heads, containing about fifty barrels, pure and sweet. This tank was covered by a huge boulder, weighing some hundred tons, the lower surface of which was but four or five feet above the water. Searching along the base of the mountain we found another cavity, where we watered our animals. There remained yet another hour before dark; and as there was no grass near, I thought best to push on a few miles and stop wherever grass should be found.

The road leads between the great rocky masses described above, when it enters a plain beyond. We had scarcely passed the mountain when we met Messrs. Thurber and Weems, who were returning from El Paso, with ten mules and two men for the assistance of our train, which had been promptly furnished by Major Van Horne. We bivouacked together, after learning that we should find no grass further on. It was poor here, and only grew in tufts about the roots of the mezquit chapporal; but with the hope of terminating our journey on the morrow, we could rest easy. A supper was cooked with the brushwood of the mezquit; and the evening was spent in asking a thousand questions of our friends about what they had seen, and how civilized people again appeared to them.

November 13th. Breakfasted and resumed our journey before daylight, having twenty-five miles to make before its close. About three miles from the Hueco Tanks we passed a range of hills, when a broad plain opened upon us in every direction. Here we first got a glimpse of Mexico, in a range of mountains

which rises ten miles in the rear of El Paso. North-east of them were the El Paso Mountains, on the eastern bank of the river, which unite with the Organ Mountains or "Sierra de los Organos," whose pinnacles and jagged summits could be distinctly seen about sixty miles to the north-west. To the north, at a great distance, Mount Soledad was dimly seen; while at the south the long line of horizon was only broken by low hills, on the Mexican side of the river. A road branched off just beyond the low hills we had passed, leading to the town of Isleta, in a southerly direction. Our course now lay south-west, over a sandy and desert plain, covered with low mezquit chapporal. Grama grass grew in tufts or little patches here and there; which, though dry and apparently without sustenance, is eagerly eaten by mules. The country was exceedingly monotonous; and our tired animals could scarcely drag their loads through the deep sand, which continued the whole way without interruption. We kept rising gradually over the undulating table land which borders the Rio Grande, until at length we reached its highest level. Here the valley of that long looked-for river opened upon us. A line of foliage of the richest green with occasional patches of bright yellow and brown marked its course. The first autumnal tinge, which in our northern forests so beautifully indicates the earliest frost and reminds us of the coming winter, is here likewise apparent. But there is not that diversity of hue as with us,—no rich crimson, scarlet and purple; which is easily accounted for by the want of variety in the Mexican forest. Here the cotton-wood alone is found. Soon the houses were seen peeping

from among the trees; but when the "stars and stripes" were discovered curling in the breeze, a thrill ran through our veins which must be felt by those situated as we were to be understood. I had often read of the delight with which mariners, after a long absence, greet the sight of their national flag in some distant port; and this delight I now experienced. It seemed like a glimpse of home, and reminded us that we were approaching not only civilization, but countrymen and friends. We now descended from the plateau to the valley of the Rio Grande, after which a ride of half an hour brought us to the military post at El Paso del Norte. Here we were kindly received by the Commandant, Major Van Horne, who assigned such quarters for us all as the place afforded.

Our journey from San Antonio had taken us thirty-three days, six of which we were detained on the way, making twenty-seven travelling days in all. I make my estimates from our rate of travelling, and from the distances on the map of Ford and Neighbors; but adopt the measurements made by Major Bryan with a viameter. Some of his first camps differed from mine, though our trails could not have been far apart between Fredericksburg and the head of the Concho River, where we both struck the Emigrant Road, which we followed to the Rio Grande.

The distance by Major Bryan's table from San Antonio to Isleta on the Rio Grande is 638·02 miles. It is called 28 miles from the Waco Tanks to El Paso, which would make the distance from San Antonio to that place 635 miles. The distance by the southern route, followed by the main body of the Commission, is 673 miles.

A few general remarks on the country we have passed over seem proper here. From Indianola to San Antonio there is an excellent road, with wood, water, and grass in abundance, except between Indianola and Victoria, where there is but little wood. Parties should therefore provide themselves with fuel before starting. The soil here is admirably adapted to agriculture. From San Antonio to Fredericksburg, the road is very stony a portion of the way, the remainder good. The soil is excellent. Wood, water, and grass are always found at convenient distances, and in abundance. The soil continues of a good quality until the San Saba is reached; from that river to the north fork of Brady's Creek it is not so good. The grass is generally light to the latter place, with less wood and water, though enough for parties traveling. We now begin to get on the great table-land of Texas, where there is little rain and a poor soil. Several small streams emptying into the Colorado or the Concho here intersect the road, on the immediate banks of which there are a few trees. But the intermediate country is destitute of timber, save a very few small oaks or mezquit. The grass too is poor, except near the water courses. On leaving the head waters of the Concho, nature assumes a new aspect. Here trees and shrubs disappear, except the thorny chapporal of the deserts; the water courses all cease, nor does any stream intervene until the Rio Grande is reached, 350 miles distant, except the muddy Pecos, which, rising in the Rocky Mountains near Santa Fé, crosses the great desert plain west of the Llano Estacado, or Staked Plain. From the Rio Grande to the waters of

the Pacific, pursuing a westerly course along the 32d parallel, near El Paso del Norte, there is no stream of a higher grade than a small creek. I know of none but the San Pedro and the Santa Cruz, the latter but a rivulet losing itself in the sands near the Gila, the other but a diminutive stream scarcely reaching that river. At the head waters of the Concho, therefore, begins that great desert region, which, with no interruption save a limited valley or bottom land along the Rio Grande, and lesser ones near the small courses mentioned, extends over a district embracing sixteen degrees of longitude, or about a thousand miles, and is wholly unfit for agriculture. It is a desolate barren waste, which can never be rendered useful for man or beast, save for a public highway. It is destitute of forests, except in the defiles and gorges of the higher mountains or on their summits. Along the valley of the Rio Grande, which is from one and a half to two miles in width, there grow large cotton wood trees and a few mezquit; but between this river and the north fork of Brady's Creek there is no timbered land.

The country is well adapted for a wagon road, and equally so for a railway, as all desert regions are, unless they are sandy. From Fredericksburg, all the way to the Rio Grande, there is a natural road, which as a whole is better than half the roads in the United States west of the Mississippi. Very little has been done to this road of nearly 600 miles to render it what it is; and a little labor where the streams are crossed, with a bridge across the Pecos, which could be constructed with great ease and at a small expense, would make the

whole of it equal to our best turnpikes. Here and there I would recommend a slight change in its direction; as for instance, near Kickapoo Creek, to avoid a rocky ridge; and some improvements might be made near Fredericksburg: but these are trifles. The most important consideration is water, without which this route never can be made available as a great public highway. There is little doubt that by digging, water may be found on the desert between the head of the Concho and the Pecos. At the depressions, called Mustang Ponds and Wild China Ponds, where, it appears, water has sometimes been seen, wells might easily be sunk and water be procured. Two watering places in this jornada of sixty-nine miles would be quite sufficient. On the western side of the Guadalupe Mountain there should be another watering place; but it is evident from the statements made by the party which had been so long encamped at the Salt Pond, that there exists several springs about the base of the mountain. Next come the Cornudos del Alamo and the Waco Mountains; where there are springs, but which, from their not being opened, soon dry up or disappear. These, being at proper distances for daily journeys, would be suitable places to sink wells, or, which would be better, to open the springs already known.

If it should be determined to make a great highway through Texas to El Paso, and thence to California, south of the Gila, neither of the present routes to El Paso should be adopted until a more complete exploration has been made. I was told at El Paso, by Mexicans who had traversed the district east of that

town, that water could be found in the mountains that separate El Paso from the Pecos, between the routes now taken. Should such be the case, and no impediment exist, at least fifty miles of travel might be saved; and if water is not now found, it may as easily be obtained, by sinking wells, as on the northern route. The whole country, after the table-land north of San Antonio is reached, is well adapted to a wagon road or a railway; and I doubt whether any district of the same extent east of the Mississippi would require fewer embankments and excavations than across the table-land of Texas.

SECOND DIVISION.

EL PASO TO THE COPPER MINES.

CHAPTER VII.

EVENTS AT EL PASO.

Losses of Animals—High price of provisions at El Paso—Excursion up the river—Entertainment given to the officers of the Commission by the civil authorities—The Bishop of Durango—Pueblo Indians—Meeting with General Condé, and commencement of the labors of the Joint Commission—Arrival and disposition of the main body of the United States Commission—Arrival of ox-train, and death of U. D. Wakeman—Departure of military escort for the Copper Mines—American desperadoes in New Mexico—Death of E. C. Clarke—Trial and execution of Wade, Craig, and Butler—Trial and execution of Young—Dinner and ball given under difficulties—Excursion to the Sierra Waco—Indian pictures at the Waco Tanks—Initial point agreed upon, and survey in its vicinity commenced—Dépôt established at the Copper Mines—Dr. Webb's report on the same.

ON reaching El Paso, I feared that the ten mules sent out by Major Van Horne to my assistance would be insufficient, as so many of our animals had suddenly given out when I left the train. On making my fears known to Mr. Magoffin, an American merchant here, he generously ordered four of his own men to take ten of his best mules and set off immediately to aid the train in getting in; and, in consequence, it arrived in safety five days after.

I have not mentioned the loss of animals, save on two or three occasions, although several other instances of this misfortune occurred to us. The fine horse which was bitten by a rattlesnake died a few days after. On the last day, two horses which had been led for several days lay down, and refused to go further. They were left within ten miles of our journey's end. I sent a man back immediately on my arrival with corn and water; but he was too late, both were already dead. But though the losses of this kind were few on the march, they were great after we got in. There were no sheds or barns in which the animals could be placed to protect them from the cold winds which prevailed at this season of the year; and the grass was very poor. I procured corn for them at once, and sent them to a grove a few miles above the town, where they would be better protected than if running at large over the open plain. But about a week after my arrival a severe norther came on, bringing with it the cold blasts from the snowy mountains, which had such an effect upon the poor creatures, that twelve or fourteen mules and horses perished.

Provisions of all kinds were exceedingly high at this time: flour, thirty-two dollars a barrel; pork, sugar, and coffee, fifty cents a pound; and other articles in proportion. Corn too, was selling at eight dollars a fanega of two and five-eighths bushels. The arrival of my party rather tended to increase prices; for the population was so limited, that the addition of forty men and sixty animals, with a knowledge that a large train with the main body of the Commission and its escort would soon arrive, led the owners of such pro-

perty to keep up the rates. The Government, however, had given me authority, in cases of necessity, to call upon the United States Commissaries of Subsistence for provisions; and hence the immediate wants of my party were provided for by the officers of this post. Corn and fodder for the animals, however, had to be purchased at the market prices.

General Garcia Condé, the Mexican Commissioner, had not yet reached El Paso, though intelligence had been received here that he was at the city of Chihuahua; word was therefore sent to him at once, that the United States Commission had arrived.

In order to make myself familiar with the country in the vicinity of El Paso before the Commission should enter upon its duties, I made an excursion, in which I was accompanied by Major Van Horne and several gentlemen of my party, over the mountain ridge which crosses the Rio Grande a few miles above the town. We passed up on the Mexican side of the river, crossing over to the American side at White's Ranch, a course which we followed in returning. About a mile above the town is a fall in the river, where a dam has been constructed, and the water raised about ten feet, for the purpose of irrigating the valley below. There are two grist mills here, one on the Mexican, the other on the American side of the river. For the distance of eight miles, as it is called, above El Paso, there is no bottom land, the river breaking its way through the mountains the whole distance. The range on the eastern side, called the El Paso Mountains, rises to a height of about one thousand five hundred feet. It is a continuation of the Sierra de los

Organos, or Organ Mountains, and approaches within two miles of the river, where it drops off into spurs of about two hundred feet in height. These hills or spurs cross the Rio Grande, and unite with another range eight or ten miles to the west. It is through these spurs or lesser range of limestone hills that the river has forced its way.

November 9th. In company with the officers of the Boundary Commission, I attended to-day a public dinner given to us by the civil authorities of El Paso. The officers of the United States army, stationed opposite the town, were among the guests, as well as the principal citizens of the place. The dinner was served up in true Mexican style, with a great variety of dishes; and, with the exception of vegetables, of which there is a great deficiency in the country, the entertainment would have been creditable even in our Atlantic cities. The wine drank on the occasion was Champagne, claret, and *vino del pais*, or wine of the country. The latter was an excellent article, the best I ever found at El Paso. When the cloth was removed, toasts were drunk, and some songs sung. The best feeling existed throughout the evening, and the affair terminated to the satisfaction of all present.

November 23d. Accompanied by Major Van Horne and several gentlemen of the Commission, I went to pay my respects to the Bishop of Durango, then on his return from a visit to New Mexico. He was a venerable man of about seventy years, with a countenance exhibiting great benevolence and intelligence. I found him affable and courteous in his manner, fond of conversation, and manifesting a deep interest in the

welfare of his people in New Mexico and the northern states of Old Mexico, all of which are comprised in his diocese. From the city of Durango, where he resides, he had been about fifteen hundred miles, to the north, visiting his churches in the most extreme points of New Mexico. He was accompanied by Dr. Rubio, his secretary. In his journey north of El Paso, when he entered the territories of the United States, the Bishop received every attention from the civil and military authorities, and was furnished with escorts by the latter through such portions of the country as could not be traversed in safety without. His gratitude for this kindness was warmly expressed. He made particular inquiries about the United States Boundary Commission, the duties intrusted to it, the character of the country it would have to explore, the Indian tribes, etc., etc.

The next day we rode over to El Paso, to attend mass, and hear a discourse from the Bishop. His congregation was large and attentive. Crowds of well dressed persons were assembled around the exterior of the church, unable to gain admission. This was a fine occasion to see the people, as there was a general turn out. The women all wore dark *rebosos*, or scarfs, around their heads and shoulders, and in general were gaily dressed. The more genteel appeared in black. Much attention is paid to costume, and the *señoritas* fully appreciate the effect of particular colors on the complexion; hence, one seldom sees in Mexico those delicate lilacs, pinks, and sky-blues which are so much worn by, and are so becoming to, the fair Anglo-Saxon. Bright colors are mostly worn, which set off the

Mexican brunettes to great advantage. After church we were invited by Don Guadalupe Miranda to partake of refreshments at his house. Grapes, apples, and pears were served up, together with El Paso wine. The grapes were as fresh and plump as when gathered. In the afternoon, the Bishop, Dr. Rubio, and Padre Ortiz, accompanied by several of their friends, called on me. I served up a collation of such things as my commissariat could furnish; though the *carte* was rather limited, as the train which contained our provisions had not yet arrived.

November 25th. Crossed the river on horseback to make some purchases in the town; and while there, met a party of Pueblo Indians, who were just entering. The men were chiefly dressed after the manner of the lower class of Mexicans. They wore short jackets, decorated with innumerable bell-buttons, and dark pantaloons with similar buttons, open at the outside from the hip to the ankle, with large white trowsers beneath. The women all wore short black dresses, reaching just below the knees, with a thin white muslin mantle thrown over their shoulders. A bright red silk shawl was tied around their waists, and they had bunches or bows of gay ribbons in their hair. All their faces were painted alike, with a spot of vermilion on each cheek, surrounded by a border of small white dots. The women held in each hand a large turkey feather, which they moved up and down, keeping time with their music. The men carried flint muskets, and one of them a drum, on which he was beating constantly. All joined in singing a monotonous tune, and, when they reached the church, stopped and commenced

dancing. They formed lines similar to those made for a contra dance by us, passing through a variety of figures and marchings. From the perfect regularity with which they went through these figures, they must have followed some established forms. The Indians belong to the old Piro tribe, and dwell in the same village of Sinecu which their ancestors occupied two centuries ago. They are now dwindled to about eighty souls; and but few of these are pure stock. Their language is retained by them, though less used than the Spanish. Another generation will probably extinguish the language; though the mixed race may long occupy their present ground, and retain the manners and customs of their forefathers.

November 28th. About 8 o'clock in the evening, Captain Barry and Mr. C. J. Sheldon arrived from our large train, which they left about two hundred miles behind, having been sent in advance to procure mules and forage. They had, like ourselves, experienced very severe weather; and their animals were so much reduced, that it had been feared they could not reach the settlements. They also informed me that the wagons and carts drawn by oxen, being unable to keep up with the mule train, had been left behind some weeks earlier, with all the provisions not necessary to bring the party with the mule train in. I regretted exceedingly to hear this news, as the military escort under Colonel Craig was with Colonel McClellan and the mule train, while the ox train, containing much valuable property in addition to the provisions, was in charge of only a wagon-master and a few men. Word was sent me by the Commissary that it would be necessary

to procure at once some provisions, to be ready on the arrival of the mule train; as the officer in command had not taken enough to bring them through, and he had been compelled to call upon Colonel Craig for a supply already. By the gentleman alluded to, I received a mail with important dispatches from the government, apprising me that Colonel McClellan, the chief astronomer of the Commission, was removed, and that Colonel J. D. Graham would be appointed to fill his place.

I made arrangements at once, with the United States Commissary of Subsistence at El Paso, to furnish provisions for the expected party, which were placed at San Eleazario, a town about twenty-five miles below, where quarters could be procured for them during the cold weather, or until they entered the field for active duty. The flour being of a very fair quality made at El Paso, I contracted for a supply, at ten and a half cents a pound, about twenty dollars a barrel. For corn, the Quarter-master was compelled to pay six dollars and a half a fanega, or about two dollars and a half a bushel.

December 1st. General Pedro Garcia Condé, with the other officers of the Mexican Commission, reached El Paso to-day.

December 2d. Received a note this morning from General Condé, announcing his presence, and his readiness to carry out the agreement entered into by the Joint Commission in California, on the 15th February last. I replied immediately, congratulating him on his safe arrival, and stated that I would do myself the honor of calling upon him at 12 o'clock.

At the appointed time I crossed the river, accom-

panied by Major Van Horne, Lieutenant Wilkins, Dr. Webb, Secretary of the Commission, and Mr. J. C. Cremony, Interpreter. We met General Condé, with his officers and engineers; also Colonel Langberg, a Swedish officer in the Mexican army, who was then in command of a body of troops just arrived from Chihuahua, for the protection of the frontier against the Indians. The interview was an agreeable one, the engineers connected with the Mexican Commission being gentlemen of education, and graduates of the Military School at Chepultepec. The Interpreter was Don Felipe de Iturbide, the younger son of the late Emperor.

I expressed a desire to General Condé to proceed to business as soon as possible, as we had a large number of engineers and other scientific men in our party, who were anxious to enter their field of labor. The General acquiesced in my wishes, and said he would meet me to-morrow at my quarters.

December 3d. General Condé, with his son Don Augustin Condé, who acts as his Secretary, and Don Felipe de Iturbide, called by appointment at 10 o'clock, A. M., when the first meeting of the Joint Commission to run and mark the boundary between the United States and the Republic of Mexico, under the treaty of Guadalupe Hidalgo, took place. Two hours and a half were spent at this first session, when we adjourned to meet at the quarters of General Condé the following day.

The meetings of the Joint Commission were held twice a week after this, though there were interruptions at times from the ice in the river, which prevented parties from crossing. Great difficulties were pre-

sented, in consequence of errors in the map to which the Commissioners were strictly confined; so that I feared we should not be able to agree upon the southern boundary of New Mexico. This is a line connecting the Rio del Norte with the Gila. According to the treaty map (which is Disturnell's Map of Mexico, of 1847), the point where the Rio Grande or Del Norte, strikes the southern boundary of New Mexico, is in latitude $32^{\circ} 22'$ north. Thence it runs westward three degrees to $107^{\circ} 40'$ longitude west from Greenwich.

On the 9th of December, the main body of the Commission, which I left at San Antonio, reached San Eleazario, and went into quarters at that place and at Socorro, a town six miles north of it. It was impossible to find quarters for all at either place. My official duties required me at El Paso, where about a dozen officers and laborers were quartered. Quarter-master Myer, with the mules, wagons, etc., and Mr. George F. Bartlett, Commissary, with the subsistence stores, were established at Socorro, while Lieutenant A. W. Whipple, who (by order of the Secretary of the Interior) had been appointed Chief Astronomer, *ad interim*, had set up his Astronomical Observatory at San Eleazario. The officers, mechanics, laborers, etc., were divided between the two places where their services were most required.

January 8th. There was quite an excitement to-day, in consequence of a theft by the Indians of forty mules belonging to Mr. Magoffin, while they were grazing in charge of four men on the plateau, three miles from my quarters (then at Mr. Magoffin's

house), and about the same distance from the military post. A party of the Commission immediately volunteered to go in pursuit. The best horses to be had were procured as soon as possible; and each man, taking a rifle, a six-shooter, and a blanket, was in the saddle within two hours after the news of the robbery reached us. They soon fell on the robbers' trail, which they followed for some distance towards the Waco Mountain, when it turned north-west. They continued on until the trail struck the Santa Fé road, when they gave up the pursuit and returned the next day.

January 9th. The ox train left behind by Colonel McClellan arrived at San Eleazario to-day, having suffered severe hardships on the route. It left San Antonio, as I have before stated, with the main body of the Commission, on the 14th of October, and had therefore been nearly three months on the way. On the 8th of December a sad event took place, which resulted in the death of Mr. U. B. Wakeman, the wagon-master in charge of the train. The circumstances as related to me are as follows: With the train there was a Captain Dobbins, formerly of the United States Army, who had been cashiered for some misconduct. This individual, being a personal friend of Colonel McClellan, induced the latter to give him employment as a kind of guide and hunter for his party; to which arrangement, being unacquainted with the man's history and character, I consented. On leaving the ox train behind, the Colonel directed Dobbins to remain with it. On the day alluded to, Mr. Wakeman was occupied in hunting up the oxen, and did not return till late at night, when he found some parties

gambling. He ordered it to be stopped, and Dobbins refused to obey. High words arose, when Dobbins rushed from his tent and discharged his revolver twice at Mr. Wakeman, both balls taking effect. He died of his wounds ten days after.

On the arrival of the train, Captain Dobbins surrendered himself to the authorities, underwent an examination, and was acquitted on the testimony of some of the teamsters, who alleged that he had acted in self-defence.*

January 13th. Rode to *Doña Ana*, a small town on the eastern branch of the Rio Grande, where we have a military post, under the command of Major Shepard. The distance, which is 56 miles, was made between 9 o'clock, A. M., and 6 o'clock, P. M., in my carriage, drawn by four mules. The only intermediate town is *Las Cruces*, eight miles from *Doña Ana*.

As Colonel Craig was here with the escort of the Commission, which he was about to march to the Copper Mines on account of the advantages which he believed that region offered as a camping-place, I requested Dr. Webb, Mr. George Thurber, and Mr. Cremony to avail themselves of the protection of the escort, and examine that district of country, and the old town there, as to their capabilities with reference to water, wood, grass, buildings, etc. I transferred my carriage to them, understanding that a good road

* I derive my information from documents sent to me, which are printed in Senate Document No. 119, 32d Congress, 1st session, pages 496, 497, and 498. The particulars of the examination which took place at San Eleazario, were never furnished me, and I only know from hearsay the grounds on which Captain Dobbins was acquitted.

would be found most of the way. In addition to these, a train of twenty large wagons, belonging to S. Hart, Esq., loaded with corn and provisions for the escort, was going at the same time, and would open a road wherever it was necessary. On the 16th, I set out on my return to El Paso, and arrived there the following day.

During my absence, the Indians made another descent upon the inclosure near Mr. Magoffin's house in which he kept his mules, and stole thirty. Several men were sleeping in the wagons within the corral at the same time; yet so quietly was the robbery committed, that the loss was not discovered till morning.

When the Boundary Commission landed on the shores of Texas in August, 1850, it was necessary to employ about fifty teamsters, and many laborers, cooks, etc.; and the Quarter-master, whose duty it was to engage the former, was obliged to take such as offered themselves, giving the preference, of course, to such as could produce testimonials of good character. He found many who had been in the government employ, who had good testimonials; but there were others who possessed no such credentials. Hence several men who afterwards turned out to be worthless characters obtained menial places in the Commission. On the arrival of the several parties at El Paso and San Eleazario, it was necessary to discharge a large number, chiefly of the teamsters; and such as were found to be of bad habits or vicious disposition were paid off and discharged. There were also many very good men, who, having families at San Antonio, engaged only for the trip, and who, on being paid off, returned immediately to that place.

Other trains which had preceded us, and some that arrived about the same time that we did from New Mexico, including emigrant trains bound for California, were disbanded here, leaving numbers of the outcasts of society referred to, with little means of support. But means or money were not of much consequence to these people: for their habits of gambling were such, that those who had money soon got rid of it.

The discharging of so many worthless and vagabond men at Socorro, where the trains usually made it their rendezvous, threw upon the peaceful inhabitants of that place a set of ruffians, who, by daily increase of numbers, had become so formidable, that the life of no one was considered safe beyond the walls of his own house. And even within them, there was no security; for several of these men had actually forced themselves upon the occupants, and compelled them to give them a home. Unused to such interlopers, and unable to obtain redress, several Mexican families abandoned their dwellings, and sought refuge on the opposite side of the river, or removed to other settlements.

The first check given to this band of gamblers, horse thieves, and murderers, was the arrival of the United States Boundary Commission at Socorro. The presence of a body of well armed, well disposed, and spirited young men, tended to make these ruffians more circumspect for a time; but as the former were gradually drafted off, to enter upon the duties connected with the Survey, the latter became more overbearing and insolent in their conduct. Houses were opened for the indulgence of every wicked passion; and each midnight hour heralded new violent and often bloody scenes

for the fast filling record of crime. The peaceable Mexicans hastened to pack their little store of worldly wealth, and, with their wives and children, fled from the rapidly depopulating village. Every new outrage escaping the notice of those in authority gave additional boldness to the desperate gang surrounding us. None dared stir from home without being doubly armed, and prepared to use their weapons at a moment's warning; for the turning of a corner might bring one to the muzzles of a dozen pistols.

After several murders had been committed, and horror and dismay filled the breasts of the orderly part of the community, it was resolved to ask for assistance from the military post at San Eleazario, six miles distant. A note was written by the Quartermaster and the engineers, giving a history of what had occurred, and representing the alarming condition of things at the time. The messenger returned with an answer from the commanding officer, declining to furnish any assistance, on the ground that the application should first be made to the civil authorities.*

In the evening, a dancing party was given in the place, an almost nightly amusement in all Mexican and

* I am indebted to a gentleman of high standing connected with the Commission for the particulars of the death of Mr. Clarke, and the trial and execution of his murderers. He was stationed at Socorro when the events transpired, and was often brought in contact with the principal actors in them. He attended the trial of all, and took down the confession of Young, the man last executed. From others equally conspicuous, and who were also residents there at the time, I have received similar accounts. I do not think, therefore, there is any exaggeration in the narrative, but believe that what is stated is strictly true.

frontier towns, which, as usual, was attended by quite a mixed company. As these dancing parties, called "fandangos," are open to all, the vagabonds prowling about at the time were numerous, and made themselves conspicuous by their conduct. Pistols were fired over the heads of the females, who, in their alarm, attempted to escape from the room; but this was prevented by ruffians stationed at the door. By this time there was a great excitement within, and several desperadoes commenced using their bowie-knives. Mr. Edward C. Clarke, the Assistant Quarter-master of the Commission, who was present on the occasion, was the first person upon whom the ruffians attempted to satiate their thirst for blood. Four attacked him with their knives, and he fell near the door dreadfully wounded. He was immediately taken to the quarters of Dr. Bigelow, the surgeon of the Commission, who, on examination, found he had received nine or ten deep wounds, inflicted with bowie-knives, in his breast and abdomen. Another man named Gates was also wounded by a pistol-shot in the leg. Dr. Bigelow at once pronounced the wounds of Mr. Clarke mortal, and he died the following morning.

When the startling announcement was made, that an officer of the Commission had been foully murdered by the wretches whose lawlessness had before gone too long unchecked, the question arose, what was to be done? Aid from the military had been refused. The alcalde of the village, a weak and sickly imbecile, had transferred his authority to another even more timid and less reliable than himself; yet this person

was invested with the powers of a justice of the peace, by authority of a commission from the State of Texas, and constituted the entire civil authority at Socorro.

In this alarming condition of affairs, the members of the Boundary Commission present were compelled to move in the matter, and resolve upon some plan to protect not only their own lives and property, but also those of the trembling and dismayed population about them. Messengers were immediately sent to San Eleazario, for assistance from the main body of the Commission, there engaged in various duties. The call was promptly responded to; and in about three hours a party of Mexicans and Americans were collected together. They hastily armed themselves, and, joined by members of the Commission, proceeded at once to Socorro, where many of the citizens were already assembled awaiting them. The force was now divided into several parties, and a systematic search at once commenced to ferret out the murderers. Every house was examined, and eight or nine persons arrested; but a man named Young, who had been most conspicuous in the affray, was not to be found, having, it was said, escaped from the village in the morning. The prisoners were immediately conducted by an armed guard to the house of Justice Berthold, where a court was instituted to suit the emergencies of the case. Juries were summoned and sworn, a prosecuting attorney named, and counsel for the defence offered to the prisoners, which they declined, treating the offer as a jest, and making vulgar and obscene remarks upon their position. Nevertheless, an individual tendered his services for the defence, and occa-

sionally cross-questioned the witnesses. The prisoners were evidently under the impression that nothing would be done, believing that, by the mutual understanding between them, they could easily swear themselves out of the difficulty. The examinations were conducted with propriety, and the prisoners made to keep silence by the resolute demeanor of the citizens present.

In selecting the jury, six were taken from the Mexican citizens of Socorro, and six from the Boundary Commission, as there were no other Americans in the place. The presiding magistrate, Justice, Berthold, was a highly respectable citizen, long resident there, of French origin.

It is doubtful whether in the whole history of trial by jury a more remarkable scene than the one here presented was ever exhibited. The trial took place in one of the adobe or mud-built houses peculiar to the country, which was dimly lighted from a single small window. Scarcely an individual was present who had not the appearance and garb of men who spend their lives on the frontier, far from civilization and its softening influences. Surrounded as we had been, and now were, by hostile Indians, and constantly mingling with half civilized and renegade men, it was necessary to go constantly armed. No one ventured half a mile from home without first putting on his pistols; and many carried them constantly about them, even when within their own domicils. But, on the present occasion, circumstances rendered it necessary for safety, as well as for the purpose of warning the desperate gang who were now about to have their deserts, that all should

be doubly armed. In the court room, therefore, where one of the most solemn scenes of human experience was enacting, all were armed save the prisoners. There sat the judge, with a pistol lying on the table before him; the clerks and attorneys wore revolvers at their sides; and the jurors were either armed with similar weapons, or carried with them the unerring rifle. The members of the Commission and citizens, who were either guarding the prisoners or protecting the court, carried by their sides a revolver, a rifle, or a fowling-piece, thus presenting a scene more characteristic of feudal times than of the nineteenth century. The fair but sunburnt complexion of the American portion of the jury, with their weapons resting against their shoulders, and pipes in their mouths, presented a striking contrast to the swarthy features of the Mexicans, muffled in checkered *serapes*, holding their broad-brimmed glazed hats in their hands, and delicate cigarritos in their lips. The reckless, unconcerned appearance of the prisoners, whose unshaven faces and dishevelled hair gave them the appearance of Italian bandits rather than of Americans or Englishmen; the grave and determined bearing of the bench; the varied costume and expression of the spectators and members of the Commission, clad in *serapes*, blankets, or overcoats, with their different weapons, and generally with long beards, made altogether one of the most remarkable groups which ever graced a court room.

Two days were occupied in the examination and trial: for one immediately followed the other. In the mean time, a military guard of ten men had been promptly sent to our aid by Major Van Horne, the

commanding officer at El Paso, on my requisition: so that the open threats which had been made by the friends of the prisoners during the first day of the trial, were no longer heard; for they now saw that the strong arm of the law would triumph.

The second day, a member of the Commission who manifested a deep interest in the prisoners, was requested by one of them to act as his counsel; but his efforts to prove an alibi, to impeach the testimony of some of the witnesses, and to establish the previous good character of the defendant, proved utterly futile. The prisoners were then heard in their own defence; but they could advance nothing beyond the mere assertion of their innocence. At the close of the testimony, an attempt was made by one of the friends of the prisoners to postpone the trial, for the purpose, as he stated, of obtaining counsel and evidence from El Paso. But the court had been apprised of the existence of a plot for attempting a rescue that night, and accordingly the request was refused.

The evidence being closed, a few remarks were now made by the prosecuting attorney, followed by the charge of the Judge, when the case was given to the Jury. In a short time they returned into court with a verdict of guilty, against William Craig, Marcus Butler, and John Wade; upon whom the Judge then pronounced sentence of death.

The prisoners were now escorted to the little plaza or open square in front of the village church; where the priest met them, to give such consolation as his holy office would afford. But their conduct, notwithstanding the desire on the part of all to afford them

every comfort their position was susceptible of, continued reckless and indifferent, even to the last moment. Butler alone was affected. He wept bitterly, and excited much sympathy by his youthful appearance, being but 21 years of age. His companions begged him "not to cry, as he could die but once!"

The sun was setting when they arrived at the place of execution. The assembled spectators formed a guard around a small alamo, or poplar tree, which had been selected for the gallows. It was fast growing dark, and the busy movements of a large number of the associates of the condemned, dividing and collecting again in small bodies at different points around and outside of the party, and then approaching nearer to the centre, proved that an attack was meditated, if the slightest opportunity should be given. But the sentence of the law was carried into effect.

The entire proceedings were intensely interesting, and the scene of a character which none present desired ever again to witness. The calm but determined citizens on the one side, and the daring companions of the condemned wretches on the other, remained throughout keenly on the watch: the first for the protection of life, and the support of good order in the community, the other with the malicious eyes of disappointed and infuriated demons, who, to rescue their companions, would have been willing to sacrifice a hundred additional lives.

All three of the criminals had been connected with the Boundary Commission. Wade was an Englishman, and had driven one of the teams in my small party. He was found to be a desperate villain, and I took the

first opportunity to discharge him on my arrival at El Paso. Craig was a cook in the main body of the Commission, and a Scotchman by birth. Butler was an American. He joined the train under Col. McClellan, after it had left San Antonio, in some menial capacity, and was discharged on arriving at Socorro. He was accused of having murdered a Mexican near Eagle Pass, and was fleeing when he met the train of the Commission.

Socorro now resumed its previous quiet and good order; for the authorities had directed all persons who were unconnected with the Commission, and were without any employment, to leave the place within twenty-four hours. This, however, was hardly necessary: for the guilty and vagabond throng had already begun to depart, and before the close of another day all had left. But there was one other, and he the principal actor in all the scenes I have related, who was yet to be apprehended and made to pay the penalty of his great crimes, before the demands of justice were answered.

Four hundred dollars were subscribed by the members of the Commission, and offered as a reward for the apprehension of Alexander Young, the ring-leader of the gang of desperadoes, and his delivery at Socorro. Volunteer parties set out in all directions, tempted by the prospect of gaining the large sum offered, and at length word was brought that he had been arrested at Guadalupe. Thus another unpleasant duty immediately presented itself; but it was impossible to avoid it.

The prisoner arrived in the evening, and was placed

in confinement, well chained and guarded. During the night, he was visited in jail. It was observed that the careless, dogged look had left his eye, and was replaced by a supplicating glance that told plainly of a change within. He was anxious to know if either of the three who had been executed had made a confession, and said he had given up all hopes of life. Being asked if he wished to write to any one, he answered that he would like to have a letter written to his mother, who had not heard from him for six years past. The letter was written, and the prisoner appeared much affected. He confessed the truth of the charges against him, criminating clearly, and to a still greater extent, the three who were hung first, besides many others.

At 10 o'clock the following morning, February 12th, the court again met, and a jury was empanelled. At the opening of the court, a letter of the prisoner, containing his confession, was read publicly, then signed by himself, and witnessed by certain members of the court and other individuals present.

With the testimony already before the court, the jury could have brought in an immediate verdict: but it was deemed advisable to present other evidence, to show still further the unmistakable guilt of every one who had been punished; especially as one or two persons, who passed for honest and honorable men, were interested in upholding the character of their associates. The prisoner was found guilty, and sentenced to be hanged. At 4 o'clock, P. M., of the same day, he was taken to the church; where, with penitent lips, and on bended knees, he made his final confession, received the blessing of the priest, and from thence

was taken to the spot where he was to be executed. His last request for himself was that he might be buried as respectably as the circumstances of his case would admit. While standing under the tree, with the rope around his neck, he begged to be allowed to say a few words to those around. He exhorted those both younger and older than himself, to take warning from his example. They could see what gambling, swearing, drinking, and an ungovernable temper, with evil associates, had brought him to. He had run away from home at the age of fourteen, and would never see that home again. With other remarks of like character, he concluded. At half past 4 o'clock, P. M., the law was carried into effect, using the same tree where the three others were executed. Young was a native of one of the western States. He had been several years on the Mexican frontier, and was well known in Texas as a most desperate character.

The well-merited punishment of these four men was highly applauded and justified by both the civil and military authorities of the frontier. Such an example had been needed for some time. The vicinity was now rid of gangs of worthless desperadoes; and as a Mexican citizen of the peaceable old town of Socorro remarked, "We can now sit in the evening at the doors of our houses, and not be obliged, as before, to retire, with the sunlight, fix bolts and bars, and huddle into corners with fear and trembling."

February 22d. In return for the civilities extended to me and the officers of the Commission by the authorities of El Paso, I gave a dinner to the Mexican Commission and the public authorities, which came off yester-

day; several officers of the United States army stationed here were also among the guests. In the evening, I invited the principal citizens of the town to a ball and supper, and was honored by the attendance of about fifty ladies. Mr. Magoffin, whose house, in which I had my quarters, was the most spacious on the river, threw the whole open for the occasion, giving me thereby ample accommodations for the large party which had assembled. But as the greater portion of the company lived on the opposite bank of the river, it was no easy matter to get them together. I therefore sent my carriage, and others that were kindly furnished me, for my guests; and as it was between three and four miles from my quarters to El Paso, including the fording of the Rio Grande, it was necessary to begin fetching them at the unfashionable hour of four o'clock in the afternoon. The river had to be forded by daylight, in consequence of the frequent changes in the channel and the bars.*

I was quite at a loss for furniture and fittings for my entertainment. Chairs were borrowed of the

* Accidents often happened in fording the river at night. But a short time previous a party of Americans, with ladies, in attempting to cross when it was quite dark, missed their way, and nearly perished. Their carriage remained more than an hour filled with water in the middle of the river. They could not land except at the regular fording place, as the banks were steep: and they were only rescued by making themselves heard by people near the shore. I once got into a similar dilemma myself. I and my companions had to get out of the carriage windows and stand upon the tops of the wheels, while the driver was sent for assistance. Several Mexicans came, and, taking one on each of their backs, carried us safely on shore, though a little the worse for our immersion.

neighbors far and near ; but even with these I had not half seats enough for the company. This, however, proved no great inconvenience ; for the Mexican ladies, preferring to sit *à la Turk*, formed a double row around the dancing room. The señoras occupied the trunks, chairs, and settees, and the señoritas the carpet in front. My friends in the vicinity kindly furnished me with tables, lamps, dishes, and such other necessaries as the occasion required. To light the large hall properly most tried my ingenuity ; but this difficulty was overcome by means of a new-fashioned chandelier improvised by one of our gentlemen for the occasion. Sockets for the candles were first required ; and these were constructed out of the tin boxes in which sardines had been preserved. Next, a hoop from a pork barrel was divested of its bark, and wrapped around with binding of a bright scarlet hue, which had been brought out to decorate the heads of the fair Apaches and Comanches, as well as the tails and manes of their animals. Into this hoop or frame the tin sockets were fixed, and the whole supported by several loops of the same elegant material fastened to a common centre. Such was the style and origin of our chandeliers, with their dozen burners each ; four of which, suspended from the ceiling, shed such a ray of light upon the festal hall, as rendered the charms of the fair señoritas doubly captivating. The evening passed off pleasantly ; and all danger of crossing the river was obviated by the company remaining till eight o'clock the following morning. After treating all to a cup of coffee, the carriages and other vehicles were ordered up, and the company conducted safely to their homes.

March 8th. Major Shepard, commanding at Doña Ana, gave me information to-day that seven soldiers belonging to Colonel Craig's command, had deserted from our escort at the Copper Mines, and wished me to aid him in having them arrested and brought back. With this view, I rode over immediately to the quarters of General Condé, at El Paso, accompanied by Major Van Horne, to ask his co-operation. The General agreed to send a courier at once to the military commandant at Chihuahua, three hundred and twenty miles distant, requesting him to take such measures as would lead to the capture and restoration of the deserters, if they should be seen at any of the military posts on the frontier.

March 28th. Made up a little party of nine persons, besides a cook and servant, for an excursion to the Sierra Waco, about thirty miles distant, the last stopping place on our journey from San Antonio. It was so interesting a spot, and our stop there was so short, that I determined at the time to take an opportunity to revisit it, in order to make a more thorough examination. We left at eight o'clock, A. M., with my carriage and one wagon for camp equipage, cooking utensils, and provisions, all the gentlemen going on horseback or on mules. After a very tedious ride over a sandy road, we reached the tanks at four in the afternoon, and encamped near a natural cavern in the rocks, where we found excellent water. As this was a favorite place of resort for the Apaches, we did not feel safe until we had climbed the rocks which overhung our place of encampment, and searched for "Indian sign." We found many traces of visitors,

such as the marks of mules, on the very summit of the rock, but none recent. A party had evidently been there some time before us, which, for concealment, had taken their animals to the top of the rock in preference to leaving them below.

March 29th. The night had been cold, but to-day it was quite warm. Rambled over the great rocky mass to see what could be found of interest. Discovered several pools or tanks of clear and beautiful water, where it had collected from rains, or the melting of snows. The formation here is granite in place, rising from 100 to 150 feet above the surrounding plain, and covered with huge boulders piled up in every imaginary form. Along the sides and base these great boulders also lie; whence the inference seems natural that this rocky mass existed before the mountains in the vicinity were heaved up, as there are no boulders on the adjacent hills. As might be supposed in such a heap of gigantic boulders, there are many cavern-like recesses which seem to have been the abode of Indians. In many places, too, the rock projects or overhangs; and in others frightful chasms, as though rent asunder by some violent concussion, appear: all of which seem to have been known to the Indians, and in some instances long used by them as places of habitation. At one portion of the southern mass, nearly half a mile from the road, there is an overhanging rock extending for some distance, the whole surface of which is covered with rude paintings and sculptures, representing men, animals, birds, snakes, and fantastic figures. The colors used are black, red, white, and a brownish yellow. The sculptures are mere peckings with a

sharp instrument, just below the surface of the rock. On the shelving portion of the place in question are several circular holes in the solid granite from twelve to fifteen inches deep, which the Indians have made and used as mortars for pounding their corn in ; similar ones being found all over the country where the aborigines have had their habitations. There were other places where they had sharpened or ground down their arrows and spears. The accompanying engravings show the character of the figures, and the taste of the designers. Hundreds of similar ones are painted on the rocks at this place ; some of them, evidently of great

age, had been partly defaced to make room for more recent devices.

The overhanging rock beneath which we encamped seemed to have been a favorite place of resort for the Indians, as it is at the present day for all passing travellers. The recess formed by this rock is about fifteen

feet in length, by ten in width. Its entire surface is covered with paintings, one laid on over the other; so that it is difficult to make out those which belong to

the aborigines. I copied a portion of these figures, about which there can be no doubt as to the origin. They represent Indians with shields and bows, painted

with a brownish earth; horses with their riders; uncouth looking animals; and a huge rattlesnake. Similar devices cover the rock in every part, but are much defaced. Over these are figures of late travel-

lers and emigrants; who have taken this means to immortalize their names, and let posterity know that they were on their way to California. Near this overhanging rock is the largest and finest tank or pool of water to be found about here. It is only reached by clambering on the hands and knees fifteen or twenty

feet up a steep rock. Over it projects a gigantic boulder, which, resting on or wedged between other rocks, leaves a space of about four feet above the surface of the water. On the under side of this boulder are fantastic designs in red paint, which could only

have been made by persons lying on their backs in this cool and sheltered spot. One of these, a singular

geometric figure, I copied while resting in the same position secluded from the burning sun.

In a deep cleft in the rock, on the south side of the road which we followed for one hundred and fifty feet into the interior, were many bones of wild beasts. Near this the hills expand, forming an amphitheatre, which is celebrated from its being the place where the Apaches used formerly to hold their councils, and the scene of a contest between them and the Mexicans. The Indians had been committing some depredations and murders in the settlements, and, being pursued, were traced to the Waco Mountains. A party set off from El Paso, and surprised them in the narrow space or amphitheatre alluded to. The besieged retreated as far as possible; and finding no chance to escape, they built a wall across the entrance, which is about one hundred feet from one perpendicular mass of rock to the other. Here they were kept several days, when they were finally overcome, and all, to the number of a hundred and fifty, put to death.

In the afternoon we walked about two miles to the centre of the plain, which is bounded on the west by the great Waco Mountain, to some singular piles of rocks, which attracted our attention when passing through here in November, but were too far off the road for us to examine them at the time. At the distance of half a mile, they appear like the ruined walls of some great edifice; and when first discovered, all exclaimed, "Ruins!" On reaching them, we found them to be upheaved masses of reddish granite, blackened by the weather, so as to present, in their detached position in the plain, a strong resemblance

to ruined buildings. There were three groups of these singular rocks, a few rods apart, entirely disconnected, yet of the same general character. Their sides were perpendicular, like walls; their height about sixty feet. In the crevices at their base, and on their summits, grew a few bushes, which added to their picturesque appearance. But the most singular feature about them was, that many portions of their exterior surface were as smooth and as highly polished as though they had been submitted to some artificial process. It was probably the effect of exposure for ages to the weather. A similar appearance was observed at Thorne's Wells, in the *Cornudos del Alamo*, described on our journey from San Antonio. I took a sketch of these curious rocks, which will convey a better idea of their appearance.

March 30th. Accompanied by a party of six, well armed and mounted on horses and mules, I left camp early in the morning to visit the great Waco Mountain. The mountain was about five miles distant, and the route lay through the very pass which we traversed on a former occasion. Stopped at the place where we let the carriage down by ropes, of which I took a sketch. It was one of the most grand and picturesque scenes I had witnessed on our journey up. There was much more vegetation here now, and Mr. Thurber made many additions to his collection of plants. It is in the beds of these mountain torrents or ravines, that the flora presents the greatest variety. Although the plants found here are adapted by their nature to these parched and desert regions, they nevertheless appear to seek the more secluded spots, which afford them a little protection from the scorching

sun. Very few birds were descried. On reaching the great plain east of the mountain, we found several flocks of quails, of a different kind from those seen near the Rio Grande. These latter were all gray, like the northern quail; while those on the opposite side of the mountain are the blue or California quail, with a top-knot on its head. Got a few as specimens. As there was time enough to ascend to the top of the mountain, which is accessible from the east, we went around and struck the road which passes on the opposite side. This is the route taken by wagons. It is four or five miles longer; and although very hilly and tortuous, the narrow defile and perpendicular descent of the opposite route is avoided. Yet I would prefer the latter, even for loaded wagons, if the rock at the place referred to was cut away, a labor easily accomplished. After making a circuit of the mountain, and collecting some specimens of insects, reptiles, and plants, we reached our camp under the rock at 4 o'clock, P. M., well pleased with our little jaunt. The following day we returned to El Paso.

This was the only excursion I made from El Paso during the winter I was detained there, except visits on business to Doña Ana, Socorro, and San Eleazario. The Commission was as actively occupied as circumstances would permit. Lieutenant Whipple established an astronomical observatory at San Eleazario in December, and in February at Frontera, a rancho belonging to Mr. White, on the banks of the river, about eight miles above El Paso. This was intended for the permanent astronomical observatory and station, until the completion of the survey on this portion of the line.

As soon as the initial point of the boundary line, where the Rio Grande intersects the southern boundary of New Mexico, had been agreed upon by the Joint Commission, Lieutenant Whipple entered upon his duties as Chief Astronomer, to determine the position of the point on the Earth's surface, taking with him such assistants from the engineers and surveyors, etc., as he required. A second party, first under J. H. Prioleau, Esq., and subsequently under Thomas Thompson, Esq., entered the field in January, 1851, and commenced the survey of the Rio Grande at San Eleazario, which they continued up to the initial point at $32^{\circ} 22'$ north latitude. I also set a small party at work to make a survey of the town of El Paso and district adjacent, including the mountains, the pass, etc., embraced in a circuit of ten miles. These were all the parties I could place upon the survey, until the arrival of the chief astronomer, Brevet Lieutenant Colonel J. D. Graham, who had been appointed to that place in October last, but had not yet arrived. Consequently a large number of the engineers, with their assistants, could not be occupied; and this I greatly regretted, as the best season for field operations was now passing away.

I had given employment, for a few weeks, to John Bull, Esq., one of the first assistant engineers, with his party, in making a reconnoissance of the country between the Rio Grande and the Gila, via the Copper Mines of New Mexico, a district over part of which the boundary would run. Mr. Bull explored a new and more direct route from Doña Ana to the Copper Mines than that usually travelled; and examined the

country between them and the Gila, as well as that between them and the Mexican frontier post of Janos, about one hundred and fifty miles to the south, in the State of Chihuahua.

As it was necessary, in carrying the survey westward, to establish depots of provisions at accessible points, I sent Dr. Webb to the Copper Mines, as I have before stated, to see what its advantages were, with a view, too, of making it the head-quarters of the Commission during the progress of the survey in that quarter. After an absence of three weeks, that gentleman returned and made so favorable a report, that I instructed Quarter-master Myer to remove thither with the wagons, mules, camp equipage, etc., not needed by the parties in the field. I also instructed Mr. Henry Jacobs, acting Commissary, to deposit there at the same time all the subsistence and other stores in his department. I annex a brief extract from Dr. Webb's report:—

“The result at which I have arrived is, that the Copper Mines are preferable to any other spot in this section for the establishment of a depot of provisions and other stores, and for the location of the head-quarters of the Boundary Commission; being nearer the region which must be the field of labor the ensuing season; and as both property and person will be as secure and free from predatory attacks there as they can be elsewhere, provided a suitable military guard is furnished for their protection.

“The essentials of a good situation for the purposes had in contemplation present themselves at Santa Rita (the proper name of the copper mine region), in

greater number than can be found combined in any other spot within proper limits, of which we have cognizance. We find there a fine, airy, salubrious spot for dwellings, with some adobe houses (abandoned at the breaking up of the settlement on a threatened excursion of the Indians, in the fall of 1838), which, with little labor can be made tenantable; good timber, within a few miles, for building and other purposes, as also limestone and other useful materials for similar objects; a great plenty of wood near at hand for fuel; abundance of excellent grass for the animals, which will materially lessen the expense now necessarily incurred by furnishing them with grain; and a running stream, affording a supply of pure, fresh water, so essential to the comfort of both man and beast. The garrison, or fortress, that was erected for the protection of the former inhabitants of this place, is of ample dimensions to accommodate all the troops that will probably at any one time be stationed there, and can, without much difficulty, be put in good condition for the purpose; indeed, Colonel Craig is now actively engaged in directing its reparation.

“In addition, though secondary to these, I would observe, that the soil is good for agricultural and horticultural purposes; as is indicated by the remaining vestiges of the garden plats once cultivated, as well as by the rank, luxuriant growth of the peach-trees, still in bearing condition: and it is said that wild game, bears, deer, turkeys, etc., abound in the vicinity.

“The botanist, there is every reason for supposing, will, in that quarter, find a large and almost unexplored field, a suitable examination of which will

undoubtedly amply repay him for all the time and labor devoted to its examination; and the collection of specimens I made, even on this flying trip, convinces me that, by proper explorations and well directed research, a geologist might make discoveries, and with the industry and perseverance that a true love of the science will inspire, might make collections, both geological and mineralogical, that will prove of interest at home and abroad, and be of permanent value to the country.

“In conclusion, I would suggest, if the decision be to remove to the Copper Mines, it is important to have the provisions, etc., sent forward with as little delay as possible, inasmuch as it will be necessary to cross the Rio del Norte at San Diego; and this stream is liable to be so greatly and so suddenly swollen in the spring, that a very little delay might render it extremely difficult and dangerous, if not impracticable, to ford it with the teams, and thus make it necessary to build boats for the transportation of the property to the opposite side of the stream.”

I remained at El Paso until the 19th of April, unable to place any other parties on the line, greatly to the injury of the Commission and the interests of the Government. The whole astronomical force in the Commission was with the acting chief astronomer, Lieutenant Whipple; and I did not feel justified in sending parties to make the survey of either the Rio Grande, towards its mouth, or the Gila, until the chief astronomer, Colonel Graham, should arrive, with the other officers of the topographical corps, which had been detailed for duty on the Commission. Six

months had now elapsed since his appointment, and I had received no letters to explain the cause of this delay.

The astronomers of the two Commissions having determined the position of the initial point on the Rio Grande, as before stated, I departed for the place on the 19th of April, for the purpose of signing the documents necessary to establish that point, and of attending to such ceremonies as the importance of the event seemed to demand; after which I intended to proceed at once to the new head-quarters of the Commission, at *Santa Rita del Cobre*, or the Copper Mines.

CHAPTER VIII.

EL PASO AND VALLEY OF THE RIO GRANDE.

Early colonization of Mexico—Position of El Paso—Mode of irrigation—Agricultural productions—Vegetables—Fruits—Extensive culture of the grape—Wine—Brandy—The Rio Grande—Deficiency of water—Uncertainty of crops—Houses—How built—Oriental style preserved—Primitive mode of life—Flour mills—Degeneracy of people—Dress—Settlement on the American side—Coon's Rancho—Magoffinsville—Socorro—San Eleazario—Mountain chains—Plants—Current and sinuosity of the Rio Grande.

IN a work like the present, which professes to be a "personal narrative," it can hardly be expected that much space should be devoted to an historical or geographical description of the countries visited. Such digressions are important only as illustrations of the narrative, and must necessarily be limited. It was my intention to devote a chapter to these subjects, so far as they relate to New Mexico; but after looking over my materials, I find them so ample respecting the discovery and colonization of this country and the almost unexplored region between it and California, that the subject would fill half a volume if I gave it the attention it really deserved. There is no portion of the early history of this continent, whether it be that

of the first establishment of the pilgrims in New England, the labors of the zealous Catholics in Canada, or the planting of the colonies in Virginia, that can vie with the extraordinary adventures and sufferings of the pioneers who first traversed the broad prairies and deserts of the central portions of our continent. Long before the consecration of Plymouth Rock, the religion of Christ had been made known to the Indians of New Mexico; the country of the buffalo was visited; the Rocky Mountains were scaled; and the Gila and Colorado Rivers, which in our day are attracting so much interest as novelties, were passed again and again by the persevering and energetic Spaniard. The broad continent, too, to cross which, with all the advantages we possess, requires a whole season, was traversed from ocean to ocean before Raleigh, or Smith, or the Pilgrim Fathers had touched our shores. The topic is too prolific to be crowded into a journal of travels; and requires much study, and a careful examination of the numerous Spanish manuscripts and early books in which the remarkable adventures alluded to are related.

The geography of New Mexico, and of the other countries visited by the Boundary Commission, is also a subject of deep interest, and requires more space than can possibly be given to it at this time. I shall therefore say no more than is necessary to make the reader familiar with the prominent features of the particular region over which he follows us, and of the towns and villages through which we pass. With this understanding, I shall give a brief account of El Paso, and the adjacent district.

The town of *El Paso del Norte* is situated on the western bank of the Rio Grande, otherwise known as the Rio Bravo del Norte, in the north-eastern corner of the State of Chihuahua. It is compactly built for the space of half a mile near the plaza; and from there it extends from five to ten miles along the rich bottom lands of the river, each house being surrounded by orchards, vineyards, and cultivated fields. The valley or bottom land is here from one to two miles in width. There were regular missionaries here before the year 1600, who traced the valley far to the north; the precise date of their permanent establishment is not known, though I think it may with some certainty be placed in 1585. At the time of the advent of the Spaniards, the Piro Indians, who occupied the valley extending as far north as Taos, had a village called Sinecu, which still exists within the space now allotted to the town; and it is quite probable that from a missionary establishment here, arose the present town of El Paso. Its name is not owing to its being the pass of the river; for that is fordable at all points, by levelling its muddy banks, except where its current is deepened by being contracted within a very narrow space. Between two and three miles above the plaza, where the river forces its way through the mountains, there is a dam, the object of which is to raise the water and divert it into the *acequias*, or irrigating canals, which conduct it through the bottom lands on both sides of the river. The principal of these canals, called the *acequia madre*, is about fifteen feet wide; from it smaller ones branch off in every direction.

As may readily be supposed, with a rich alluvial

soil, and water at command, the productiveness of this valley is great. The chief cereals cultivated are wheat and maize. Oats were first planted the season I was here, and the experiment was highly successful; the yield being greater than east of the Mississippi. Potatoes do not succeed in the El Paso valley. Many attempts have been made to naturalize them by early and late planting, as well as varying the quality of water; but all have proved unavailing. It is true I have seen very good potatoes raised farther north, in the vicinity of Santa Fé; but the failures have been so numerous that they cannot be said to succeed. Onions and pumpkins are raised to a great extent, the former yielding enormously. Other vegetables are but little cultivated; which I think is more owing to the want of attention than to any fault of the soil or climate. The fruits are grapes, apples, pears, quinces, peaches, and apricots. The quinces are quite equal to our own; but the peaches lack the delicious flavor of the northern fruit, and the apples and pears are decidedly inferior. The grape is the most extensively cultivated of all fruits. It resembles the Hamburgh grape, though not quite as large, and is said to have been brought from Spain. There are both white and purple varieties. Large vineyards of this delicious fruit are seen within the town and the district adjacent to El Paso. The vine is never staked or trailed. It is trimmed close in the fall; and in the spring it throws out its shoots from the very stump, near which hangs the fruit. Each vine is kept separate, and the earth around freed from weeds. Careful cultivators cover the vines during the winter with straw. With the

first opening of spring the vineyards are irrigated, or rather inundated; for the water is suffered to flow over them, and there to remain until the ground is thoroughly saturated. This is generally all the water they get. In July, the grapes come to maturity, and last full three months. As may be supposed from the abundance of this fruit, it is exceedingly cheap, and forms a large portion of the food of the inhabitants during the season.

In order to extract the juice of the grapes, they are thrown into large vats, and trodden by the naked feet of men; after which they are put into bags or sacks of raw ox-hide and pressed. The wine of El Paso enjoys a higher reputation in certain parts of the United States than it deserves. I have drank little that was above mediocrity; and it served me as it does most others who are not used to it, causing a severe headache. But I have no doubt that with proper attention a superior quality of wine may be produced here; and such is the opinion of those familiar with grape countries, who have tasted the El Paso wine. Brandy, or *aguardiente*, is also made from the grape. It is of a light color, and is known in New Mexico as "Pass Whiskey." Both the wine and brandy are transported to various parts of New Mexico and Chihuahua; and some even finds its way to Durango.

The Rio Grande valley near El Paso, and generally in other places, is thickly timbered with cotton-wood. The trees sometimes grow to a large size. Mezquit is found on the borders between the plateau and the valley; on the plateau itself it appears in a shrubby state. Cotton-wood and the roots of the mezquit constitute the fuel of the country.

The river near the town varies in width from 300 to 600 feet. It is muddy and sluggish except during freshets. In no place, between its source above Santa Fé and its mouth, is it spanned by a single bridge. It is easily forded at El Paso, and probably for two thirds its length, the greatest depth of the water where it is crossed being only from two to three feet. Still, there are places, even near El Paso, where it is much deeper. The ford changes more or less every season. In some places there are quicksands; in which wagons sink so deep, that they are extricated with the greatest difficulty, and are sometimes lost. The freshets that take place are owing to the melting of the snows in the Rocky Mountains. These are not of yearly occurrence; for during the summers of 1851 and '52, there were none. The river not only did not swell or overflow its banks, but in the former year it became quite dry near El Paso, all the water being transferred to the acequias.

A mistaken idea prevails in regard to the great advantage of artificial irrigation over that of natural rains. It is true that where the cultivator can depend upon an ample supply of water at all seasons in the irrigating canals, he possesses an advantage over him who relies exclusively on nature. But the misfortune is, that when water is most needed, the supply is the scantiest. In February and March there is always enough for the first irrigation. In April and May the quantity is much diminished; and if the rise, expected to take place the middle of May, fails, there is not enough to irrigate properly all the fields prepared for it. The consequence is, a partial failure of the crop.

In 1851 many large tracts of land near El Paso, which were planted in the spring, and through which irrigating canals were dug at a great cost, produced nothing; and I was told by a gentleman at San Eleazario, twenty-five miles below El Paso, that the summer of 1852 was the first one in five years when there had been sufficient to irrigate all the lands of that vicinity which had been put under cultivation. The value of lands dependent on artificial irrigation is much lessened when this fact is known.

Much has been said of the great value of the Mesilla valley on the Mexican bank, some thirty or forty miles above El Paso. We have a similar valley on our side of the Rio Grande, as well situated and equally productive. We have besides more than two thousand miles of this river bottom, between the source of the Rio Grande and its mouth. Where the hills and mountains approach close to the stream, there is of course little or no bottom land; while at other places, it varies from a hundred yards to four miles in width. But of this fertile land not one tenth part can ever be regularly and successfully cultivated, owing to the uncertainty of the supply of water. The Rio Grande receives no tributary for more than four hundred miles, reckoning above and below El Paso; and if there is now found to be not water enough even for the limited district near that town, what is to be done with the vast tract along the river below in a time of scarcity?

The houses at El Paso are all of one story, and built of *adobe*, i. e. the mud of the valley formed into bricks from twelve to eighteen inches long, and four

inches thick, and baked in the sun. This material, with slight repairs, will endure for centuries. Sometimes chopped straw and gravel are mixed with it, which greatly improves its quality. The houses of the better classes are large, and built in the form of a hollow square. The walls are from two to three feet in thickness, and have but few openings. When plastered and whitewashed they look very neat, and make comfortable dwellings. All the floors are laid with mud, concrete, or brick. Such a thing as a wooden floor is unknown in the country. This mode of building, as well as the material, is precisely that adopted by the

Church and Plaza, El Paso.

ancient Assyrians, and practised at the present day on the banks of the Euphrates and the Nile. From the

East the style was introduced into Spain by the Moors, and by the Spaniards was taken to Mexico. Moorish capitals and ornaments are still visible both in the fine dwelling and the humble cottage in northern Mexico. There is a venerable looking church here, constructed of adobe, which the cura, Ramon Ortiz, informed me had been built more than two hundred years.

Window glass is not used here. The ordinary dwellings of the poorer class have no windows. The larger ones are entered by a large gateway, and have a few barred openings on the street. The other three sides present externally an unbroken and prison-like appearance. To all other parts of the house the light is admitted through windows or doors opening on the inner area. As the period is short during which the weather requires the houses to be closed, the occupants make them sufficiently warm by covering the opening with muslin or white cotton. Fires are but little used, except for cooking; and although it is cold enough at times, the people manage to get along somehow through the winter without them.

Until the advent of the Americans after the Texan annexation and the Mexican war, the *Paseños* were a most primitive people. There was no town of any note nearer than Chihuahua, in Mexico, three hundred miles distant, and San Antonio, on the eastern side, six hundred and seventy miles off. Hence they saw few strangers, and enjoyed few of the luxuries of their civilized brethren. A *metate* stone on which to grind their corn and wheat, and a few articles of coarse pottery, constituted the utensils of the poorer classes for eating, drinking, and cooking. At present they

obtain every thing that can be transported thither by wagons, though, of course, at a greatly enhanced cost. The price of labor too has doubled, and in some cases quadrupled. Day laborers (Mexican) receive five reals (sixty-two and a half cents), and find themselves. Mechanics, who are chiefly Americans, command very high wages. Carpenters and blacksmiths earn three dollars a day, and when they take jobs, much more. Corn (maize), in the winter of 1850-'51, brought from seven to eight dollars a fanega of two bushels and five eighths, although the following year it fell to five dollars.

There are now two flour mills at the falls near El Paso; one on the Mexican side, belonging to Ponce de Leon, and one on the American side, belonging to Mr. E. Hart. The latter is a fine establishment, and now supplies the United States troops here with flour. In 1850-51 flour was selling here from ten to twelve and a half cents per pound.

There are a few respectable old Spanish families at El Paso, who possess much intelligence, as well as that elegance and dignity of manner which characterized their ancestors. Among these may be found many names which are illustrious in Spanish history and literature. But there is no great middle class, as in the United States and England. A vast gulf intervenes between these Castilians and the masses, who are a mixed breed, possessing none of the virtues of their European ancestors, but all their vices, with those of the aborigines superadded. The Indian physiognomy is indelibly stamped upon them; and it requires little sagacity to discriminate between the pure and

the mixed race. The latter are generally very dark, though some are seen of fairer complexion.

The upper class dress as we do. Among the inferior classes, the men wear a short jacket with large white cotton drawers, over which are drawn pantaloons, open at the outer side, from the hip down. Along this are rows of gilt buttons and other ornaments. Around the waist a red silk sash is generally worn. The whole is covered with a *serape* or blanket in cold weather. All the women wear the *reboso*—a scarf thrown over the head and around the shoulders: it is made of silk or cotton, and costs from one to thirty dollars. The most respectable ladies generally appear in the street in black, but at evening parties the richest and most gaudy articles are worn. Smoking is indulged in by all classes, and by both sexes. It is not considered proper, however, for young gentlemen or ladies to smoke before their parents. I noticed the same respect shown by all at an entertainment when the Bishop of Durango was present. After dinner cigars were brought in. Every gentleman helped himself, and retired to another room to smoke, leaving his reverence and myself alone.

El Paso, on the Mexican side of the river, which I have been describing, contains about five thousand inhabitants; but the number would be much increased by including the many ranchos and haciendas below the town, which properly appertain to it. On the American side there are but few houses; and these may be divided into three groups or settlements. The first is Coons' Rancho. This was the first settlement, and

was the military post for about three years, under the command of Major Van Horne. Many of the buildings are now unoccupied.

About one and a half miles below is the principal village, which was established by James W. Magoffin, Esq., a gentleman from Missouri, and one of the oldest American settlers in the country. This place is called Magoffinsville, and was the head-quarters of the Boundary Commission while in the country. Its enterprising proprietor has erected around a large open square some of the best buildings in the country, which are now occupied as stores and warehouses. This is an admirable situation for a town, and will, no doubt, be the centre of the American settlements at El Paso.* An acequia now runs through the square, and the land around is of the finest quality. A mile further east is a large rancho belonging to Mr. Stevenson, around which is a cluster of smaller dwellings.

About ten miles below El Paso is an island some twenty miles in length; it is one of the most fertile spots in the whole valley, and has been cultivated since the first settlement of the country. On this island, which belongs to the United States, are the towns of Isleta, Socorro, and San Eleazario, chiefly inhabited by Mexicans. Of these San Eleazario is the larger, and was the old *Presidio* or military post on the frontier. It contains many respectable Spanish families, and some few Americans. It is now the seat of the county

* The exact position of the centre of this plaza or square, as determined by Lieut. Whipple, is $31^{\circ} 46' 05''$, 5 north latitude, and $7^{\circ} 5' 24''$ longitude west from Greenwich. The distance due south to the centre of the channel of the Rio Grande is 2,226 feet.

water failed, and with it the crops. At Fort Fillmore, about forty miles above El Paso, is the next settlement. Between this and Frontera there is a broad alluvial bottom of great richness, unsurpassed by the Mesilla valley opposite, or any portion of the valley of the Rio Grande.

The mountain chain through which the river has here worked a passage, is but a spur of a higher range, which, about two miles east of the river, rises to the height of 1,500 feet. This range extends in a northerly direction, but is not continuous. About twenty miles to the north, it gradually drops off, leaving a passage of several miles, when it again rises to a greater height, into the *Sierra de los Organos*, or Organ Mountains, so named from their numerous pinnacles, which, at a distance, resemble the pipes of an organ. Both the Spaniards and the aborigines display a much better taste in the appellations given by them to mountains, and other objects of natural scenery, than is usually exhibited by our people. Their names are significant of the appearance which the mountain assumes, while ours are christened after some military officer or politician, who may have made a little noise in his day, but may have never been near the locality which bears his name. The portion near El Paso is without timber; but the Organ range, which abounds in deep gorges and ravines, is covered with heavy pine forests to its very summit. The valleys, too, and the rounded hills, which are composed of the debris, present many groves of oaks. On the opposite side of the river, arising from the spurs or lesser chain, which connect

it with the range on the eastern side, is another elevated chain, much broken and very rugged. This is without timber and quite barren.

Cactaceous plants abound on these mountain sides, and on the spurs leading from them. The yucca, Spanish bayonet, mezquit, larrea, and the various plants peculiar to desert regions, and the great plateau are found here. The lower spurs and intervening valleys are, in many places, covered with grama grass. The bottom lands are not grassy, as many suppose, but are entirely bare, save in isolated spots; hence it is necessary to drive mules and cattle to these hills and valleys to feed. There are, however, some portions of the higher valley above Frontera where grazing is to be found.

The height of the valley at El Paso was found to be 3,800 feet above the level of the sea. At Doña Ana, sixty miles above, on the river bottom, 4,060 feet. At Albuquerque, about two hundred and fifty miles above El Paso, Dr. Wislizenus found the elevation to be about one thousand feet higher; and supposing the circuitous course of the river through this distance to amount to four hundred miles, the fall of its water would be on an average two and a half feet per mile. But the sinuosities bear a greater proportion than this to the distance; for, in a direct line of about thirty miles from El Paso to the initial point, surveyed by Mr. Radziminski, Principal Assistant Surveyor of the Commission, the river was found to measure a fraction less than ninety miles.

CHAPTER IX.

EL PASO TO THE COPPER MINES.

Observations on the Rio Grande, from El Paso to Doña Ana—Establishment of the Initial Point, and ceremonies connected therewith—Description of Doña Ana—Mesilla—Route to Santa Barbara—Visit to ruins—Mirage—Route to the River Mimbres—Luxuriant vegetation on its banks—“Giant of the Mimbres”—Ojo Caliente—A broken arm—Arrival at the Copper Mines—Description and history of the Mines—Value of the timber in the vicinity—Abundance of game—Scarcity of vegetables—Visit to Sonora projected.

April 19, 1851. The members of the Commission not on duty, the Quarter-master and the Commissary, with all that appertained to their departments, had already taken their departure and established themselves at the Copper Mines. Having made my arrangements to move this morning, I took leave of my friends with many regrets. I had now been at El Paso five months, and departed with the intention of reaching the shores of the Pacific before my return. A wild and barren region lay before us, destitute of inhabitants save hostile bands of Indians which roamed over the deserts or hid themselves in the fastnesses of the mountains; where water was exceedingly scarce, where there was but little sustenance for our animals, and where we could expect no assistance in case our provisions fell short.

Yet, with these prospects before us, I had every reason to believe, if the officers we were waiting for should soon present themselves, that by letting the surveying parties at once take the field in various sections of the work, we should be able to complete the survey of the line which constitutes the southern boundary of New Mexico, as well as of the River Gila to its junction with the Colorado, and return to El Paso before winter set in.

Our first stop was for an hour or two, at the astronomical observatory at Frontera; soon after leaving which, one of my mules was attacked with colic, probably from eating green grass. This delayed us for some time. Various inward remedies were resorted to, without apparent effect, when the poor creature was rolled and pounded by the merciless teamsters, until I thought there was no life in him; nevertheless, this rude treatment seemed to answer: for at length we were enabled to drive him along. We continued our journey, and encamped in the Alamos, or cotton woods, twenty-eight miles from El Paso. After leaving that town, the road winds over a wild, rugged, and hilly country, for nearly eight miles. These hills are the spurs of the mountain ranges, through which the Rio Grande forces its passage. They consist chiefly of limestone, which often appears above the surface, or projects from the hill sides. Many organic remains are here found. There is no bottom land for the entire distance; nor is there sufficient space by the river's bank even for a road or mule path: consequently the way is very difficult and tortuous until the hills are passed. The bottom land does not appear for some

distance beyond the observatory or, White's Rancho. The only vegetation on this barren district, is the mezquit chapporal, the larrea Mexicana, wild sage, yucca, and Spanish bayonet. In some places, are patches of grama grass. On the immediate banks of the river, are cotton-wood trees, but none elsewhere. All Americans who visit this district, express their surprise that the Mexicans, when they came out to intercept the march of the American army, under Colonel Doniphan, did not fortify this pass, and make a stand here, instead of facing our troops on the open plain at Bracito, a few miles beyond.

A large piece of bottom land has just been ploughed up and put under cultivation, by Mr. Magoffin, about twelve miles above Frontera, the only cultivated spot between El Paso and Cruces, a distance of nearly fifty miles. The first step to be taken in bringing these lands under cultivation, is to dig a large ditch from the river some distance above, and bring the water through the land. This is always kept full, and to make it available, the surface of the water should be above the level of the ground, and supported by embankments. When it is required for irrigating purposes, the bank is opened, and the water suffered to overflow the land. The necessary canals were here dug, the ground ploughed, and the seed put in; but unfortunately (as I afterward heard), the river did not rise, the canals and ditches remained dry, no rain fell, and the whole crop failed. The place was then abandoned. Such is the uncertainty of crops in the Rio Grande Valley.

April 20th. Moved from camp at 7 o'clock, and continued our journey along the bottom. Whenever we approached the river, there were more trees, fine groves of large cotton-wood, with occasional mezquit marking the valley. The road is excellent, and continues so without any repairs, except after rains, when it becomes almost impassible. At such times, wagons pursue a course lying at a distance from the bottom, and over the edge of the gravelly plateau, which is never affected by rains. The soil of the whole valley or bottom of the Rio Grande, is not surpassed for fertility, in the world. One thing alone is lacking to render it at all times productive, namely, water. For the want of this, a large portion of this rich bottom is destitute of grass, and has but little shrubbery.

Passed the small town of Cruces, a recently established place, eight miles from Doña Ana, soon after, where we soon arrived. As the train was still several miles behind, I accepted the invitation of Captain Buford of the Dragoons, to take up my quarters with him.

April 23d. Crossed the Rio Grande to the camp of Mr. Salazar, the Astronomer of the Mexican Commission, to learn if General Condé had arrived. Afterwards rode to the neighboring hills, across which the line would pass, with the view of selecting a conspicuous spot for a monument. The bank near the river not being sufficiently elevated, I determined to place a small monument with inscriptions there, and to erect a large pyramidal one on a lofty conical-shaped hill, which itself appeared like an artificial structure at a

distance. The line passed directly over this, and a monument upon it would be seen for a great distance in every direction.

April 24th. The day having arrived upon which it was agreed that the Initial Point, where the southern boundary of New Mexico intersects the Rio Grande, should be established, the documents signed, and the point marked, it seems proper that I should briefly relate the history of this important portion of my duties as Commissioner under the 5th Article of the Treaty of Guadalupe Hidalgo.

Under the date of December 3d, 1850, I spoke of the meetings of the Joint Commission, and of the difficulties that lay in the way of a speedy agreement as to the boundary between the Rio Grande and the Gila, in consequence of two gross errors in the map to which the Commissioners were confined by the treaty. It was discovered that the Rio Grande was laid down on this map, more than two degrees too far to the eastward—the river, where it is intersected by the southern boundary of New Mexico, being really in $106^{\circ} 40'$ west longitude, instead of $104^{\circ} 40'$. The other error was in the position of the town of El Paso, which appears on this map to be but seven or eight minutes below the 32d parallel, while its actual distance is thirty minutes further south. After several meetings, involving much discussion, the Joint Commission agreed to fix the Initial Point on the Rio Grande at the latitude given by the map, without any reference to its distance from El Paso; and to extend it westward from that point three degrees, without reference to where the line so prolonged should terminate. This being agreed

upon, the acting Chief Astronomer, Lieutenant A. W. Whipple, on the part of the United States, and Don José Salazar, the Chief Astronomer on the part of Mexico, were directed to "measure, according to Disturnell's Map, edition of 1847, the distance between latitude 32° and the point where the Rio Grande strikes the Southern Boundary of New Mexico; and also the length of the Southern Boundary line of New Mexico from that point to its extreme western termination," and to report the result of their examinations to the Commissioners at the earliest period practicable.

At the meeting of the Commission held on the 25th day of December, the following report was presented:

"In accordance with resolutions passed on the 20th instant, at an official meeting of the United States and Mexican Boundary Commissioners, we, the undersigned, have this day met for the purpose therein indicated.

"With a certified copy of the Treaty Map before us, we proceeded to make a scale of minutes of latitude, by dividing into 120 equal parts, the length of that portion of a meridian laid down upon the map between the parallels of 32° and 34° of north latitude.

"In a similar manner we found a scale of minutes of longitude for that degree of latitude, which passes through points of the Southern Boundary of New Mexico, as indicated upon the same map.

"Then measuring the distance from the point where the middle of the Rio Grande strikes the Southern Boundary of New Mexico, south to the parallel of latitude marked 32° , and applying it to our scale of minutes of latitude, we found the length equal

sion, to be adopted as the boundary point, at $32^{\circ} 22'$ north latitude.

The Joint Commission therefore met at the place referred to, to "establish the point where (according to the fifth Article of the Treaty), in the Boundary between the two Republics, the Rio Bravo or Grande, strikes the Southern Boundary of New Mexico." At this time the Surveyor, Mr. A. B. Gray, had not arrived, although fourteen months since the time of the adjournment in California, and five months after the time agreed upon for the meeting at El Paso. I then proposed to General Condé the Mexican Commissioner, that Lieutenant Whipple should officiate as Principal Surveyor until the arrival of Mr. Gray. To this arrangement General Condé signified his assent; whereupon I addressed the following note to Lieutenant Whipple, whose camp was then near mine.

"IN CAMP, NEAR THE INITIAL POINT,
April 23, 1851.

"DEAR SIR: The fifth Article of the Treaty of Guadalupe Hidalgo, requires that the two Governments shall each appoint a Commissioner and a Surveyor, to run and mark the boundary line between the two Republics.

"The Surveyor in behalf of the United States has not arrived; and having received no advice from him, it is impossible to conjecture when he will be here. The present is the most propitious period of the year for field duty; every thing is in readiness for continuing the operations connected with the survey, and the Mexican Commissioner is urgent to have the business proceeded with.

“Under these circumstances, being unwilling that any blame should attach to the United States, by a delay in the proceedings of the Joint Commission, I have thought proper, by and with the consent of the Mexican Commissioner, to designate you to act as Surveyor during the temporary absence of A. B. Gray, Esq. You are therefore requested to be present at the spot fixed upon for the Initial Point, to take part in the ceremonies as acting Surveyor.

“I am very respectfully,

“Your obedient servant,

“JOHN R. BARTLETT,

“*Commissioner U. S. Mexican Boundary Survey.*”

“To Lieut. A. W. WHIPPLE, Topog. Engineers,

“Acting Chief Astronomer, U. S. B. Com'n.

“In Camp, near Initial Point, New Mexico.”

Lieutenant Whipple immediately complied with my request, and the Commission proceeded to the place which had been designated by the Astronomers as the Initial Point on the Rio Grande, escorted by Captain Buford of the 1st Dragoons, with his company.

We found General Condé with the Mexican Commission, the civil authorities of El Paso, and a body of Lancers already on the ground awaiting our arrival. The Joint Commission then held a meeting to agree upon the order of ceremonies to be observed on the occasion; after which we assembled around the spot which was to be marked, where a post had been

planted, and a small excavation made. The document, of which the following is a copy, confirmatory of these proceedings, was read aloud in English and in Spanish, by the Secretaries, after which it was signed by the Commissioners and Surveyors of the two Commissions, and witnessed by the Secretaries and other individuals who had been invited to be present for the purpose. It was then placed in a bottle, with a list of the members of the Commission, and a fragment of the Washington Monument, and was sealed up and deposited at the place designated.

COPY OF DOCUMENT.

“ Be it remembered, that on the twenty-fourth day of April, in the year of our Lord, one thousand eight hundred and fifty-one, the Commissioners and Surveyors, on behalf of the United States and of Mexico, named to run the Boundary Line between the two Republics in conformity with the Treaty of Peace, dated at the city of Guadalupe Hidalgo, on the second day of February, one thousand eight hundred and forty-eight, and exchanged at the city of Queretaro, on the thirteenth day of May of the same year, being fully satisfied with the operations made, and the results obtained, by the Chief Astronomers of the two Commissions, do establish this point, on the right bank of the River Bravo, or Grande del Norte, in $32^{\circ} 22'$ north latitude, which in accordance with the provisions of the fifth Article of said Treaty, is ‘ the point where it [the said river Bravo or Grande del Norte] strikes the Southern Boundary of New Mexico ’

“Be it likewise remembered that the distance from this point to the centre of the bed where now actually runs the River, in the direction of the same parallel, is (219^m 4) two hundred and nineteen metres, and four tenths, following the line east from said point.

“For the greater solemnity of this act, appear as witnesses, on the part of the United States, Captain Abraham Buford, of the First Dragoons, and Colonel Charles A. Hoppin, Aid-de-Camp to His Excellency James L. Calhoun, Governor of New Mexico: And on the part of Mexico, Mr. B. Juan José Sanchez, Political Chief of the Canton of Bravos, in the State of Chihuahua, as first authority of that place.

“Written in duplicate, in English and Spanish, and sealed, at the point established, on the day of the month and year aforesaid.

“PEDRO GARCIA CONDE, *Commissioner*.

“JOHN RUSSELL BARTLETT, *Commissioner*.

“JOSE SALAZAR Y LARREGUI, *Surveyor*.

“A. W. WHIPPLE, *Topog. Engr. Surveyor and Astronomer*.”

“Signed in presence of

“THOMAS H. WEBB, *Secretary*.

“JUAN JOSE SANCHEZ.

“FRANCISCO JIMENEZ, *Secretary*.

“A. BUFORD, *Bvt. Capt. 1st Dragoons*.

“CHARLES A. HOPPIN, *Aid-de-Camp to Governor Calhoun of New Mexico*.”

Immediately after the Initial Point had thus been established, a plan was submitted by the Chief Astronomers and Surveyors of the two Commissions to carry

on the work and mark the line. This was accepted; parties were at once organized, and the survey was commenced two days after.

I have thought it proper, in this my personal narrative, to relate briefly the principal events which constituted the main objects of the Commission, and, in so doing, to give the particulars connected with the establishment of the initial point on the Rio Grande and the southern boundary of New Mexico. In so doing I have spoken merely of the mode of determining this boundary, without, in any manner, going into the argument as to its conformity with the treaty. My readers can be the judges of this. My defence of the point and line established, with the argument of Mr. Gray in opposition to them, was presented to the Hon. Alexander H. H. Stuart, Secretary of the Interior, on the 7th of February, 1853, on my return from the Survey, and ordered by the Senate to be printed. This forms Senate Executive Document No. 41. 32d Congress, 2d Session.

After the establishment of this important point, I immediately made known the particulars connected with it to the Honorable Secretary of the Interior. (See my despatch, No. 15, Senate Document No. 119. 32d Congress, 1st Session, p. 406, which I append.)*

**(J. R. Bartlett to Mr. Secretary Stuart.)*

MEXICAN BOUNDARY COMMISSION,
SAN RITA DEL COBRE NEW MEXICO,

[No. 15.]

May 10th, 1851.

SIR: In my last dispatch, bearing date the 14th ultimo, I had the honor of advising you of the movements of Acting Chief Astronomer

In order to show the views of the government with respect to my proceedings, particularly with reference to the appointment of Lieutenant Whipple as Surveyor

Lieutenant A. W. Whipple, preliminary to the establishment of the initial point of the boundary line on the Rio Grande.

The Chief Astronomers of the two Commissions having mutually agreed upon and advised the Commissioners of the spot where, according to the results of their united observations, the point should be fixed, the joint Commission met at the place on the 24th ultimo, for the purpose of examining and ratifying the proceedings of said astronomers, should they be satisfied with regard to their accuracy.

According to the treaty of Guadalupe Hidalgo, the presence of the Chief Surveyors is required on this occasion. The absence of Mr. A. B. Gray placed me in a very delicate position, which was rendered still more perplexing by the fact that the same treaty distinctly declares that the Chief Surveyor (no less than the Commissioner) shall be appointed by the government; and no provisions are made for contingencies like the present one; nor have I been clothed with power to appoint an individual to act temporarily as Surveyor. The difficulty was stated to the Mexican Commissioner, who, in reply, observed, that all the necessary arrangements on his part had been made to go forward with the survey at once, and he trusted that it would be proceeded with accordingly. Being unwilling that any obstacles in my power to remove should impede the progress of this important business, I did not hesitate to make known my readiness to assume the responsibility of designating some one to act in the room of Mr. Gray for the time being, provided the Mexican Commissioner, in behalf of his government, would consent to the course, and thus prevent or obviate any supposed cause of complaint by that Republic hereafter. General Condé assenting to the proposition, I designated Lieutenant A. W. Whipple as Acting Chief Surveyor.

The Commissioner and Surveyor having visited the spot, designated and examined the observations made, conferred together, and being satisfied with the proceedings of the astronomers, ratified their decision, and announced in the presence of the assemblage collected on the occasion, that they then and there established the Initial Point of that

ad interim, and that the work should not be delayed in consequence of Mr. Gray's absence, I also append a copy of a letter addressed by Mr. Secretary Stuart to the Honorable Daniel Webster on this subject.*

portion of the boundary between the United States and the Republic of Mexico, which at 32° 22' north latitude, is to run westward 3° along the whole southern boundary of New Mexico.

And as a further evidence of the decision made, and arguments entered into by the authorities representing and acting in behalf of the two Republics, they then deposited at the spot whereon the initial point monument is to be erected, a glass vessel containing a copy, in Spanish and English, of the accompanying document, duly signed, sealed, and witnessed.

I have the honor to be

Your most obedient servant,

JOHN R. BARTLETT,

Commissioner.

To the HON. ALEX. H. H. STUART,
Secretary of the Interior,
Washington.

*(*Letter from the Hon. Alex. H. H. Stuart to the Hon. Daniel Webster.*)

DEPARTMENT OF THE INTERIOR,

February 11, 1852.

SIR: I have the honor to acknowledge the receipt of your letter of the 2d instant, referring to this Department, a communication addressed to you in January, 1852, by José Gonzales de la Vega, Chargé d'Affaires *ad interim* of the Republic of Mexico, and complaining of the delays which have occurred in the progress of the work connected with the Mexican Boundary Survey. In reply to the communication of M. de la Vega, I have to state, that while it is to be regretted that any delay has occurred in the vigorous prosecution of the survey of the boundary between the two Republics, every thing has been done by this Department with the view to a prompt, energetic, and harmonious action on the part of the officers of the respective governments, in order that the

Doña Ana is a small town of five or six hundred inhabitants, and stands upon a spur of the plateau, fifty or sixty feet above the bottom lands, thereby commanding a wide prospect of the adjacent country.

important work upon which they are engaged may be completed without unnecessary interruption.

In reference to the appointment of Lieutenant Whipple as Surveyor *ad interim* on the part of the United States, to which M. de la Vega refers, I will remark, that this appointment was necessary on account of the protracted and dangerous illness of Mr. A. B. Gray, the Surveyor. Lieutenant Whipple was recognized by this government as Surveyor *ad interim*, and his official acts in that capacity were, by directions from this Department to Mr. Gray, to be considered as binding on the latter officer, who was instructed to perfect, by his signature, any documents prepared requiring it.

The Department relieved Lieutenant Colonel Graham from duty as Chief Astronomer of the Commission, and Lieutenant Colonel William H. Emory was appointed to succeed him; and as the interests of this government seemed to require a diminution in the number of officers on the part of the United States, to prevent, as far as practicable, unnecessary interruption in the progress of the Survey, and to place the organization of the American Commission on a permanent footing, the President also appointed Lieutenant Colonel Emory the Surveyor on the part of the United States, under the 5th article of the Treaty of Guadalupe Hidalgo, in the place of A. B. Gray, Esq., with instructions to proceed at once to the scene of operations, and report to the Joint Commission.

It is hoped that the Joint Commission will now proceed without interruption to the close of their operations on the Survey, and that nothing will transpire on either side to cause any delay in the early settlement of the boundaries between the two Republics.

I am, Sir, &c.,

ALEX. H. H. STUART,

Secretary.

HON. DANIEL WEBSTER,

Secretary of State.

[Senate Ex. Document 119. 32d Congress, 1st Session, p. 124.]

It has been settled but a few years, and was selected on account of the broad and rich valley near, and the facilities that existed for irrigating it. Its houses are mostly of a class called *jacals*, i. e. built of upright sticks, their interstices filled with mud, though a better class of adobe buildings have just been erected along the main street, for the occupation of the military, and for places of business. The central position of Doña Ana, and its fine lands, led to its selection for a military post. At the time of my visit there were two companies of United States troops here under the command of Major Shepard.

Six or eight miles below Doña Ana, on the opposite side of the river, is the town of *Mesilla*, containing between six and seven hundred inhabitants,* a place which owes its origin to circumstances growing out of the late war with Mexico. These circumstances it may be proper to relate, as well as the origin of its name.

Mesilla is the diminutive of the Spanish word *mesa*, i. e., table, also table-land, or plateau, and is applied to a lesser plateau in the valley of the Rio Grande, beneath that of the great *mesa* or table-land, which extends for several hundred miles in all directions from the Rio Grande. It is situated on the western side of the Rio Grande, about fifty miles above El Paso, in latitude about 32 degrees 18 minutes north, and until the year 1850 it was without an inhabitant.

Immediately preceding, and after the war with

* This was the population in March, 1851, as stated to me by the authorities of El Paso.

Mexico, the Mexican population occupying the eastern bank of the Rio Grande in Texas and New Mexico were greatly annoyed by the encroachments of the Americans, and by their determined efforts to despoil them of their landed property. This was done by the latter either settling among them, or in some instances forcibly occupying their dwellings and cultivated spots. In most cases, however, it was done by putting "Texas head-rights" on their property. These head-rights were grants issued by the State of Texas, generally embracing 640 acres, or a mile square, though they sometimes covered very large tracts. They were issued to persons who had served in her wars, like our military land warrants, and also to original settlers. Such certificates are still bought and sold in Texas. The owner of them may locate his land where he pleases, unless previously occupied, or in lawful possession of another.

With these land certificates, or "head-rights," many Americans flocked to the valley of the Rio Grande, and in repeated instances, located them on property which for a century had been in the quiet possession of the descendants of the old Spanish colonists. The latter, to avoid litigation, and sometimes in fear for their lives, abandoned their homes, and sought a refuge on the Mexican side of the river. Doña Ana, a modern town on the eastern bank of the Rio Grande, being a desirable place, and moreover selected by the United States for one of its military posts, became an attractive point for speculators, and was in consequence pounced upon by them, and covered by the Texan land warrants. Whether the Mexican occu-

pants of the town and lands adjacent were the lawful owners or not it is needless to investigate; it is sufficient to say that they were the first settlers, and had long been in undisturbed possession. They now became alarmed. Litigations commenced. Some applying to the authorities of New Mexico, Texas, or the United States, for protection. Failing to obtain it, several hundred abandoned their property and homes in despair, and sought an asylum in Mexican territory, preferring the very uncertain protection they could obtain there to remaining as citizens of the United States.

With this resolution, a spot was selected on the opposite or western side of the river, six or eight miles below Doña Ana, which, it was believed, would be within the limits of Mexico. On the 1st March, 1850, sixty Mexicans, with Don Rafael Ruelas at their head, most of whom had been domiciled at Doña Ana, abandoned their homes on account of their many grievances, and moved to the lands known as the Mesilla, where they established themselves. To increase the colony, the government of Mexico offered to give lands to other actual settlers, which offer induced large numbers of dissatisfied Mexicans living in New Mexico and in the small settlements along the Rio Grande, in Texas, to remove there. More than half the population of Doña Ana removed to Mesilla within a year.

When the boundary line was established in April, 1851, and it became certain that La Mesilla was south of the boundary line, according to the treaty map, their fears were removed, and a day was set apart for public rejoicing. For the whole population had de-

terminated to abandon the place if the boundary line had run south of the village, and thus placed them under the jurisdiction of New Mexico. The day came, and the event was celebrated by firing of cannon and a grand ball, which many from El Paso attended. After this, the population continued to increase; in October, 1852, the Prefect of El Paso estimated it at 1,900 souls.

Very few Americans ever settled there—in fact, none but traders, and it is probable that there never were twenty altogether.

The lands at La Mesilla are of precisely the same character as other bottom lands, on the opposite bank of the river, near Doña Ana and Cruces; and in fact, as far as the mountain pass above the town of El Paso.

April 27. Left Doña Ana at nine 9 A. M., accompanied by all the assistants, and others attached to the Commission, except those whose aid was required by Lieutenant Whipple in the duty he was about to enter upon. My train consisted of twelve wagons, drawn by five or six mules each, and my travelling carriage with four mules. The assistants rode on horses or mules. We continued on our course towards the north, and soon struck the great *Jornada del Muerto** (Deadman's Journey), on the Santa Fé road, which we followed for nine miles, when we turned off to San Diego, the old fording place. There is no village nor

* *Jornada*, literally, means a day's journey; but it does not seem to be used, except there is a long reach of desert country without water. It therefore is applied to one or two days' journey. The *Jornada del Muerto* is 90 miles across, without water, and of the most desert-like character.

even a rancho here, although marked on the map as a town. A great reddish bluff, composed of a conglomerate of jasper, quite detached from the adjacent hills, lay on our left. As we descended into the valley our eyes were gratified with the sight of trees and shrubbery, and more grass than we had seen since leaving El Paso. In fording the river, one of the wagons, in consequence of diverging a little from the proper course, got into a quicksand, and was near being lost. Continued our course eight miles up the stream, and encamped at half-past 5 P. M., in a beautiful grove of cotton-woods, having made twenty-six miles. There was excellent grass here, and in great abundance. The wagons did not all get up until an hour after, in consequence of the delay at the ford. A train of wagons belonging to the Commission, in attempting to cross a few weeks after, when the water was somewhat higher, got into the quicksand. The mules in struggling to free themselves, sank deeper; and before they could be extricated, all six were drowned.

April 28. Moved from camp at 7 A. M., the road continuing along the river bottom, close to a low range of gravel hills, when we diverged to the north-west. Thick groves of cotton-woods occurred at intervals, and the whole valley was more or less wooded. The young grass, and the deep foliage of the trees, were refreshing to our eyes, which for five months had gazed on little more than stunted mezquit bushes, and the thorny cactus. From the water marks on the trees, the river rises about four feet above its banks, inundating the bottom lands to the base of the hills

which border them, and rendering the valley impassable. There does not seem sufficient space to carry a road over the hills, although there may be a practicable route within, which was not visible to us. At 11 o'clock we reached a new settlement on the river's bank, called Santa Barbara, where, finding excellent grass, I determined to encamp. The road had been quite sandy and rough the fourteen miles we had come, and as the next water at the mule spring was twenty miles distant, I thought it prudent to go no farther. The settlement consisted of a few *jacal* or stick houses, part of which were in the process of erection. A deep *acequia* was already opened, and large fields of wheat and corn were now undergoing the process of immersion. Acres were covered with water; and the soil is of so spongy a nature that we found it impossible to cross these overflowed places with the wagons, so deeply did the wheels sink into it. Herds of cattle and goats; half-naked Mexicans with their hoes, peons' hooting and yelling as they urged on their oxen with their long-pointed poles; and the primitive wooden ploughs, turning up the virgin soil, exhibited a scene of industry, such as I had not before witnessed in the valley of the Rio Grande.

We pitched our tents in a thick grove of large cotton-woods, near which passed the *acequia*; while on the opposite side was a pond or laguna, extending a mile or more. As this body of water was not wider than the river, and presented many sinuosities, I think it must have been formerly the channel of the Rio Grande; for, like the Mississippi and other rivers which flow through an alluvial soil, it is continually

changing its bed, where great bends occur. The laguna is now supplied by overflows from the river. There were many wild fowl in it; but its banks were so open, that we could not approach the game.

April 29. Hearing that there were traces of an ancient Indian settlement about half a mile distant, Dr. Webb went over to examine it, while we were getting ready to move. He found a good deal of broken pottery, all of a fine texture. Some of it bore traces of red, black, and brown colors. He also found a stone mortar about eight inches in diameter. I have since understood that this was the seat of one of the earliest Spanish missions; but it was abandoned more than a century ago, and no traces remain but a few heaps of crumbling adobes, which mark the site of its dwellings.

Our course on leaving camp, was south of west. After following the valley a couple of miles, we began to ascend a range of high hills, over and through which, the road wound for about twelve miles, before we reached the highest level. In descending, the road was hard and smooth as a turnpike, and so continued until we reached our camping ground, at the foot of the hills. To the south, at some fifty or sixty miles distant, rose a high mountain, the intervening plain presenting the most beautiful mirage I ever witnessed. It seemed like the surface of a broad lake, the mountain peaks standing detached, like so many islands rising from the bed of its placid waters. If I had not known that the region before me was a barren desert, I would certainly have been deceived.

Reached Mule Spring at one o'clock. Estimated

distance travelled to-day, twenty-three miles. This spring is in an arroyo or ravine, and contains but a few barrels of water. Some ash and cotton-wood trees mark its course from the mountains where it rises. Colonel Craig, when he passed here with his command a few months before, opened the spring and sunk a barrel in it. The water is very good. In the rainy season, this arroyo is probably filled with water, as the trees and banks exhibit the marks of it.

Approach to Mule Spring. Picacho de Mimbres.

April 30th. On leaving Mule Spring, we turned nearly south, with a range of mountains on our right. This was directly out of the general course of our route, which was to the north-west; but there was no other way to pass the mountains. The road was excellent, and we traversed it rapidly, reaching Cooke's Spring, twelve miles distant, at 11 o'clock, where we stopped

to water. This spring forms a pool, some fifty feet across, surrounded by rushes. The water is a little brackish, but the grass in the vicinity is excellent. Ascended a hill on the south, which was strewn with fragments of chalcedony, of which some fine specimens were collected. From this hill the Organ Mountains were plainly seen, bearing a little south of east.

After waiting an hour to let the mules have the benefit of the grass, we hitched up and passed through the cañon or mountain defile, in a south-westerly direction, for three miles. This pass was quite hilly and stony, with some steep ravines to cross, but otherwise attended with no difficulties for wagons. After passing these mountains, our course was north-west for eight miles, when we reached the summit of a high table-land that lay before us. Here a wide view opened. The east was bounded by the long range of mountains which we had followed on the opposite side and crossed in the morning, while on the west, the broad undulating prairie was only here and there interrupted by low conical-shaped hills. At the south and south-west, detached mountains appeared abruptly springing from the plain, with jagged and picturesque summits, some of which must have been fifteen hundred feet in height. In the clear blue atmosphere of this elevated plateau, every object appeared with great distinctness, so that mountains could be seen at a distance of more than a hundred miles.

From the plateau we were traversing, we could discern, far in the distance, a streak of dark green, resembling a huge serpent. Far as the eye could reach, this dark streak wound its way, now expanding

into the plain, and again contracting its dimensions among the hills, until it finally lost itself in a high range of mountains to the north. This was the long-talked-of River Mimbres, the third stream we had seen since passing the small water-courses which empty into the Colorado, in our journey from San Antonio to El Paso, the Pecos and the Rio Grande being the other two. As we were now on the descent, with a smooth road, my mules dashed off at full speed in advance of the train, followed by the young men on horseback; for all were pretty well tired of the desert, and longed to feast their eyes on running water again; and the ten miles which separated us from the bank above the valley were soon passed over.

When we reached the verge of the hills which bound the valley of the river, a sight truly refreshing presented itself. The bottom for nearly a mile in width was covered with verdure, such as we had not seen since leaving the rich valleys near Fredericksburg, in Texas. As we rode rapidly forward, we noticed a herd of about twenty black-tailed deer quietly grazing on the luxuriant grass of the valley. Disturbed in their solitude by the rattling of the carriage and the tramping of the horsemen, they dashed away over the plain in single file, led by a large buck. We traced their course for some distance, as they bounded over the hills, until lost in the mountain ravines. Nearer the river, other deer of the same species were seen browsing upon the willows, which, in like manner, darted off at our approach.

We pitched our tents beneath a grove of cottonwood trees, at a short distance from the river, when

all hastened to taste its waters, and plunge into its cool depths. Great was our disappointment, after the anticipations we had indulged in, at finding nothing but a diminutive stream from ten to twenty feet in width, and in some places even less, which, east of the Mississippi, would hardly be designated with the name of "creek." Nevertheless, it was welcomed by us as heartily as the Ohio or Hudson would be by travelers in more favored regions; for it answered all our wants. Its water was soft and delightful to the taste, surpassing that of the Rio Grande. This stream has never been traced to either of its terminations. It rises in the mountains north-east of the Copper Mines, and when full, empties into Lake Guzman, about one hundred and thirty miles to the south; but for several months in the year it exists only in pools, or dries up entirely after reaching the plains. When the surveying parties crossed it six weeks later, about fifteen miles lower down, they found it entirely dry. Another feature, which is common to other streams in Mexico, was noticed in the Mimbres, namely, its sudden disappearance or sinking into the desert, and its re-appearance some distance beyond.

May 1st. In camp on the Mimbres. As our animals had been poorly fed since leaving El Paso, I determined to remain here to-day to give them the benefit of the fine young grass. All the party seemed to enjoy the relaxation; and they sallied out after breakfast, some in search of game, others of the picturesque. For my part, I took the two together; for when I went to the hills in search of game I carried my sketch book with me, as it was only among the wooded

hills, the defiles, and the thick groves along the river bottom, that game was to be found; and there, too, was the most picturesque landscape scenery, and the best field for the exercise of my pencil.

I first walked down the stream about two miles to a thick grove of large cotton-woods. The bottom was much contracted here; nevertheless, it was thickly wooded and forest-like. Ash and oaks were interspersed among the cotton-woods. Saw many signs of turkeys, but shot none myself. Some of the party were more fortunate and brought in several. About five miles north of our camp the river enters the hills, and a little further up, is closely hemmed in by lofty mountains. Noticed wild roses in great profusion, also wild hops, and the Missouri currant. These, in some portions of the valley, were so closely entangled together that it was impossible for one to work his way through. Found several old Indian encampments, with their wigwams standing, and about them fragments of pottery. Many well-marked Indian trails followed the river on both sides, showing that it had been, and probably is now, a great thoroughfare and place of resort for the Apaches.

In the afternoon, Mr. Bausman, one of our most indefatigable sportsmen, came in from a hunt, and reported that he had seen some remarkable rocks about five miles up the river, to the north of our camp, which were worth visiting. I immediately had my mule saddled, buckled on my pistols, attached my rifle to the pommel of the saddle, and taking my sketch book, accompanied him to the place referred to, which was about half a mile from the river on the western side.

Arriving at the place, I found some singular masses of sandstone standing detached from the adjacent hills, one of them bearing a curious resemblance to a man. My timid mule was much alarmed at the gigantic object which stood before it, trembling from head to foot. We therefore stopped a short distance from it and hitched our animals to an oak which hid from view the source of their terror. Around us stood these singular isolated rocks, some appearing like castles, others like single pedestals and columns. The one resembling a human figure, which is shown in the accompanying sketch, and which I christened the "Giant of the Mimbres," measured but three feet in its narrowest part near the ground; while its upper

Sandstone rocks. Rio Mimbres.

portion must have been at least twelve feet through, and its height about fifty. Others of equal height stood near. All are disintegrated near the earth, and

are gradually crumbling away, several having already fallen. When I had completed my sketch, we mounted our mules, and hastened back to camp, which we did not reach until some time after dark, my long absence meanwhile causing much uneasiness. Several turkeys were seen during our ride, and a couple shot. A number of fish of the trout species were taken here.

May 2d. Crossed the Mimbres, and soon after reached the level of the table-land, gradually ascending toward the high mountainous region wherein the Copper Mines are situated. Having heard of the *Ojo caliente*, a remarkable hot spring two miles from the road, I determined to visit it, and accordingly struck off the wagon road, accompanied by all who were mounted. A ride of three or four miles brought us to the spot. This spring lies within a crater-like opening, twenty feet in diameter, on the top of a mound of tufa about six hundred feet in circumference at its base, and about thirty feet high, all of which seems to consist of the deposits made by its waters. The temperature of the water was 125° Fahrenheit. Its surface was some six or seven feet below the rim of the basin; and its depth I judged to be about the same. Dr. Webb collected the gas which bubbled up from the bottom, and found it to be neither hydrogen nor carbonic acid gas. He consequently judged it to be atmospheric air. The water was not unpleasant to the taste, and would be palatable if cooled. Lower down, upon one side of the hill, a small spring burst out, and at a short distance, where it collected in a pool, the water was cool enough to bathe in; but even there I found it literally a hot bath. Mr. Thurber discovered

fresh water plants [algæ] and insects flourishing in water at this elevated temperature.

Just at the base of the hillock where the water accumulates, is a cotton-wood tree and a few bushes, where I hitched my mule before going up to the spring. On returning to take her, I had loosened the lariat, and was in the act of mounting, when the mule took fright at something and rushed into the bushes. I either fell or was dragged off, and at the same time, the malicious beast struck out her hind legs, and hit me on my left shoulder. Several rushed to my aid, and my left arm was found to be injured. After lying upon the ground a short time, I managed, with assistance, to walk about two miles to the road, where my carriage took me up. We were now about eighteen miles from the Copper Mines, and the jolting of the carriage pained me exceedingly; but as no relief could be got until we reached there, I pushed on as fast as possible. We reached the Copper Mines at 3 o'clock, P. M. Colonel Craig gave me a warm welcome, and took me at once to his quarters, when I immediately retired to my cot.

The following day my arm was examined by Doctors Bigelow and Webb of the Commission, and Dr. White of the army, who decided that there was a fracture near the shoulder. The arm was much swollen and discolored

I remained an invalid, confined to my cot or chair for two weeks, taking a little air towards the end of the second week. During this time my excellent and lamented friend, Colonel Craig, paid me great attention. He watched me with the care of a mother, get-

ting up frequently at night to turn me in my bed, which for the first week I was unable to accomplish without assistance. This he preferred doing to my having a servant in the room with us.

May 5th. General Condé, with the Mexican Commission, arrived to-day. After remaining three days, he removed his camp to the banks of the Mimbres, where he believed he would find sufficient grass for his animals.

Santa Rita del Cobre, as this place is called by the Mexicans, was for about forty years an active mining town. The workings were commenced in the year 1804, and proving very profitable, a population of about 600 souls gathered around them in the small

Valley of the Copper Mines from the South.

open space which here exists encircled by lofty mountains. The valley is so narrow here, as to afford

only a plot of about a couple of acres for cultivation, and that seems to have been used as a garden. The hills around furnish excellent grazing for any number of animals; but for agricultural productions, the population depended upon the cultivated districts at the south, in the valley of the San Miguel or Casas Grandes, from which they received regular supplies of corn, flour, beans and other articles of subsistence. These provisions and merchandise were taken to the mines by large trains of wagons, either on private account or on account of the establishment. There was also a considerable trade carried on with the frontier towns in Sonora. The nearest settlement was the Presidio of Janos, a frontier military post on the San Miguel river, 150 miles off; though the trains with their chief supplies were sent from the city of Chihuahua, situated at a distance of 400 miles. The return trains took back copper ore: this was afterwards sent to the city of Mexico, where, owing to the superior quality of the metal, it was used chiefly for coinage. It is said that the owner had a contract with government to deliver the copper there at 65 cents a pound, and that sufficient gold was found in it to pay all the cost of transportation. I do not doubt the truth of this statement, as Mr. Courcier, who first worked the mine to advantage, amassed a large fortune from it, and Mr. McKnight, his successor, also found it very profitable. In 1838, a large train from Chihuahua, with supplies, was attacked and overcome by the Apaches in the cañon leading to the mines. Such of the contents of the wagons as the savages wanted they took, as well as the mules and horses, first giving each man

who accompanied the train a mule to carry him away. At the same time they sent word to the inhabitants at the Copper Mines, that they would allow no further supplies to reach them, and, furthermore, would destroy them whenever an opportunity offered. Thus cut off from the means of support, and surrounded by large warlike tribes, the people determined to abandon the place. It had consequently remained unoccupied ever since, until taken possession of by the Boundary Commission in the present year, 1851.

Several deep shafts were sunk by the Mexicans in the adjoining hills; which, with the vast heaps and extensive excavations about them, show that an immense deal of labor has been performed here. One of the largest shafts has been filled up in consequence of the earth's caving in; as I was told by a Mexican in the employ of the Commission, who said he had lived here when the mines were worked. Others are obstructed by water, which has accumulated near their entrances. Some of the excavations are still accessible, and have been explored by many. If it should again become an object to work the mines, they might be cleared without much labor. The rock is mostly felspar, and the red oxide of copper, intermixed with native metal. Large quantities of ore are deposited near the smelting-house.

On entering these excavations, one sees the bright veins of the sulphuret of copper penetrating the rock in all directions, with here and there small masses of native copper; and it is evident that all the hills in the vicinity are quite as rich as those which have been opened, for the same indications appear on the surface.

But until there is some other mode of transporting the copper to market, than by wagons for a distance of nearly a thousand miles, it will hardly pay to work them. There is no longer a market in the city of Mexico, as other mines have been found much nearer. It now costs twenty cents a pound to transport goods from the coast at Indianola; but as the wagons go down empty, the owners would, no doubt, be glad to carry the copper at half price. Labor is cheap and abundant in Mexico. At El Paso, Mexican laborers could be had for 62½ cents a day, they finding themselves; but men could doubtless be procured at even a less price. They require only the most simple food; flour, beans, and a very little meat will satisfy their wants.

The district about the Copper Mines might be made to produce all the food needed for a mining population. There is no valley or arable land close to the mines; but eight miles to the eastward the Mimbres winds its way through the mountains, and has in many places a broad valley or bottom, which could be easily irrigated, and made to produce large crops. Hither we sent our cattle and mules, and in the driest time found an abundance of grass and water. Within two or three miles there are fine valleys, where, I doubt not, corn might be grown without irrigation, as is the case in some of the mountainous districts of Mexico; for it often rains here, when the plains below, but ten or fifteen miles distant, are parched with drought. We were not prepared to try the experiment; but, from the appearance of the soil, the richness of the grass, and general exube-

rance of the vegetation, together with the moisture which prevails in such mountainous regions, I have no doubt the experiment would be successful.

We reached this district on the 2d of May. Vegetation was then forward, though there had been no rain. But it must be remembered that during the winter there is snow, and hence a good deal of moisture in the earth when the spring opens. The months of May and June were moderately warm. On the third of July the first rain fell. It then came in torrents, accompanied by hail, and lasted three or four hours. Many of our adobe houses were deluged with water, and the mountain sides exhibited cataracts in every direction. The *arroyo*, which passes through the village, and which furnishes barely water enough for our party and the animals, became so much swollen as to render it difficult to cross; and by the time it had received the numerous mountain torrents which fall into it within a mile from our camp, it became impassable for wagons, or even mules. The dry gullies became rapid streams, five or six feet deep, and sometimes fifty feet or more across. On this day, a party in coming to the Copper Mines from the plain below, where there had been no rain, found themselves suddenly in a region overflowing with water; so that their progress was arrested, and they were obliged to wait until the flood had subsided. After this we had occasional showers, during the months of July and August.

The weather was not uncomfortably warm any day while I was here; indeed, on several occasions, directly after rains, I found a fire quite agreeable. The party

I left informed me, that early in October it became so cold that fires were necessary every day. The height of the little valley where the mines are was found to be six thousand two hundred and fifty feet above the level of the sea; and the height of the mountain, which rises abruptly from it, and to which the name of Ben Moore has been given, is eight thousand feet. This mountain is the beginning of a range of bold, rocky bluffs of trap, of a grayish hue, which extend some twenty miles to the south, and gradually drop off into the plain. On one side of this bluff, a portion

Cañon leading to the Copper Mines, from the South.

of the rock is separated from the mountain, and stands detached from it like a column. This mountain is a

perfect barrier to a direct road, or even a mule path, across to Mule Spring, making a difference of thirty miles in the distance to Doña Ana. Below the mines the columnar masses crown the summit of the hills and mountains, often appearing like elevated castles. The sides of these mountains are well wooded, as are also the intervening valleys.

Gold is said to have been found here when the mines were worked; and many stories are told of large quantities that were buried when the place was abandoned. About four miles distant, a deep shaft had been sunk, where it was said a skin containing more than five thousand dollars worth of gold had been buried. Several men took their discharge here for the purpose of clearing out the shaft and getting the buried treasure. After several weeks labor, they reached the bottom, and even dug some feet below; but their search was not rewarded with success. This shaft was sunk about seventy feet below the surface. Veins of gold were found, but not sufficient to pay the cost of working; and the spot was abandoned. I saw many fine specimens of lead, and one of silver ore, which were found in the vicinity; but I did not visit the localities. The Mexicans who had formerly resided here assured me that the existence of silver was known to many at the time; but being in the very heart of the Apache country, it could not be worked. The Indian Chiefs also said they would show me where there was plenty of gold, if I would accompany them, but that they would not disclose the secret to others. I told them we did not come to their country for gold, and declined their offer. Whether they

really knew of any or not (and it is my belief that they did), I thought it best not to put myself in their hands, but to maintain the position I had taken from the commencement; namely, that our object was to survey the boundary between the United States and Mexico, the meaning of which they had been made to fully comprehend.

But the great value of the Copper Mine region, which extends from the Gila eastward about fifty miles towards the Rio Grande, is in its fine forests of timber. The principal trees are two species of evergreen oaks; two cedars, one like our red cedar, the other with a berry much larger, and several pines, among them the *Pinus edulis*, or piñon pine. This bears an edible nut, which is a favorite article of food with the Indians. It is quite pleasant to the taste, but is rather small and troublesome to eat. So rich a timbered country does not exist between the Mississippi valley and the Pacific, except in the mountainous district of Upper California. Should a railway be constructed across the country south of the Gila, its timber must be procured from this quarter. The value of pine timber in this region can be appreciated when I state, that there is not a single floor made of boards or plank in the town of El Paso; nor have I ever seen one in any part of New Mexico, Chihuahua, or Sonora. In El Paso, I was obliged to purchase a few hundred feet for doors, tables, and various fittings, for which I paid one hundred and seventy-five dollars a thousand. For building purposes, therefore, this timber would prove immensely valuable.

The buildings at the Copper Mines consist of a

“Presidio” or fort, which commands the approach from the cañon below. It is of a triangular form, each side presenting a front of about 200 feet, with circular towers on the corners. It is built of adobe, with

Presidio at the Copper Mines.

walls from three to four feet in thickness, and a single opening on the eastern side. This building was in so good a state of preservation on the arrival of Colonel Craig, that in a few weeks he built up such walls as had fallen, restored the roof, and made the whole ten-antable for himself and his command, furnishing besides store-rooms for all his provisions. There were also some fifty or more adobe buildings, some of them in good preservation, except the roofs, and others in a state of complete ruin. The adobes were therefore

taken from those in the worst condition to complete the others, roofs were added, and comfortable habitations made for the officers of the commission.

The hills and valleys abound in wild animals and game of various kinds. The black-tail deer (*Cervus lewisii*) and the ordinary species (*C. virginianus*) are very common. On the plains below are antelopes. Bears are more numerous than in any region we have yet been in. The grizzly, black, and brown varieties are all found here; and there was scarcely a day when bear-meat was not served up at some of the messes. The grizzly and brown are the largest, some having been killed which weighed from seven to eight hundred pounds. These are dangerous animals to approach, unless there are several persons in the party well armed; and even then, it is well to have a place of retreat in case of emergency. I have known a grizzly bear to receive twelve rifle or pistol balls before he fell; though in one instance a huge animal was brought down by a single shot from a well-directed rifle, which passing through his entire length, killed him instantly. Turkeys abound in this region of a very large size. Quails too are found here; but they prefer the plains and valleys. While we remained, our men employed in herding the mules and cattle near the Mimbres, often brought us the fine trout of that stream, so that our fare might be called sumptuous in some respects. But it requires something more than meat and game to satisfy the appetite and preserve health and vigor, and we would willingly have exchanged either or all of these luxuries for a few vegetables. We had not tasted a potato for a year,

nor any other vegetables except a little wild asparagus at El Paso. The want of this necessary article of food was therefore sensibly felt, and some of the men began to exhibit symptoms of scurvy. Among the members of the Commission the cases were few and the attacks slight; but the soldiers exhibited twelve or fifteen cases, since leaving the coast, some of them very bad ones. We were well provided with such anti-scorbutics as citric acid, vinegar, pickles, and dried apples; but they did not have the desired effect upon the worst cases, though they doubtless prevented the spread of the disease. Some plants were found by Mr. Thurber, which proved very palatable, and were eaten as long as they lasted with very good effect. Doctor Bigelow, the Surgeon of the Commission, addressed me a letter on the subject of the scurvy, urging upon me the necessity of procuring potatoes. In consequence of this, Colonel Craig and myself sent to Santa Fé, a distance of three hundred miles, for them; but they were not to be had there. With the exception of this disease, the best health was enjoyed by every member of the Commission, during our stay in the region of the Copper Mines. The surveying party on duty on the plain, or desert, as it may with more propriety be called, suffered more on account of the intense heat to which they were exposed, and the frequent want of water. In another respect they were badly off, as it was impossible to take fresh meat with them. My intention was to provide them with sheep, which could obtain a subsistence on the short grass of the plains or near the watering-places; but it was necessary to send to New Mexico for them, and they were not delivered in season.

Unable to send any more parties into the field, in consequence of the non-arrival of Colonel Graham, I determined to make the most of my time by visiting the frontiers of the State of Sonora. In this trip my object was fourfold, viz.:

1. To ascertain from personal examination the condition of the route known as "Cooke's road," from the Rio Grande to the Pacific, and particularly that portion of it leading to the River Gila; in order to determine whether it was practicable to transport by it the provisions needed for the parties engaged in surveying this river.

2. To learn if any, and to what extent, supplies of corn, flour, cattle, sheep, vegetables, &c., could be furnished to the Commission; and on what terms they could be delivered here, or to the engineering parties on the Gila.

3. To induce the people of that State to renew the trade formerly carried on with the Copper Mines.

4. To obtain a supply of anti-scorbutics—*i. e.*, vegetables and fruits, fresh or dry.

The protracted sojourn on the Gila, which the surveying parties must necessarily make, would require so large a supply of provisions, and the risk and expense of transportation by pack-mules would be so great, that I believe it would tend greatly to the advantage of the Commission to convey the supplies as far as possible by wagons. There is no road near the Gila along its whole course, and that point of Cooke's road where it strikes the river (midway between the Copper Mines and its junction with the Colorado) would furnish a good and central location for a *dépôt* of provisions.

Colonel Craig was as desirous as myself to ascertain these facts, and to do all in his power to promote the health and comfort of his men. We accordingly made arrangements to set out on this journey on Friday the 16th May, I having so far recovered as to be able to ride in my carriage, although my wounded arm was still kept in bandages and firmly fastened to my side.

THIRD DIVISION.

JOURNEYS AND INCIDENTS IN SONORA.

CHAPTER X.

THE COPPER MINES TO AGUA PRIETA.

Spring at Pachetehu—Ojo de Vaca—Janos road—Col. Cooke's road—Scarcity of water—Dry bed of a lake—Mirage—Desert region—Zoology of the plains—Guadalupe Pass—Difficulties—Bears—Discover footprints of deserters from Copper Mines—Sycamore trees—Cañon—Luxuriant vegetation—Descend from the great plateau—Change of climate—Ruined hacienda of San Bernardino—Wild cattle—Black Water Creek—Teamster attacked by a bull—Grave of an American deserter.

May 16th. The party for the journey to Sonora consisted of Colonel Craig, with two teams of six mules; Dr. Webb, Messrs. Thurber, Moss, Cremony, Steele, Bausman, Weems, Stewart and myself, also with two teams of six mules. The wagons were nearly empty, containing merely our tents, camp equipage, and provisions. All were mounted on horses or mules except myself; and I would have much preferred the same mode of travelling, but my lame arm forbade it. Even in the carriage the attempt seemed rather hazardous, not knowing what the roads were, or indeed whether

such things existed at all in the interior parts of Sonora.

We did not get off until noon, as it was my intention to go only as far as the first watering-place, called *Pachetehu*,* whither I had sent the wagons in advance to await our arrival. We passed down the cañon in fine spirits, all being glad to get away from the dull monotony of a stationary camp. The country was much parched; for no rain had yet fallen. After leaving the cañon we diverged towards the right, and struck the old road leading to Janos, which had not been passed by a wagon or any train for nearly fourteen years. Yet the ruts were quite distinct on the plain. In fact, some portions of it, where the water had run, were washed out into deep gullies, rendering it impassable for teams. At three o'clock reached *Pachetehu*, a depression in the plain which, in addition to a spring, received the waters after rains. I traced the course of the waters for a couple of miles, marked by rushes and little patches of willows, when it disappeared in the plain. The grass is abundant for some fifteen or twenty rods on each side of this spring and water-course; but there is no wood. Parties must supply themselves with this before leaving the wooded district. Distance from the Copper Mines, thirteen miles.

May 17th. Passed an uncomfortable night from the effects of the jolting on my arm. Roused the cooks at three o'clock; got our breakfast before day; and by the time it was light enough to see, we had re-

* Pronounced Pa-che-te-hú, the last syllable strongly accented.

sumed our journey. Our course continued due south on the Janos* road, over a bare and open plain. Not a tree or shrub was to be seen in any direction; a few straggling yuccas and cacti alone broke the monotony of the plain. Grama grass was abundant, and, though quite dry, and apparently not containing any nourishment, was eagerly eaten by our animals. The country consisted of an undulating prairie, with here and there a solitary hill of a conical form rising from it. In the far distance were visible short and isolated ridges of mountains, with abrupt sides and jagged summits. Passed a yucca of larger size than any we had seen. Its trunk was about ten feet high; from which arose four stems of equal height, all crowned with clusters of white flowers. Reached *Oja de Vaca* (Cow Spring), at half past nine o'clock, distant from our camp nineteen miles; where we turned out the animals to graze. This spring is but a depression in the plain surrounded by a couple of acres of grass, resembling an oasis in a desert. Several holes had been dug here by passing emigrants, in which the water had accumulated; though in some of them it had a disagreeable sulphurous taste. Nevertheless, not knowing how soon another opportunity would present itself, it was thought best to fill our kegs. To the east of this spring are three hills, of which the most easterly one is the highest. The westerly one is crowned with masses of granite. After waiting three hours for the train to come up and the mules to graze, we proceeded on our journey.

* Pronounced Há-nos, the first syllable strongly accented. It is sometimes spelt Yanos.

At this spring, Colonel Cooke's road enters from the east; it then takes a southwesterly course, which we are to follow. The road we have pursued from the Copper Mines continues south to Janos, and thence to Chihuahua. It is the one taken by the California emigrants who come by the way of Santa Fé. It was first opened by Colonel Cooke in his march with his battalion, and train of wagons to California, in the fall of 1846. He took this route by the advice of his guides, though much out of his direct course, in order to strike the old Spanish trail which leads from Janos across a spur of the Sierra Madre, to the frontier settlements in Sonora; because it was known that water was to be found there, at convenient distances. But the more direct route due west from Ojo de Vaca was unexplored; and Leroux, the guide of Colonel Cooke, did not know whether water could be found on it or not. Not wishing, therefore, to hazard the lives of a large body of men by venturing upon an unknown desert, he took the wiser course of striking the old Janos road at the Guadalupe Pass.

Travelling rapidly over an excellent hard road, we reached a pass in a range of hills shortly before sunset, where Colonel Cooke marks down a small watercourse. We were not more fortunate than he was, although there were indications of water in the clumps of bushes, and the numerous doves that were flitting about. Several of the party searched for it up and down for a mile on both sides of the road, but without success. We then passed the hills and encamped on the plain beyond. Passed the grave of a man whom we supposed to be a California emigrant. His name was cut

with a knife on a rude board, supported by a heap of stones. Antelopes were descried in abundance to-day bounding over the plain. Of the feathered tribe, we saw blackbirds, crows, hawks, the Carolina dove, quails, meadow-larks, and a flock of what appeared to be black plover; but as they did not alight, and flew beyond reach of my gun, I was unable to obtain a specimen.

May 18th. We routed the cooks at two o'clock, breakfasted by moonlight, and were on the move before the first dawn of day. There being an uncertainty about water, it was thought best to get over as much ground as possible before the heat of the day. As the road passed over an open plain, with short grama grass and no bushes, and moreover led to a depression in the mountain range, there was no difficulty in keeping it. We continued rapidly down a gradual descent of about twenty miles, with scarcely an undulation. Not a tree or shrub was seen. After passing to the west of a low range of hills, and crossing another plain of about five miles, we entered the defile or cañon, when we reached a spot marked by Colonel Cooke, where he found water for 50 animals. This was a hole in a rock, a few feet to the left of the road, where we found a few buckets of stagnant and brackish water, so bad that most of the animals refused to drink it. The poor creatures having travelled some thirty-six miles since starting, made repeated trials to drink from the uninviting pool before them, and as often turned away in disgust. We rambled over the rocks, and explored the ravines in this defile, where there were many indications of running water, but none could be found.

Again we pushed on, having yet about fifteen miles between us and the first place where there was a certainty of finding water. Continuing a few miles through this defile, which presented no difficulty for our wagons, we emerged on the opposite plain, where our eyes were greeted with the sight of a long white streak, which we would have taken for a lake, had it not been designated by Colonel Cooke, as *Las Playas*, or the dry bed of a lake. Keeping on the same southeasterly course, we still descended; and as the road was very smooth, we set the mules on a trot and rolled over it at a pretty good pace, considering the long distance we had come. At three o'clock we struck the playas, which seemed to have an extent of twenty-five or thirty miles from the north-west to the south-east, the general course of the mountain ranges and valleys in this region. The surface of this dry bed was an indurated clay, so hard that the wheels of our wagons scarcely made an impression. Its color was nearly white. After rains, this basin, being surrounded by high mountains, receives a large amount of water, which seems to evaporate before vegetation gets a foothold. From indications along its margin, and from what I afterwards saw in other places, it never could have contained more than two or three inches of water in its deepest place. The width, where we crossed, was about a mile and a half. As we were midway across, a beautiful mirage suddenly presented itself towards the south, which led us to believe that the further end of the dry surface we were rolling over, was in reality a body of water. Little clumps of bushes arose from it like islands; and the very grass

that grew on its banks was reflected from its imaginary surface.* Some of our party could not be convinced of the illusion, and rode off at full speed to quench the thirst of their panting animals. We hardly knew what course to take here; but seeing some bright green patches amid the vast plain of gray and parched grass, we made directly for it; and great was our joy at finding several large holes, dug by parties who had preceded us, which were filled to the brim with the most delicious water. Near these we encamped.

The country passed over in the last three days is barren and uninteresting in the extreme. As we toiled across these sterile plains, where no tree offered its friendly shade, the sun glowing fiercely, and the wind hot from the parched earth, cracking the lips and burning the eyes, the thought would keep suggesting itself, Is this the land which we have purchased, and are to survey and keep at such a cost? As far as the eye can reach stretches one unbroken waste, barren, wild, and worthless. For fifty-two long

* The well-known phenomenon of the *mirage* is called in Sanscrit "the thirst of the gazelle." All objects appear to float in the air, while their forms are reflected in the lower stratum of the atmosphere. At such times the whole desert resembles a vast lake, whose surface undulates like waves. Palm-trees, cattle, and camels sometimes appear inverted in the horizon. In the French expedition to Egypt, this optical illusion often nearly drove the faint and parched soldiers to distraction. This phenomenon has been observed in all quarters of the world. The ancients were also acquainted with the remarkable refraction of the rays of light in the Libyan Desert. We find mention made in Diodorus Siculus of strange illusive appearances, an African *Fata Morgana*, together with still more extravagant explanations of the conglomeration of the particles of air. *Humboldt. Views of Nature*, p. 137.

miles we have traversed it without finding a drop of water that our suffering beasts would drink; nor has there been grass enough since we left the copper mine region for more than a small number of animals, such as our own.

The few animals noticed seem to have partaken of the wildness of the country they inhabit. An occasional herd of antelopes is seen galloping in the distance, unapproachable by the hunter for the want of a tree or shrub behind which he may advance. Lizards of various hues and graceful shapes glide about with inconceivable swiftness. A startled hare throws up its long ears and bounds out of sight. The prairie dog gives a shrill cry of warning to its fellows, and drops into its burrow. The only things that do not seem terror-stricken are the so-called *horned frogs*. They, as if conscious of the security afforded by their own hideous ugliness, sullenly remove themselves out of the way of the horses' hoofs, and regard the passer with malicious eye. The vegetable presents scarcely more of interest than the animal world. The flowers are almost entirely of that most unbecoming of all hues, yellow—varying from sulphur color to orange—and glaring in the bright sunlight. One becomes sickened and disgusted with the ever-recurring sameness of plain and mountain, plant and living thing. But if the day's travel is tedious, it is almost compensated by the glory of the night. In this clear dry atmosphere, without cloud or haze, moonlight and starlight have a splendor of which dwellers upon the sea-side cannot conceive.

Due north from our camp I noticed a range of lofty

mountains, eighty or a hundred miles distant, extending towards the west, which I suppose to be a continuation of the copper mine range along the Gila. West of this arose another and less distant range. To the south was an uninterrupted plain, with no mountains, or even a hill, visible.

May 19th. The weather was very cold this morning; ice was found in our camp buckets, and we were all glad to wrap our blankets around us. After following the edge of the dry lake for a mile, we came to more springs and water holes, near which the grass was excellent. From here our course was southwest, directly for a pass in the mountains, known as the *Sierra de los Animos*, about seven miles distant. The road was good, the pass presented no difficulties, and we soon reached the plain beyond, where we turned more to the south. Three or four miles brought us to the dry bed of a stream, where we stopped the train, and traced its banks on both sides of the road for more than a mile, without finding water. Before us lay a broad valley, bounded on the west by a range of high mountains; and at some eight or ten miles distance I noticed a dark line of trees, with similar lines intersecting it. This indicated a stream; and four or five miles more brought us to one of its tributaries. But, alas! it was but a dry bed, though fine, large trees, with thick shrubbery, grew along its banks, marking its course for miles. Again we stopped. Dr. Webb took the rocky bed, determined to follow it up, while I, with some others, struck across to a clump of trees near the base of a mountain, the luxuriance of which gave promise of water. In this we

were not disappointed: a walk of a mile brought us to a fine spring, from which a rapid brook dashed over the rocks, dispensing a refreshing coolness, though it entirely disappeared within four hundred yards. The grass being good here, we turned the animals loose, and made a halt of three hours.

On resuming our journey, our course lay across a plain, gradually descending towards a valley intersected by several deep gullies, which led to the dry bed of a stream. We followed this for some distance, but found no water. Crossed two other beds of streams also dry. On our right was a large grove of oaks, which is noted on Colonel Cooke's map; and about four miles after passing this, we struck the source of the stream we had noticed so long on our right, where we found the water standing in large pools. Here we pitched our tents, and encamped for the night, after a journey of thirty-two miles.

May 20th. Another cold morning, with ice in our water buckets. Fires to warm ourselves were quite out of the question, as not a particle of wood was to be seen. For cooking purposes, we generally collected a little where it could be found, and put it into the wagons. Our course to-day was nearly south, over a broad valley, from eight to ten miles across, hemmed in on both sides by high ranges of mountains. So level was this valley, and so luxuriant the grass, that it resembled a vast meadow; yet all its rich verdure seemed wasted, for no animals appeared, except a few antelopes and several dog-towns. In every other instance where the prairie dogs were congregated, it was on the most barren spots, far from water, where

the grass was short, and the soil hard and gravelly. Here the soil was a rich black loam, as it appeared where the little creatures had thrown it up, and the grass was nibbled down to its roots.

After passing a small stream (where we caught some curious water insects), our course lay direct for the mountains, which gradually closed in upon us, until we arrived by an easy ascent at the summit. Here we struck the old road, leading in a southeasterly course to Janos; and here our real difficulties seemed to begin. We had reached what appeared from the plain below to be the apex of the ridge; but we found ourselves all at once surrounded by steep hills, steeper and higher mountains, ravines, gullies, and frightful cañons. A wide and discouraging prospect was open before us. First came an ocean of mountain peaks, if I may so term them; for, from the eminence on which we stood, we overtopped the whole, looking down upon them as in a birds-eye view. Beyond these, looking to the west, arose other mountains, which gradually receded from the view, until in the dim distance the horizon was bounded by a faint blue outline of some range a hundred miles distant. Colonel Cooke deserves great credit for this bold and successful undertaking, which has not been sufficiently appreciated by his countrymen. Here his whole command was employed in opening this trail, and making it passable. But, with all his labor, it is still a most difficult pass, and dangerous for loaded wagons. Although ours were light, it required great caution to get through. The first descent is down a long hill, where the wheels have to be locked. Next the road passes

down a chalky cliff, whose yielding surface crumbles beneath the hoofs of the animals, making it necessary not only to lock, but also to restrain the wagons with ropes. After this it winds over peaks, the declivity always greater than the ascent, until at length the valley is reached. Our progress was slow and toilsome. We were constantly obliged to assist the wagons, by pushing them when going up, or holding back in their descent; but the most dangerous portions were when we had a sideling inclination to contend with; for here the wagons had to be supported on one side, as well as held back. According to Colonel Cooke the descent here is a thousand feet. A perceptible change of climate was indicated by the vegetation: besides the greater abundance of plants peculiar to a warm country, a marked difference was observable in the same species. Those plants which we saw on the table-land just in bud, were, in the course of the descent, seen in flower, and further down with maturing fruit.

Two bears were observed to-day after entering the defile; they were so large as to be taken at first for mules. When their real nature was discovered, several of the horsemen gave chase, but without success; for Bruin gained on them at every leap, and soon disappeared. All the hills and valleys are covered with trees, chiefly live-oak and cedar; and in every open space there is excellent grass.

After four or five hours' hard tugging we reached a small stream, where the road took a sudden turn to the south, leading to a frightful cañon. Here we came to a stand, and waited for the wagons to come up. I

had walked the whole distance through this defile, which is known as the Guadalupe Pass, reaching this point in advance. When all had come up, both men and animals were glad to hear the order to unhitch the mules and encamp for the night, which we did near a small rivulet, though our day's journey could hardly have exceeded twelve miles.

For the last three days we have noticed the tracks of several mules, all of which were shod, accompanied by one man on foot. They appear to have been made several months ago, at a time when the ground was wet; and as there has been no rain, it must have been during the winter after a slight fall of snow. As the Mexicans do not shoe their mules, we believed the party to have been Americans; and a close inspection of the print made by the man on foot convinced Colonel Craig that it was a soldier's shoe, and that the party consisted of the seven deserters from his command who left in February. They took with them but six mules, so that the seventh had to go on foot. We had learned that they had not reached Chihuahua; and as they had not been seen at the settlements on the Rio Grande, the inference was, that they had set out for California. These foot prints therefore were objects of interest to us as we watched them from day to day.

The cañon where we are now encamped, is filled with walnut, oak, ash, and sycamore trees. The last mentioned, is quite a different tree from that known by the same name in the United States, and, if it would bear our northern winters, would make a fine addition to our ornamental trees. Its leaves have a graceful droop, the bark is almost pure white, very clear and

smooth, and contrasts strongly with the foliage. The fruit instead of being a solitary head, or "button ball," like ours, is borne in large clusters of three or five, strung upon a slender stem. The banks which overhang this defile are steep and rugged, and present as great a variety of plants of the cactus family, as the valley does of trees and shrubs. Besides the various kinds seen on the plains, new ones were noticed here, nearly all of them in flower. The beautiful yucca raised its tall stems of white flowers, while the agave towering above all, with its brilliant yellow blossoms, completed the floral array of this wild and romantic pass. Fatigued as I was with my hard day's walk, and my arm still bound to my side, I did not wait for dinner, but clambered up the bank, and seating myself beneath the shade of a cedar, took two sketches of the place, one of which looking south exhibits a singularly capped rock, standing detached in the cañon.

May 21st. A great change in the temperature of the air, has accompanied our descent from the high plains. The little stream on which we are encamped flows west; so that it is now evident we have crossed the great dividing ridge, or central plateau which extends from north to south across the whole continent of North America.

Closely hemmed in on both sides by overhanging rocks, our route continued along the cañon for five or six miles, directly in, or near the bed of the stream, each turn presenting some new scene of beauty and grandeur. Tall sycamores filled the narrow space between the walls of the defile, while flowering shrubs shooting their slender branches from the recesses where

a little earth had given them a hold, formed a complete canopy over our heads. The various cacti, the agave, and the yucca also abounded, each flourishing in perfection, and, as it were, striving for the ascendancy. To these must be added the *fouquiera*, with its tall leafless stems and its brilliant scarlet flowers, which shot forth from every rocky crevice.

On emerging from the cañon our road led up a high hill where there was a level plateau, of a desert-like character, about eight miles across, with an excellent road, which brought us to the rich valley of San Bernardino. Here was stretched out before us a level patch of green, resembling a luxuriant meadow, some eight or ten miles long, by one broad; and directly beyond, on a little spur of the plateau, lay the ruins of the hacienda of San Bernardino. Crossing this valley we stopped on the banks of a little stream, a tributary, or one of the sources of the Huaqui, which passes within a few rods of the ruins. As we approached, a flock of herons arose from the water, alarmed at the unusual invasion of their quiet haunt. One of them, whom curiosity had prompted to leave his companions and take a closer inspection of the intruders, fell a victim to his boldness, and was added to our ornithological collection.

San Bernardino is a collection of adobe buildings in a ruined state, of which nothing but the walls remain. One of these buildings was about one hundred feet square, with a court in the centre; and adjoining it were others with small apartments. The latter were doubtless the dwellings of the peons and herdsmen. The whole extending over a space of about two acres,

was inclosed with a high wall of adobe, with regular bastions for defence. Being elevated some twenty or thirty feet above the valley, this hacienda commands a fine view of the country around. Vast herds of cattle were formerly raised here, but the frequent attacks of the Apaches led to the abandonment of the place. Some cattle which had strayed away and were not recovered at the time, have greatly multiplied since, and now roam over the plains and in the valleys, as wild and more fierce than the buffalo. Colonel Cooke, in his march to California, supplied his whole command with beef from these herds; and the passing emigrants destined for that country, replenish their stores from the same source. I saw a number of these cattle when riding in advance of the party, but having only my double-barrelled gun and my revolvers with me, did not dare to shoot at them. These herds were small, not more than six in each, led by a stately bull. A wounded bull would be a serious antagonist, more so, I have been told than a buffalo. This establishment was abandoned about twenty years ago; since which time, no attempt has been made to reoccupy it. Such seems to be the case with all deserted places here; a fatality or superstitious dread hangs over them, and when they have been left two or three years, they are not again inhabited.

After watering our animals, and giving them a couple of hours to feed on the rich grass here, we resumed our journey, taking a westerly direction. The road first entered a thick chapporal of mezquit through which it continued four or five miles; when we struck for three mountains, in a line with each other from

east to west; the last of a conical form, crowned by a perpendicular mass of reddish rock, covered with green and yellow moss. Here the country was exceedingly hilly and barren. For two or three miles the vegetation was limited to a perfect forest of the *fouquieras*; some of which grow to the height of twenty feet, their leafless stems crowned with scarlet flowers. I would have remained at San Bernardino for the night, but expected to find water at the base of these hills, as indicated by Colonel Cooke. We saw many places where there had been water, and even a running stream; but all was dried up, and there was no alternative but to push on some twelve or fourteen miles to Black Water Creek, the *Agua Prieta* of the Mexicans. Emerging from the hills we came upon an open plain with an excellent road down a gradual descent for about ten miles; and seeing before us the bottom of the valley, with a line of bushes which I supposed to mark the stream we were in search of, I hurried on in advance of the wagons, in order to select a good place for an encampment. A couple of hours brought me to the spot, where to my great disappointment, I found only a dry ravine without a drop of water; nor did it appear that there had been any there for months. Rank grass and weeds had sprung up in the bed where water had run, had come to maturity, and shrunk away for the want of further nourishment. Not a tree was near us, and every thing around had a most forbidding aspect. For a mile before reaching this watercourse, we had noticed many well-beaten trails of wild cattle, some of which were quite fresh, and directed towards a common centre.

A few miles in advance, following the road, I also perceived a line of large cotton-woods. I hastened forward in advance of the party, and when I reached the spot, I directed Wells, my carriage driver, to look around among the trees and bushes, whose luxuriance indicated their proximity to water. He had got but a few rods when I heard him halloa, and soon after take to a tree. His red flannel shirt had excited the ire of a bull, which, with a herd of wild cattle, was browsing among the bushes. But my party coming up at this juncture, they all took to their heels in single file, the bull leading the van, and were soon lost in the high chapporal. We were again doomed to disappointment. No water was found. I now hastened back with all speed to Black Water Creek, where the train with the rest of the party had arrived. They were pondering what to do in the dilemma. Their disappointment being not less than my own. We had now come about twenty-two miles from the last water, and nearly forty from our last camping place in the Guadalupe Pass. So confident had we been on leaving San Bernardino that we should find water at this place, if not at two intermediate stations, that we had not taken the trouble to fill our kegs. We always avoided carrying kegs of water when not absolutely necessary, on account of the weight, and the appearance of a river on the map was a sufficient excuse for omitting to do so at this time. For the same reason we had collected no wood. The place where we had stopped was also entirely destitute of grass, so that we had but a poor prospect of a meal before us. Two of us had a little water in our canteens; we put this together, made a

fire with some buffalo chips, *i. e.*, dried cattle dung, and made a pot of coffee. It was now quite dark, and too late to look further for water. The mules were, therefore, fastened to the wagon wheels, and tongues, without food; when we, all fatigued and supperless; threw our blankets around us, and without pitching our tents, crept beneath the wagons, and tried to forget our unpleasant situation in sleep. The bellowing of bulls and the incessant yelping of the wolves occasionally disturbed our slumbers; nevertheless, we obtained a refreshing night's repose.

Among the incidents of the day, the following deserves mention. Shortly before we stopped the attention of the party was attracted by a glittering object, a few rods from the road. On examination it proved to be a highly polished bayonet; and Colonel Craig immediately recognized it as belonging to a U. S. army musket. Further search disclosed a grave, which appeared to have been scratched open by the wolves, and the body carried off. A pair of soldier's pantaloons, and part of a cotton sheet were also found near. There was every reason to believe, therefore, that this was the grave of an American soldier, and probably of one of those who had deserted from the Copper Mines.

While jogging along to-day, a wolf passed by, which I shot from my carriage door. Many antelopes were also seen, but we were in too great a hurry to go in pursuit of them. For the same reason none of the wild cattle were shot.

May 22d. As soon as it was light, Colonel Craig, Mr. Thurber, and others set off in search of water. They took one of the fresh cattle trails; and, after following

it about two miles, they struck a fine spring, which we afterwards learned was known to the Mexicans by the name of *Agua Prieta*, or Black Water. To this place we immediately moved the wagons, and encamped for the day.

CHAPTER XI.

AGUA PRIETA TO ARISPE.

Leave the California road—Agua Prieta—Send party to look for Fronteras—Mexican soldiers sent to guide us in—Journey resumed—Strike a rich valley—Break a wagon—Reach Fronteras—Description of the place—Abandoned by its people and recolonized—General Carrasco—Couriers between the frontier posts—Attack by General Carrasco on Apaches at Janos—Campaign against the Apaches—General Carrasco's opinion of American officers—The Doctor beset by the sick—Leave Fronteras—Coquiáachi—Valley of Barbari—Wild turkeys—Mountain Pass—Gold Mine—Bacuachi—Sonora River—Magnificent cañon—Chinapi—Curious sandstone formation—Arrival at Arispe.

WE had now reached the farthest point to which we could follow the California road; our destination being Fronteras, the nearest town in Sonora, which is laid down on Cooke's map as about fourteen miles to the south, we must leave it here. But as no wagon road or trail could be discovered in that direction, I did not think it prudent to set off with our wagons without knowing more about the country. Colonel Cooke does not speak positively as to the distance of this place, having obtained his information from an Indian. I therefore despatched Messrs. Thurber, Cremony, and Stewart to find the place, and ascertain if the country between it and our camp was practicable for wagons. They took with them as guide a Mexican, named

Jesus, one of our teamsters, who had visited the place some years before by another route, and knew the landmarks. This name is so common among Mexicans, particularly the lower classes, that one can seldom get half a dozen of them together without finding a Jesus in the company. We had two of the name in the Commission for a year; both of whom, I am sorry to say, proved entirely unworthy of it.

Remained quietly in our tents during the day, the mules and horses feeding on the grass near by. Parties went out in search of wild cattle, many having been seen at daylight; but they all returned unsuccessful. For lack of better sport, therefore, we amused ourselves in firing at wolves which constantly approached the spring during the day; only one however was killed. During the night heard the bellowing of bulls in all directions. Several of our men were on the alert, but the cattle doubtless scented the danger, and would not approach.

May 23d. At 6 o'clock this morning we espied four strange looking figures dressed in white, approaching the camp on a run, which my glass showed to be Mexicans. They proved to be a party from Fronteras, sent by General Carrasco, the officer in command; they had left the night before at 8 o'clock, and brought letters from the General and from Mr. Thurber, who, with his party had reached there in safety. General C. extended the hospitalities of the place to us, and sent the four soldiers to be our guides. Mr. Thurber wrote that his party had taken a southerly direction across arroyos and through a dense chapporal, starting up numbers of wild cattle, until near sun-

set, when they came in sight of the town. On drawing near they observed the greatest commotion in the place; people were crowding in front of the church, and upon the house tops, and the steep street which led to the plaza, was thronged with women and children. Their approach had been observed by the sentinel on guard. He, supposing them to be Apaches, gave the alarm; and the consequence was, a general turn out to repel the supposed attack. When the mistake was corrected, their fear of the Apaches gave place to wonder at *los Americanos*, these being the first specimens of the Yankee nation that many of the people had ever seen.

We now hurried in the mules, and, rapidly completing our preparation for the start, were off by 10 o'clock. Our course lay south towards the western point of a high mountain. Our guides led us along a valley through which ran the stream called Black Water Creek,—that is to say, when there was water enough in it to run. We found it here and there in pools. The country was flat, and covered with luxuriant grass, resembling a meadow. Our course was slow, being much impeded by deep gullies, some of which had to be cut down to let the wagons cross. In passing one, where the bank was short and steep, the hounds of one of Colonel Craig's wagons were broken off. It was feared that we should be obliged to abandon the vehicle; but thanks to the ingenuity of my carriage driver, who spliced it with a crotched tree, we were able to proceed after a couple of hours' delay. These short and sudden plunges are more dangerous than long or even steep hills, and require the utmost

care in passing them. The tongues and hounds are liable to snap off; and nothing so completely disables a wagon as an accident of this kind. As we proceeded, the valley became more picturesque, being covered at intervals with mezquit trees, larger than any we had seen. In the afternoon we were again brought to a stand, and on turning to ascertain the cause, found that one of the tires of Colonel Craig's wagon had fallen off. This was repaired in half an hour by lashing it on with halter chains. As we approached the mountain, we found ourselves in a valley still more luxuriant, having a beautiful stream winding through it, overhung with walnut, ash, and cotton-wood trees. Finding it imposible after our delay to reach Fronteras to-day, we stopped at five o'clock near a fine grove, on the banks of the stream, where there was excellent water and an abundance of grass, and there pitched our tents for the night.

May 24th. At six o'clock we were off, keeping in the valley and following the stream which led around the western extremity of the mountain called Covayan. Our course still continuing south, we struck across an elevation, and entered the valley beyond, here covered with large cotton-wood trees. The road now continued level; and after a ride of four hours, we reached Fronteras. As we approached, men, women, and children came out to meet us, ours being the first American wagons that had ever been seen in the place. General Carrasco met me as I alighted from my carriage, and took me to his quarters.

Fronteras was formerly a town of considerable importance. It was established about eighty years ago

as a *presidio*, or garrison, and at one time contained two thousand inhabitants. The view of this town from a distance is pleasing. It stands upon a point of table land, which juts out into the valley like a promontory

Fronteras, Sonora,

in the sea. The church forms the prominent object in the landscape, and its style is quite picturesque; its effect also is heightened by its somewhat ruined condition. Along the steep sides of the hill, the houses are placed, rising one above another, which makes the place appear much larger than it really is. Once within the town, one's ideas of the picturesque are soon dissipated by the sight of its ruined adobe buildings; though he soon forgets the desolation around him in looking

upon the green fertile valley spread at his feet. Fronteras, like most of the military colonies, fell into decay, chiefly from the neglect of the central government to properly provide for the soldiery, in consequence of which, the inhabitants were left without protection from the attacks of the savages. To such an extent did the place suffer from the incursions of the Apaches, who killed off the herdsmen, drove the cultivators from the fields, and took captive the women and children, that about three years ago it was entirely abandoned. Within six months General Carrasco has re-established the colony, a new population, including many of its former inhabitants, have taken possession, and in many respects it appears like an old settled town. Acequias have also been opened, large fields of wheat and corn cover the beautiful valley, numerous cattle graze on the meadows, and the importance which the place once enjoyed seems about to return.

Fronteras is supported by a valley two miles in width, which we entered about six miles from the town. This space of arable land, limited as it is, is said to be one of the largest and best in Sonora. The soil is exceedingly rich, and is capable of producing abundant crops of maize and wheat (the only cereals cultivated), fruits of various sorts, and, with pains, every kind of vegetables. But here, as in all other parts of Mexico that I have seen, this species of culture is but little attended to. Beans, pumpkins, and onions are raised, it is true, but all other vegetables are unknown.

A small stream passes by Fronteras, which, although called a river, would scarcely be characterized as a creek in the United States; but all the streams here are

very small. This river winds its way through mountains, and occasionally expands, forming a valley or bottom covered with rank grass and luxuriant foliage. It is here called Fronteras River, and like many other streams in the country, changes its name with the towns it passes. Lower down it is called the Sonora River, by which name I shall speak of it in future.

General Carrasco is at present in command of all the troops on this frontier. He has increased the number of posts, and keeps up a weekly communication between them all by means of couriers, two of which, armed with musket and lance, traverse the broad deserts, eluding the Apaches, who are lying in wait for all small parties of travellers. They perform most of their journeys at night, and generally go on a trot, by which means they accomplish nearly as much in a given time as a horse. War in the field does not succeed against Indians, for unless they feel strong enough to overcome their foe at once, and with little loss, they retire and are not to be found. The General has determined to carry the war into their very fastnesses, and to make it one of extermination. If his troops were equal to their commander, the Apaches might have cause of fear. He lately made a successful descent upon the Indians at Janos. This place is in the State of Chihuahua, which is at peace with the Indians, and whose government serves them with rations. Taking advantage of this, they carry their predatory excursions into the State of Sonora, and run off large numbers of mules and horses, which they take to the frontier towns of Chihuahua and sell. General Carrasco, being informed of this, disregarded the State limits, and came suddenly upon the town of

Janos, near which he found a body of Indians, whom he attacked and routed. Some twenty men were killed, and fifty or sixty, chiefly women and children, were taken prisoners. These were sent into the interior, and there distributed among the haciendas and ranchos as servants, too far off ever to reach their homes again. The military commander, Colonel Medina, was much enraged at the proceedings of the Sonorian General in invading his territory, and reported the case to the central government, which, however, approved of Carrasco's course.

When we entered the town, the General was just preparing to set out on a campaign against the Indians on the Gila; and his troops, nearly four hundred in all, were assembling in front of the town. There were three companies of infantry and one of horse. Some were dressed in blue great coats and high caps, and others in short jackets, while all wore the common loose white cotton drawers and shirts of the country. Many sported broad-brimmed glazed hats, with a white band, while the hats of others were of straw; but in all cases these coverings were stuck on the top of the head, and tied under the chin. Every variety of costume seemed admissible; and the only point in which they all agreed was in being exceedingly dirty. There was scarcely a pair of shoes among them, the substitute being sandals of raw hide, fastened with thongs of the same material. The officers in this corps, several of whom I learned were from the city of Mexico, appeared to be intelligent men. They were well dressed, and exhibited a striking contrast with the privates. I also noticed among

the non-commissioned officers a sergeant, who was an Apache Indian. This man had long been in the Mexican service, where he was well treated. He exhibited much intelligence, and being familiar with the haunts of his people, was to guide the Mexican soldiers in their campaign.

The camp equipage and simple fare of these soldiers presents a striking contrast with what an American brigade would deem necessary. Each man, besides his musket, forty rounds of ammunition, and a blanket, carries rations for six days, the daily ration consisting of two pounds of pinole (coarse wheat or Indiana meal); half a pound of dried beef, and half a pound of panoche, the coarse brown sugar of the country. The beef is cooked on the coals before starting, and the pinole requires no other preparation than stirring with water, and sweetening with panoche. Cooking utensils are, therefore, unnecessary, and a tin or coarse earthen cup is all that is required. Every man carries a sheath or jack-knife; and even this may be dispensed with, for the meat is dried in long strips, and pulled to pieces with the teeth and fingers. Besides what these soldiers carried, there were some sixty pack mules, laden with camp equipage for the officers, tents, ammunition, provisions, and corn, a very small train for a body of four hundred men, about to traverse a desert country, where no supplies could be procured.

The inhabitants just now are very poor, as they have not yet begun to realize any thing from their crops. Estimating their returns at the usual rate, they expect to obtain about twelve thousand bushels of corn and wheat the coming harvest. For their pre-

sent subsistence they rely entirely upon dried meat from the wild cattle, and pinole. Not a particle of coffee, chocolate, or rice was to be obtained in the place. On my making known to General Carrasco that I wished to purchase some beef and corn, he ordered an ox to be killed and sent to our camp in the morning, together with a bale containing a hundred pounds of dried beef, and eight or ten bags of corn, for none of which would he receive any pay. During the hour or two spent at his quarters he entered into a warm discussion with Colonel Craig on the battles in which the Mexican and American armies had been engaged in the late war, in several of which he had participated, and respecting all of which he was very well informed. He seemed to understand well the qualities of our general officers, and expressed the most unbounded admiration for several, particularly the Commander-in-Chief. He did not approve of the plan of making General Scott President; but said the United States should present him with three millions of dollars, and give him the mission to England or France.

Our camp was below the hill, about a quarter of a mile from the town, beneath the branches of a gigantic cotton-wood. Here we were detained four days, to make the necessary repairs on Colonel Craig's wagons. The first day little was done. The next being Sunday, the mechanics would not work at all, even with promises of large pay; yet they sang, and danced, and drank aguardiente all the afternoon and evening. On Monday our men took hold of the job, and by Tuesday night the wagons were in readiness

to move. The people of the place, for want of other employment, hung about our camp from morning to night, though the cooking department seemed to possess the greatest attraction for them. Men, women, and children crowded around the presiding functionary, for the double purpose of cultivating a knowledge of the culinary art and of picking up such scraps as he thought proper to bestow upon them. Their own cooking is all done in earthen vessels; and the abundance of iron utensils with which we were furnished seemed to impress them with the idea of our great wealth. The doctor, too, was beset by these people. Their complaints were chiefly diseases of the eyes, and such others as result from improper food and unclean habits. The doctor accompanied his medicine with a lecture on that virtue which ranks next to godliness, and the necessity of employing their time in industrial pursuits, and of obtaining by their own energies the comforts they so much need. He prescribed and gave a small quantity of rice to a sick woman, and soon found that nearly all her sisterhood in the place stood in need of similar aliment.

I found many of these people quite desirous to emigrate to the Copper Mines; and they earnestly begged permission to accompany me back. Some fourteen years before, when the mines were worked, a considerable trade between here and that place was carried on, which, if we maintained a post there, would probably be resumed.

It is difficult to make the people of this place believe that we are not a party of traders; and every hour in the day we have calls to sell needles, thread,

and a hundred little articles. They seem different in many respects from those of the towns on the Rio Grande, where contact with the Americans has had its effect (would that I could say for good) upon the Mexicans. Their manners and habits of living are more simple, and their hospitality more warm and generous, though with much less means for its display. We observe that the *olla*, or earthen pot, which is almost their only domestic utensil, is different and better finished than that of El Paso. They are also borne differently when used as water-jars; those of El Paso being carried on the shoulder, and supported by one hand, while the women here, without exception, walk with a firm step and erect figure, with these frail vessels, frequently containing four or five gallons of water, balanced upon their heads.

The morning before we left, a wild bull was brought to us. These animals are pursued by the Mexicans on horseback, caught by a lariat, and thrown. They are then secured by the horns, the tips of which are first sawed off, to a domesticated animal; and thus tied, they come along quietly enough. We selected such portions of this animal as we wanted; and the remainder, including the head and offal, was eagerly seized upon by the people, who had been watching the process of butchering with as much delight as the starving wolf or buzzard does a perishing mule.

May 28th. Took our departure at seven o'clock, and at a short distance passed the first way-side cross. Though we met them frequently enough afterwards, we saw none as striking as this. It was about ten

feet high, covered with evergreen, and supported at the base by a large mound of loose stones. Usually, these crosses are simply two rough sticks bound together in the form of the sacred emblem; though some we saw were constructed with more care, and had inscriptions carved on them. They mark the places where travellers have been murdered by the Apaches.

About six miles from Fronteras we passed a small stream running through a little valley, on the opposite side of which, on the edge of the plateau, stood the deserted village of *Cocuiârachi*. The fields that skirted the roads, the rows of pomegranate trees in full bloom, and the orchards of peach, pear, and mulberry, all betokened a high state of cultivation. We halted a few moments at the place, and entered many of its tenantless houses, which are fast falling to ruin. The church was in good condition; for the savages, though they often burn and destroy the habitations of the people, always spare their places of worship. It was indeed sad to see such desolation, where but a few years before there had been so much happiness. On leaving this place we ascended a long and very steep hill, to accomplish which we had to double our teams. Continuing on the plateau for six or eight miles, we again descended into a pleasant valley, called *Barbabi*, thickly covered with oaks. As we were moving along through these, a flock of wild turkeys flew up, from which one of the party dropped a fine large one with a pistol shot. Having now made twenty miles, and finding ourselves in one of the most romantic spots we had yet seen, with fine grass and

water at hand, we pitched our tents beneath some oaks and rested for the night. We were in a complete amphitheatre of low rounded hills, all covered with trees, with a high and rugged mountain on the south. Taking it altogether, I had seen nothing that reminded me so strongly of the scenery of Vermont and New Hampshire. Near the little brook where we encamped were some wild currant bushes, from which we gathered an abundance of fine fruit. These made into a sauce, and added to our turkey, furnished us such a supper as does not often fall to the lot of travellers. A deer, too, was killed, which was laid aside for the morrow. This valley, owing to its seclusion, is considered one of the most dangerous places in the country, a hundred persons having been murdered here within the last two years.

May 29th. Owing to the great heat during the middle of the day, I determined to set off early. By daybreak, therefore, we were under way, and soon after entered a mountain pass or cañon, which proved to be exceedingly difficult for our animals. So long and steep were the ascents, that at each of them we were obliged to double the teams, and at every descent to chain the wheels. The valleys and mountain sides were covered with oaks, while the summits, as far as I could judge, were covered with pines. The whole country during the night had been on fire, including the mountain; so that every thing around us was now black and gloomy. One of Colonel Craig's wagons again broke in this defile, causing a delay of several hours. These mountains are said to contain gold, and we were told that "lumps," in comparison with which

those of California are but gravel stones, could be had for the picking up. Our Mexican guide told us that he had obtained a thousand dollars there in one week; and we afterwards learned that the placers had really been worked with great results, but the frequent inroads of the Apaches had caused them to be abandoned. After leaving the cañon, our course lay south-east over a pleasant and well-wooded country of oak, ash, and mezquit. The latter increases much in size as we proceed south. Reached a small running stream, when a beautiful valley a mile in width opened upon us, with luxuriant fields of wheat, corn, and pease. It was intersected by a broad acequia, the course of which was marked for a mile or more by a line of cotton-woods and willows. At the western extremity of this valley, on a spur of the plateau, stood the village of *Bacuachi*. This is a peculiarity of all Mexican towns on the frontier. Farmers do not build their ranchos or houses on their arable lands, but congregate on the desert tableland, elevated from thirty to a hundred feet above the adjacent valley from which they derive their subsistence. The great end of security is thus attained at the sacrifice of all comfort and convenience; no trees or shrubbery grow about the houses, nor is a blade of grass to be seen, but a glaring reflection from the light, gravelly soil strikes the eye, which is doubtless one cause of so many diseases of that organ. A house surrounded by foliage with a grassy lawn, which makes a country residence so attractive, even though it be but a humble cottage, is unknown here. Indeed these people at present know not what comfort is; but with their rich soil and the advantages of irrigation, a

few years only of peace and safety would be required to make these beautiful valleys the most charming abodes imaginable.

We did not stop in the village, but drove on to the banks of the stream which ran at the foot of the hill beyond, and there encamped. The inhabitants, who had been in great consternation, came rushing down the hill towards our camp, greatly relieved at ascertaining our peaceable character.

After arranging the camp we strolled up to the village, which turned out to be a truly miserable place. Though once prosperous, it is now nearly depopulated. It is surrounded by an adobe wall about five feet in height, intended doubtless as an inclosure for cattle, rather than as a work of defence. The houses were mostly in a dilapidated state, and the church itself was roofless, though a few branches of trees had been laid from wall to wall to keep the sun from the heads of the devout. But if the church was suffered to become a ruin, the good people had taken care of certain noisy appendages, without which they could not realize that they worshipped their Creator. Near their church they had suspended from a beam by thongs of raw hide, resting on two forked sticks, three fine old Spanish bells, one of them bearing the date of 1695, the other of 1721.

Our visit attracted much attention, and we were soon surrounded by groups of the inhabitants, eager to know who we were and what had brought us to this secluded spot. I inquired for the alcalde, and on being conducted to him, exhibited my letters from Generals Condé and Carrasco, which quieted all fears.

We were invited to take a seat upon an adobe projection, a cool though rather hard substitute for a settee, whereupon we entered into conversation with the alcalde, and groups of inquisitive followers. Indian depredations formed the sole topic of our conversation; and much surprise was expressed at our boldness in venturing so far with so small a party. In such constant fear do these people live, that I found it impossible to hire two men to take out our mules to a meadow half a mile from the village. At length I addressed to the authorities a formal demand for two herdsmen; this was complied with, and two men soon after appeared, armed to the teeth. But by this time we had made arrangements to have some green wheat cut and brought to the camp, which enabled us to dispense with the grazing. By scouring the town we succeeded in purchasing three dozen eggs, the entire stock on hand. American coin would not pass. We offered in pay both half dollars and gold half eagles; but they shook their heads. To my question, "Is it not good gold and silver?" I received the universal reply of "*Quien sabe?*" Who knows? Fortunately we had a few Mexican dollars, which we were obliged to change for the *joles*, or copper coin of the State, 128 of which make a dollar.

On returning to camp, we found it full of people; and it was with difficulty that the cooks could prepare our meal for the crowd of wondering spectators that surrounded the fires. I thought I had seen human wretchedness in its worst state, but here was a lower depth. A more degraded, filthy, destitute population than this, can hardly exist. Their number is about

one thousand. Distance travelled to-day, twenty-one miles.

May 30th. Soon after leaving Bacuachi, we turned from the valley and took the bed of the Sonora River. The mountains here approach so close together that the river has barely washed its passage through, and no valley or bottom is again seen for many miles. We entered this cañon by the bed of the river, which is but a few inches deep, crossing and recrossing it a hundred times during the day's journey. Sometimes for miles we were so closely hemmed in by the perpendicular sides of this extraordinary defile, which rose six or eight hundred feet above on either hand, that we could not see a hundred yards before or behind us; and at other places, the dense foliage which sprung up from little islands, hung like a canopy over our heads. The whole course of the river through this cañon affords a series of most delightful scenes; and the first few miles of the ride through it will long be remembered by those who enjoyed it, as the most beautiful portion of our route. The rocks through which the stream has forced its way, exhibited the most picturesque and fantastic forms. Columns, turrets, towers and pyramids, as nature made them, decked with brilliant flowers or bearing strange cacti, appeared at every turn. From projecting ledges sprung the yucca and agave, where there seemed scarcely soil enough to give them a foothold. The air was filled with a delicious perfume from the grape and mellilot; and birds of brilliant plumage and sweetest song flitted across our path.

It will hardly be necessary for me to remark, that

there is no wagon road here, nor have we seen one since we left the California road at *Agua prieta*. The country admits of nothing but mule paths; and what little transportation there is, is carried on the backs of mules. Yet, with a guide, we managed to push our way with my carriage and six mule wagons through this defile, by cutting away the bushes and following the bed of the stream. Had there been any falls in this perpendicular cañon, we should have been in a sad predicament; but fortunately the descent of the river was very gentle, creating only a slight ripple here and there. Deer and turkeys were frequently seen, but there were so many places of concealment, that on the first alarm they eluded our search, and none were killed. After leaving the cañon a valley opened upon us, still hemmed in by mountains; this we followed about nine miles, and encamped near a cluster of adobe houses, which bears the name of Chinapi. Distance travelled about twenty-two miles.

Just before reaching this place we met some Mexicans, from whom we inquired the distance. Wishing also to obtain some information relative to the products and population of the country, we asked, "How many people are there in Chinapi?" The reply was, "*Bastante*," Enough. "How many are enough?" "*Quien sabe?*" Who knows? In my intercourse and journeyings with the lower class of Mexicans, these same replies have been given to me a hundred times. Had I asked if the place contained five hundred people, the answer would probably have been, "*Quisas*," Perhaps. But when they don't know what to answer, the universal reply is, "*Quien sabe*." The proper expression, "*No se*,"

I do not know, is rarely heard, even among intelligent people, so habituated have they all become to the other form.

One of the sandstone formations which lay directly by our path, after we had left the cañon and were journeying along the valley, presented so singular an appearance, that I made a hasty sketch of it as I passed. The three columnar masses are about fifty feet in height. A small stream flows directly at their base, where there is a dam to raise the water and direct it into an acequia which irrigates the valley around.

Columnar Rocks near Arispe.

May 31st. Our route continued along the bed of the river for about ten miles, the valley widening as we advanced and becoming more cultivated, when at

length we reached *Arispe* and encamped in the Alameda, a beautiful park about a thousand feet in length. As soon as our tents were pitched, Colonel Craig and Mr. Cremony took my letters, and went up into the town to pay their respects to Colonel Garcia the commanding officer. Several officers soon after called on

Arispe, Sonora.

me and invited myself and party to dinner at 5 o'clock. The invitation was accepted by Colonel Craig, four gentlemen of the Commission and myself. The Padre and several prominent citizens were present, and an elegant dinner was set before us, particularly rich in fruit and vegetables, for which we felt a great craving.

CHAPTER XII.

FROM ARISPE BACK TO THE COPPER MINES.

Description of Arispe—Primitive church service—Scarcity of grain and fruit and abundance of vegetables—Set out on our return—Broken down wagon abandoned—Reach Fronteras—A blacksmith's independence—Celebration of a Saint's day—Manufacture of aguardiente—Various uses of the Maguay—Doctor's fees—Broken wagon metamorphosed into a cart—Sorry plight of a wild bull—Strike Cooke's road—Traces of fire in the Guadalupe Pass—Mexican encampment—Story of Americans attacked by Apaches—Reach the Copper Mines—Colonel Graham not arrived—Visit General Condé's camp and consult with Lieutenant Whipple—Return to the Copper Mines.

ARISPE was formerly the capital of the State of Sonora; but becoming involved in the civil wars which distracted that State in 1828, the seat of government was in 1832 removed to Ures, where it now remains. In the time of its prosperity, it is said to have contained a population of five thousand inhabitants; but the civil discords and the encroachments of the Indians have reduced it to less than fifteen hundred. The buildings are far superior to any we have seen among the Mexicans, and particularly to those of El Paso. The majority are built of adobe, though there are many of stone. They are all higher than any we have observed elsewhere, and are capped with a projection of brick,

besides having a variety of architectural ornaments sufficient to impress one with the former wealth of the place and taste of its people. It is indeed melancholy, to walk through its deserted streets, and see its dilapidated tenements, neglected courts, and closed stores. The only building of particular interest is the church, which was once a fine edifice, but is now fast falling to decay. Its interior is of unpleasing proportions, its length, as in most churches of the frontier where large timber cannot be procured, being too great for its breadth. It contains some fine pictures among the hundred or more that are suspended from its walls. They are all in beautifully carved frames richly gilt; but both pictures and frames are suffering from neglect. The altar is covered with massive plates of embossed silver, and there is a profusion of this metal displayed in the shape of massive flower vases, chandeliers, censers, etc. We attended mass, and found the church filled almost exclusively with women. The music was performed by a band in which clarionets predominated, and we recognized among the tunes several of our popular Ethiopian airs, such as "Dearest May." The singing was performed by two girls, who seemed to have perfected themselves in the art under the tuition of the Chinese.

We find the same scarcity of provisions here as in the other towns we have stopped at, and that it will be impossible to procure any fruits, or vegetables with which to load our teams; at least there are none that admit of transportation. It is not the season for oranges, lemons, pomegranates, or grapes, and we find that there is no dried fruit of any kind. The more sub-

stantial articles of food are also scarce and high. Corn is nine dollars the fanega of two and a half bushels, wheat seven dollars, and other articles proportionably high. The reason given for the scarcity is, that for two years past such numbers have emigrated to California that scarcely enough was raised for the consumption of the people. This year they are returning to their senses and their homes, and there is every prospect of an abundance in the fall. The few stores in the place are miserably furnished, their stocks being chiefly dry goods suited to the Mexican market. The only redeeming feature of the place is its gardens; these were evidently established in days of prosperity, and some few are still in tolerable keeping. We passed several hours in strolling through them. Lofty palms lift up their heads of fan-like leaves above the groves of pomegranates, oranges, and lemons. We found apricots in perfection, and the apple, pear, peach, and quince trees full of promise. The quince is said to be the best known in the world, and eatable without cooking. We enjoy here what we have been so long strangers to—fresh vegetables; and from the quantity of peas, beans, etc., consumed by our little party, one would suppose they were storing up a preventive against the scurvy for a year to come. Water is carried about the streets in bags of raw hide. These have a hole at the bottom, and into it a horn is inserted point downwards, which acts as a valve. Two of these bags are slung upon the back of a donkey.

During our stay of three days at this place we received much attention from the officers as well as from several of the citizens. The better class of Mexi-

cans, particularly those of pure Castilian blood, are every where noted for their courteous manners and hospitality. All foreign tourists in Mexico say that they never tasted good chocolate till they drank it here; an assertion in which we fully agreed. It is usually prepared in families from the cocoa-nut, and one accustomed to the Yankee compound of that name would hardly recognize it as the same article. The same curiosity in regard to our culinary and other operations was manifested here as elsewhere by the crowds around our tents. The use of the tooth-brush was looked upon as something very droll, and the taking of a seidlitz powder, a phenomenon in the way of drinking which they could not comprehend. We were again beset here by would-be purchasers, who could hardly be persuaded that we did not come to trade. Like the people of the other towns we had passed, they were in constant fear of the Apaches, and we were told that no one dared venture into the Alameda after dark.

June 3d Set off this morning on our return, in advance of the wagons, which required some slight repairs. We followed as before the bed of the Sonora river, which, in our day's journey of seventeen miles, we crossed and re-crossed fifty-one times. At 12 o'clock, having struck a pleasant spot where there was fine grass, with other necessaries for an encampment, we stopped, believing that it would be quite as far as the teams could come owing to the difficulties of the road. At 5 o'clock the wagons joined us, the mules showing great fatigue.

June 4th. Resumed our journey this morning

at half-past five, our route being through the great cañon. Having less cutting to do than before, and being acquainted with the road, we accomplished our task in nine hours, and drove on two miles beyond Bacuachi, where we encamped. In passing the town we endeavored to replenish our stock of eggs; but a single dozen was all the place afforded. The wagons stopped in the cañon, to rest and feed the mules; which prevented their reaching camp till 5 o'clock. Distance travelled fifteen miles.

June 5th. Remained in camp till noon, to repair one of Colonel Craig's wagons, which had received some damage in the cañon. We then set off and pushed on rapidly, over a pretty level and easy road for twelve or fifteen miles, which brought us to the foot of the mountains. Before attempting the passage of the defile, which would be more difficult than it was in coming through, it being now chiefly on the ascent, we doubled the teams at once, putting ten mules to each wagon. All went on very well until we came to a steep hill with a sidelong slant. The carriage led the way; but with all the care of my driver, the mules unable to maintain their position slid on their haunches, and on coming to a narrow turn the tongue snapped off, and the carriage was with great difficulty saved from upsetting. The first wagon that followed was one of my own, driven by Jesus. On coming to the same treacherous place, in spite of all our efforts to prevent it, the wagon slid down, bringing the forward wheel suddenly against a rock, and crushing it almost into atoms; the wagon turned bottom upwards, rolling down the ravine, and scattering its contents as

it went. Before the other wagons were suffered to descend, we filled up the lower side of the road as well as we could with stones; then placing a man at the head of each mule, with others to hold back the wagons, let them gradually down in safety.

It was nearly dark, and we were in a narrow gorge of the mountains where there was barely room for the wagons to pass. The whole earth had lately been burned over to the very mountain tops, which were even now throwing up columns of flame and smoke; not a blade of grass was to be seen, no water was near, and there was not a level space sufficient to pitch our tents. To remain here would have been injudicious, and the only alternative was to leave the broken wagon with its contents, which was chiefly corn, and push on to the place where we had encamped on our journey down. By this time Wells, with his usual ingenuity, had managed to splice the tongue of the carriage with his chains and halter ropes. Such articles of value as we did not wish to leave exposed, were placed in the other wagons, and the corn was piled up by the road side. All being ready, Dr. Webb and myself set off on foot, unwilling to burden the carriage in its weak state, as the road continued bad; besides, I felt safer in having my movements under my own control than in threading my way in a wheeled vehicle, through such a defile as we were now passing after dark. The horsemen followed us, and the carriage and wagons came after. In this manner we worked our way slowly along by the dim starlight that glimmered through the forest; for the cañon was thickly overgrown with trees. It was nearly 10 o'clock before

we came upon the opening where we had stopped before, and half an hour more brought us to our old camping ground. Few were disposed, after the fatigues of the day, to wait for supper; for my own part, I had walked not less than twelve miles over rugged mountains, and felt that rest would do me more good than eating. The tents were pitched; and after a refreshing cup of tea, which our cook had hastily prepared, we wrapped ourselves in our blankets, and were soon lost in sleep.

June 6th. We lay by to-day to repair damages. The first thing done was to send a man back some fifteen miles, with a mule for the forewheel of a broken wagon which we had noticed in passing; and to dispatch others to the scene of our disaster in the cañon, to bring the wreck of the wagon and its contents to our camp.

I have before spoken of the picturesque spot where we were now encamped, it being the same in which we passed the night of the 27th May; and as we were obliged to stop for a day, we were most fortunate in having reached so desirable a place. I spent the day in wandering about the hills with my gun and sketch book; others who went in pursuit of game got a deer and a turkey. When fatigued with our rambles, we returned and spent a few hours in gathering wild currants which abounded within twenty feet of our tents. Believing we could not make a better use of our *panoche* (sugar) than in preserving the currants, the cook appropriated a large portion of our stock to this purpose.

In the afternoon Jesus arrived with the wheel,

which, unfortunately, would not fit our axle. Hoping to repair our damage at Fronteras, now twenty miles distant, we put the corn into the other wagons, and trussed the broken one up in a way that would enable us to get there with it.

June 7th. No event of interest occurred to-day: the broken wagon was brought along very well, and we reached Fronteras early in the afternoon.

June 8th. I applied to a blacksmith the first thing this morning to repair our broken wheel; but as it was some Saint's day, nothing could induce him to work, and he even expressed some doubts about undertaking it on the morrow. In the afternoon the fellow came to my tent, and had the impudence to ask for a couple of dollars to spend at a fandango in the evening, in which case I should have his services on the wheel the next day—of course by paying for them. I was so completely in the fellow's power, for the order of the commandante had no effect upon him, that I gave him the two dollars, and took the risk of getting the work done.

The day was one of great jollity among the whole population; and as they had been for a day or two engaged in distilling mezcal, or aguardiente, from the agave, they succeeded in getting gloriously drunk. But there is a wonderful difference between a Mexican and an Irishman in this predicament. The latter when intoxicated, however mild his natural disposition, becomes frantic and is ready for a fight or any kind of violence. The Mexican, on the contrary, though boisterous, is seldom vicious or troublesome. His desire is then for fun and frolic; and nothing can

restrain him from indulging in these as long as he remains under the influence of liquor. Towards night we heard noises approaching, which we finally decided were intended for music. A rabble at length reached our camp, headed by two fellows, sawing lustily upon violins of domestic manufacture. They performed several pieces, among which I noticed "Oh, Susannah," "Dan Tucker," and other popular airs which had probably been introduced by the Sonorians, who had returned from California. Having entertained us sufficiently, one of them stepped forward, and informed us that there was to be a fandango in the evening, and that we were invited to attend. They then gave a few more *morceaux* and left us.

Mezcal, or aguardiente, is a spirituous liquor of great strength, much more so than our strongest whiskey. It is obtained from the bulb or root of the maguay or *agave mexicana*, and is the common alcoholic drink throughout the country. The process of making this liquor is as follows: A hole is first dug some ten or twelve feet in diameter, and about three deep, and is lined with stones. Upon this a fire is built and kept up until the stones are thoroughly heated. A layer of moist grass is then thrown upon the stones, and on this are piled the bulbs of the maguay, which vary in size, from one's head to a half bushel measure, resembling huge onions. These are again covered with a thicker layer of grass; and the whole is allowed to remain until they are thoroughly baked.* They are then removed to large leathern bags, and

* My readers in Rhode Island and Massachusetts will notice a strong

water is poured on them to produce fermentation. At the end of a week the bags are emptied of the maguay and its liquor, which, after undergoing the process of distillation, is ready for use.

But the mezcal is the least important of the uses to which the maguay is applied. When its stem is tapped there flows from it a juice which, on being fermented, produces the *pulque*, a favorite beverage in Central and Lower Mexico, though little known in the Northern States. From the fibres of its massive leaves, which grow to five or six feet in length, and two inches in thickness, is spun a stout thread, which is again doubled, and twisted into ropes. Next, a heavy bagging is made of it, similar to that in which our coffee comes to market. Again, the more delicate leaves are rolled up into balls, and these, on being pounded, form a lather which answers the purpose of soap. It is likewise used to a great extent as a thatch. The younger leaves are eagerly eaten by cattle; and it is said that the minute particles of silica in its stem render it, when cut longitudinally into strips, an excellent substitute for a razor strop. But there is yet another use to which it is applied, viz., as an article of food. For this purpose the bulbs or roots are baked in the ashes, or in the same manner as for making aguardiente, and the outer skin stripped off. It is then sweet, and rather pleasant to the taste, and is extensively used by the Indians on the Gila as well as by

resemblance to their manner of baking clams; the only difference being that for the clams, they use the wet sea-weed, when the Mexicans use the green grass.

the Mexicans on the Rio Grande, who are too lazy to cultivate the soil and raise corn. The engineers attached to the Commission told me that the entire Mexican population at Presidio del Norte, consisting of a thousand souls, had no other food for more than six months.*

June 9th. In camp at Fronteras. The people crowded around us as on the previous visit, some to see the doctor, and others the cook. The doctor found the bread he had cast upon the waters returning; bottles of aguardiente, cakes of sugar, and piles of tortillas, came to him at the hands of the señoras and señoritas in such profusion as to excite the envy of the young gentlemen of the party, many of whom applied for the office of hospital steward with the hope of sharing some of the perquisites. But how shocked were the good people when they saw to what base purposes their precious aguardiente was converted. The doctor, although he received the liquor readily enough, had no idea of applying it to the purposes intended by the donors, but used it for preserving his beloved lizards, frogs, fishes, and other specimens in natural history. As it would have been useless to attempt explaining to his patrons his object in collecting and preserving these ill-favored reptiles, they were permitted to rest in the belief that he was making of them some decoction for medicinal purposes.

June 10th. In Fronteras. A wild bull was sent to us to-day by Captain Gomez, which furnished us

* I afterwards saw the agave used as food by the Apaches, the Pimos, the Coco Maricopas, and the Diegenos, on the shores of the Pacific.

with all the fresh meat we required to carry us home. It is true we had on hand a stock of dried beef; but nothing short of dire necessity could induce us to touch it. The wheel being at length completed, though in a very bungling manner, we made preparations to resume our journey in the morning.

June 11th. Took an early start, and moved rapidly over the first portion of the road, which was quite smooth, and arrived at the mountain called *Cavoyan*, around the eastern end of which we had to pass to reach the valley of the Agua Prieta. On examining the damaged wheel, I found it in a dubious condition, the spokes having all worked loose. We strengthened it as well as possible, by inserting new ashen spokes, and lashing all together with raw hide; and then pushed on, driving over the hills as carefully as possible. We had scarcely proceeded a mile, however, when, on coming to an uneven place, the wheel crushed down, splitting spokes and hub to pieces, and overturning the wagon, which deposited its contents on the ground in all directions. As the little stream which takes its rise at the Agua Prieta was but a few rods from us at the time, we selected a spot in a grove of cotton-woods, and stopped there for the night.

A further examination of the wheel showed that it was impossible to mend it, and that it must be condemned and abandoned. In order to make the most of the wreck, we took off the hind wheels and put them on the forward axle; then, by sawing the box in two, the vehicle was converted into a cart. On this we placed the corn, and distributed the rest of the load among the other wagons.

We passed many wild cattle to-day. In one place a large bull was seen mired by his hind legs, which were sunk deep in the mud, while his free legs were on hard ground. The poor creature had evidently been in this situation several days; and the crows, buzzards, and wolves had already marked him as their prey. As we approached him the wolves scampered off. The buzzards had actually commenced work on his flanks, which they had dreadfully lacerated, so that the blood was trickling down his haunches. To end the misery of the suffering animal, a ball was put through his heart by one of the party. About half the night was spent in getting our new vehicle ready.

June 12th. Got an early start, and retracing our steps up the valley of the Agua Prieta, reached that spring, ten miles distant, at eight o'clock, where we stopped to water. Found a wild bull here, which appeared to have been wounded in his hind quarters. He seemed quite disposed to give us battle; and fearing he might charge upon the train, and stampede the mules, I thought it the wisest course to give him room. Soon after, we struck Cooke's California road, which presented a striking contrast with the rough and trackless region we had been traversing for more than a hundred miles. It was here perfectly smooth; and from our late gait of a slow walk, we were enabled to move off on a trot, thus reaching San Bernardino at two o'clock, four and a half hours from Agua Prieta.

June 13th. Starting fresh, we hastened over the plateau, and soon entered the cañon in the Guadalupe Pass, which had so charmed us by its luxuriant vege-

tation and picturesque beauty. But what a change had taken place! A fire had passed over it, destroying all the grass and shrubbery, and turning the green leaves of the sycamores into brown and yellow. The surface of the earth was covered with black ashes, and we scarcely recognized it as the enchanting place of our former visit. At first we feared that this devastation had been caused by our own neglect; but on reaching the spot where we had encamped, which was separated from the surrounding hills by the rocky bed of the stream, we found the dry grass still around the place, which alone had escaped the fire. A little further on we came to a camp of two hundred Mexican soldiers, a portion of the brigade of General Carrasco. They told me that General Carrasco had been to Janos; and hearing that a party of Americans bound for California had been attacked on the road leading from Janos to Guadalupe Pass, he divided his force with the view of intercepting the marauders. He himself had taken the Babispe route, to the south of us. The party we met had with them a large number of pack mules, transporting arms and ammunition from Janos to Fronteras and Arispe, having been sent to the former place by wagons from the city of Mexico.

The particulars of the attack, as related to me by these men, were, that a party of ten Americans, with two wagons, was fired upon by a band of Apaches lying in ambush; that one was killed and three wounded, when the remainder cut loose the mules (each mounting one), abandoned their wagons, and escaped to Janos. They said the wagons were still

there, as well as some of their contents. They showed us some salt pork which they had taken themselves—an article which forms no part of a soldier's rations in Mexico.*

We gave the Mexican officers a quarter of our fresh beef. It was evident now how the fire which I have mentioned originated. A portion of the brigade had passed the cañon a few days after us; and their twenty or thirty camp fires had, no doubt, communicated the flames to the grass, which had afterwards extended over the whole mountain.

At two o'clock we reached the worst portion of the Guadalupe Pass, where the great and sudden rise takes place. We attempted to double the teams, but found that no more than four mules could be used to advantage, owing to the short turns in the road. The getting up these hills proved a very difficult task, and it was only by every one putting a shoulder to the wheels and chocking them at every five or six feet, that they could be surmounted. It was dark when we reached the small stream seven miles beyond, which, though full when we passed, now furnished scarcely water sufficient for our mules.

June 14th. The road being good, we completed our day's journey by 2 o'clock, P. M., and encamped on the banks of the arroyo where we had nooned before.

* This statement was found to be true on our return to the Copper Mines, where news had been sent from Janos; and on leaving for California, two months later, I took with me a man who had been in the affray, and substantiated what had been related to us by the Mexican soldiers. On returning from California a year later we saw on the spot where this affair took place the skeleton of a man.

The stream was now dry, but water was found in the spring near at hand.

June 15th. In crossing the ridge of hills which separated us from *Las Playas*, the cart took a side lurch and broke down, every spoke giving way and the wheel crushing to pieces. As the accident was past remedy, the contents of the cart were distributed among the wagons, and we hastened on, reaching *Las Playas* at noon. Here the grass and water was so good that we remained until 4 o'clock, when we pushed on in order to accomplish that night as much as possible of the long distance of fifty-two miles that lay before us without water. Kept on till 10 o'clock, P. M., when we encamped on the arid plain.

June 16th. The road being excellent, an early start and fast driving brought us to *Ojo de Vaca*, by 2 o'clock, P. M. There was scarcely grass enough here to give our animals a feed, which was accounted for by one of our trains having stopped here on its way from the Copper Mines to *Janos*.

June 17th. Left at 3 A. M. and rode to *Pachetehú*, nineteen miles, where we gave the animals a little rest, and took breakfast. Resuming our journey, we pushed forward and reached the Copper Mines before noon, finding our party much alarmed at our long absence.

A mail had arrived in the mean time, bringing a large budget of letters and newspapers; but to my great disappointment, nothing was heard of Colonel Graham. The engineers, with their assistants, were still waiting, and could not enter the field until he arrived.

June 20th. Deeming it necessary that some steps

should be taken in consequence of the continued absence of Colonel Graham, without whom, or his assistants, I could not send another astronomical party into the field, I determined to visit the camp of Lieutenant Whipple, who I had been informed had reached the Mimbres with his advanced parties, to consult with him as to future operations. I accordingly left this morning, accompanied by Lieutenant Green, and Messrs. Cremony, White, and Jones. Reaching the Mimbres, we followed it down about twenty-eight miles below the Copper Mines, when at evening we arrived at the camp of General Condé and the Mexican Commission. There I learned that Lieutenant Whipple was encamped on the plain near Cooke's Spring, eighteen miles distant; so I concluded to go no further, but send for him to join us at General Condé's camp.

June 21st. Lieutenant Green and Mr. Cremony set off this morning after Lieutenant Whipple. I remained in camp under a bower of bushes, keeping as quiet as possible during the day, as the heat was too intense to admit of stirring about. The general and his party had found these bowers so much more comfortable than their tents, that they had constructed several, in which they remained during the day, resorting to their tents only at night, or at meal times. The river near where the party was encamped was entirely dry, and water could be procured only by digging in its bed. A little pool remained, where the animals were watered. In the evening Lieutenant Whipple, accompanied by Mr. Salazar, the Mexican chief astronomer and surveyor, Lieut. Green, and Mr. Cremony, arrived.

June 22d. We held a consultation to-day relative

to the parties for the survey of the Gila, which General Condé was most anxious to commence at once. Our surveying parties had long been organized, and were ready; but we had no astronomical corps to send with them, without which, it would not be proper to undertake so important a work. Lieutenant Whipple was making rapid progress with his survey of the line west from the Rio Grande; and he believed it best, as we had now waited so long, to defer further action until Colonel Graham should arrive.

June 23d. To avoid the heat of the day, we set out on our return at 2 o'clock, A. M., and reached the Copper Mines at nine.

CHAPTER XIII.

INCIDENTS AT THE COPPER MINES.

Visit from the Apaches—Mangus Colorado—Arrival of Mr. Sanford—11th Article of the treaty relating to captives—Arrest of New Mexican traders—Inez Gonzales the Mexican captive—Examination of traders—Story of the captive girl—Pinaleños Indians—General Condé arrives—The 11th Article of the treaty enforced—Friendly intercourse with the Indians—Two Mexican boys taken from them—Excitement in consequence—Conference and dialogue with the Apache chiefs—Amicable settlement of difficulties.

ON the day of my return from Sonora, the first Apache Indians we had seen paid us a visit, headed by their head chief, Mangus Colorado, or Red Sleeve. He was accompanied by twelve or fifteen of his tribe, and said he had followed us for several days; that his people had seen us when we went down to Sonora, and were several times near our encampments on the journey. He said they knew my carriage, and that we belonged here. He thought we ran a great risk in going so far with so small a party; as there were many bad Indians prone to theft and murder in the country through which he passed, and whom he could not control. He said he was a friend of the Americans, and that his people desired to be at peace with us. He remembered General Kearney and Colonel Cooke, when

they passed through this country a few years before. I explained to him the war between the United States and Mexico, and its results, all of which he pretty well understood already. I told him that we had now come out to see this country, and mark the line that separated the territory of Mexico from that acquired by the United States; that all the Indians who lived on our side of the border, would have our protection as long as they conducted themselves properly and committed no thefts or murders; but that if they stole any mules or cattle belonging to the Americans, we should pursue and punish them; and by our treaty with Mexico, we were bound to extend to her people the same protection. Our protection of the Mexicans he did not seem to relish; and could not comprehend why we should aid them in any way after we had conquered them, or what business it was to the Americans if the Apaches chose to steal their mules, as they had always done, or to make wives of their Mexican women, or prisoners of their children. I told them the Americans were bound to do so and could not break their word; and if they (the Apaches) committed any farther depredations on Mexico, we should not shield them from the consequences. Mangus Colorado denied that he had ever injured the Americans; and when I told him I had learned that some of his people had lately attacked a party of our countrymen on their way to California, and killed one man, he pretended to know nothing about it. On a subsequent interview I brought this affair again to his notice, when it appeared that he was acquainted with it, but said it was done by some bad people living in a certain mountain range, over whom

he had no authority. He promised that his people should not trouble us or the Mexican Commission, and that he would send back any mules or cattle that might be taken by his young men; and furthermore, if any strayed away, he would have them caught and sent back to us. I then informed him and the other chiefs, that to show our good feelings towards them, I would make them some presents, and accordingly directed the Commissary to distribute among them some shirts, cotton cloth, beads, and other articles, which pleased them much. They asked for whiskey, which I positively refused, denying that I had any. Although this was the simple truth, they did not believe it, not being able to imagine how a party of Americans could be without that indispensable article.* They were constantly on the look-out for it, and when they saw a bottle they asked if it did not contain the coveted liquor. I one day handed them a bottle of catsup and another of vinegar, and told them to ascertain for themselves. A taste put a stop to their investigations, and they were afterwards less inquisitive. On one occasion a party of Indians were found to be drunk shortly after coming in, which induced me to believe they had obtained liquor somewhere about our camp; but of whom, or where, I could not ascertain, as all denied having given it to them. I communicated the fact to Colonel Craig, who was equally determined with myself to put a stop to the practice. He believed he

* In all my intercourse with the Indians, during the two and a half years I was in their country, I never gave one of them a drop of ardent spirits. I also prohibited others from doing so; but on a few occasions, had reason to suspect that my orders were disobeyed.

could trace it to the sutler's shop; and finding a barrel of whiskey there, he took possession of it and had it transferred to the Commissary's depot.

On the 24th June, Mr. S. P. Sanford, bearer of dispatches, arrived from Washington, and brought me the pleasing news that Colonel Graham, for whom we had so long been waiting, had probably reached El Paso on that day, accompanied by several officers.* Great joy was felt by all at this prospective termination to our inactive state. Many of the engineers and assistants had now been attached to the Commission ready for duty seven months, without having yet taken the field.

On the 27th June an incident occurred, which will long be remembered by every one connected with the Boundary Commission. It was such as to awaken the finest sympathies of our nature; and by its happy result afforded a full recompense for the trials and hardships attending our sojourn in this inhospitable wilderness.

On the evening of the day alluded to, a party of New Mexicans came in for the purpose of procuring provisions, &c., having with them a young female and a number of horses and mules. By what dropped from them in the course of conversation, it was ascertained that the female and animals had been obtained from the Indians; and that they were taking the girl to some part of New Mexico, to sell or make such disposition of her as would realize the most money. As

* On the 30th June I received a note from Colonel Graham, announcing his arrival at El Paso on the 24th.

all traffic of this kind, whether in mules or captives, was strictly prohibited by the treaty with Mexico, I deemed it my duty, as the nearest and highest representative of the government of the United States in this region, to interfere in the matter. My authority for so doing is contained in the second and third sections of the eleventh article of the treaty of Guadalupe Hidalgo referred to, where it is declared that—

“It shall not be lawful, under any pretext whatever, for any inhabitant of the United States to purchase or acquire any Mexican, or any foreigner residing in Mexico, who may have been captured by Indians inhabiting the territory of either of the two Republics, nor to purchase or acquire horses, mules, cattle, or property of any kind, stolen within Mexican territory by such Indians.

“And in the event of any person or persons, captured within Mexican territory by Indians, being carried into the territory of the United States, the government of the latter engages and binds itself, in the most solemn manner, so soon as it shall know of such captives being within its territory, and shall be able to do so through the faithful exercise of its influence and power, to rescue them and return them to their country, or deliver them to the agent or representative of the Mexican government. The Mexican authorities will, as far as practicable, give to the government of the United States notice of such captures; and its agent shall pay the expenses incurred in the maintenance and transmission of the rescued captives, who, in the mean time, shall be treated with the utmost hospitality by the American authorities at the place where they may be.

But if the government of the United States, before receiving such notice from Mexico, should obtain intelligence through any other channel of the existence of Mexican captives within its territory, it will proceed forthwith to effect their release and delivery to the Mexican agents, as above stipulated."

With this authority before me I addressed a note to Lieut. Colonel Craig, commander of the escort, requesting him to demand the surrender of the female, and to prohibit the men, who intended departing at early dawn, from leaving their encampment until further orders. This request, which was made late in the evening, was promptly complied with under the immediate directions of Lieutenant D. C. Green.

The ensuing day the three principal traders of the party were brought up to the fort, and separately examined, in reference to the manner in which they had obtained, and the right they had to the possession of, the captive girl and the animals. These three persons were Peter Blacklaws, a trader in Santa Fé, Pedro Archeveque, a laborer of Algodones, and José Faustin Valdez, a laborer of Santa Fé.

Their evidence was somewhat conflicting—more particularly with respect to the female. It appeared there was a party of about fifty men who had been trading with the Indians north of the Gila; a portion of them still remained there, whilst another portion (about twenty) were here, on their way back to Santa Fé. The whole had been trading under *one and the same license*, although it was acknowledged that the name of none of them, save Peter Blacklaws, was inserted in it; he, however, declared that he was

authorized—which is hardly probable—to add to his party as many as he chose. This license was called for, but not produced, it being, as was stated, in the possession of the other portion of the party. They seemed to consider themselves fully authorized, by virtue of the license, to purchase any species of property held by the Indians, and this without any regard to the manner in which the latter obtained it. They seemed surprised that I should question their rights on the strength of a treaty, the stipulations of which they knew nothing about.

As respects the captive girl, who it was acknowledged was bought of the Piñal Indians, even placing their conduct in the most favorable light, it is quite apparent that she was purchased, like any other article of merchandise, as a matter of speculation. According to part of the testimony, the expedition was fitted out for the express purpose of buying her; while others declared that the purchase was an incidental matter. It appeared that her apprehensions at being taken by these men still further from her home, instead of being restored to her natural protectors, had been quieted by assurances that her purchaser was acquainted with relatives of hers in Santa Fé; although his testimony showed, as might have been anticipated, that he had no such acquaintances at all.

The girl herself was quite young, artless, and interesting in appearance, prepossessing in manners, and by her deportment gave evidence that she had been carefully brought up. The purchaser belonged to a people with whom the system of peonage prevails, and among whom, as a general thing, females are not

estimated as with us, especially in a moral point of view. The fate that threatened her under these circumstances, being too apparent, I felt under no necessity of regarding the protestations of Blacklaws, as to the honesty of his intentions, inasmuch as the treaty prohibits purchases of this kind "*under any pretext whatever.*" I therefore deemed it to be my duty—and a pleasant one it certainly was, to extend over her the protection of the laws of the United States, and to see that, until delivered in safety to her parents, she should be "treated with the utmost hospitality" that our position would allow.

The substance of the following brief statement was furnished by this young captive :

Her name is Inez Gonzales, daughter of Jesus Gonzales, of Santa Cruz, a small frontier town, near the River San Pedro, in the State of Sonora. She was then in the fifteenth year of her age. In the September preceding she had left her home, in company with her uncle, her aunt, another female, and a boy, on a visit to the fair of San Francisco, in the town of Madelena, about 75 miles distant. They were escorted by a guard of ten soldiers, under the command of an ensign named Limon. When one day's journey out, viz., on the 30th of September, 1850, they were attacked by a band of Piñol Indians, who lay in ambush in a narrow wooded cañon or pass. Her uncle was killed, and all the guard, save three persons, who made their escape. She with her two female companions, and the boy, Francisco Pascheco, were carried away into captivity. She has been with the Indians ever since. The other captives she understands were

purchased and taken to the north by a party of New Mexicans who made the Indians a visit last winter. No improper freedom was taken with her person; but she was robbed of her clothing, save a skirt and under linen, and was made to work very hard. She spent the whole period of her captivity at two of the regular rallying spots or planting grounds of the Piñols.

This tribe is also known as the Piñal, or Pinaleños. embraces about five hundred souls, and ranges over an extensive circuit between the Sierra Piñal and the Sierra Blanca, both of which mountains are near the Upper San Francisco River, about five days' journey north of the Gila.* Within this space the young girl knew of at least twelve female captives, besides numerous males. Generally, the Indians are very willing to sell, that being their object in making the captures. The men spend their time in hunting and depredating; and the women are required to do all the work in their wigwams and generally in the field. All females in this respect being treated alike, their own faring no better than captives. Their food consists almost exclusively of the root of the maguay, baked as I have before described.

I never saw any of the Piñal Indians, though a band was met by one of the surveying parties on the Gila. They were described to me as a fine looking people. At first they were shy; but when they discovered that our party were Americans, and were well

* There are two streams by this name on Emory's map, which empty into the Gila; I refer to the eastern one. The western one is known on the Spanish maps as the Rio Verde, or Ascencion.

disposed towards them, they became quite friendly. On inquiring of the Apache Chiefs concerning them, I learned that they belong to the same great tribe, but seldom have any intercourse with the Apaches proper, being separated from them by broad deserts and lofty mountains.

General Garcia Condé, the Mexican Commissioner, being encamped about twenty-six miles off, I dispatched a messenger to him requesting his presence, to advise and co-operate with me in this matter. He accordingly visited me, and, upon inquiring, found that he was acquainted with the released captive's father, a respectable citizen of Santa Cruz. He approved warmly of my course, evincing, as it would, to his government a determination on the part of the United States to solemnly and faithfully fulfil its treaty stipulations. He also particularly solicited that the young woman should be kept under my protection until such time as she could be restored in safety to her home.

The fair captive was of course taken care of by the Commission. She was well clad with such materials as the sutler of the escort and the commissary of the Commission could furnish; and besides the more substantial articles of clothing provided for her, she received many presents from the gentlemen of the Commission, all of whom manifested a deep interest in her welfare, and seemed desirous to make her comfortable and happy. But with all the attentions extended to her, her situation was far from enviable in a camp of over a hundred men, without a single female with whom she could hold any intercourse. She found

employment enough in making her own garments, being quite expert at her needle, and occasionally spent an hour in reading the few Spanish books in our possession.

Another incident upon which the 11th article of the Treaty of Guadalupe Hidalgo has a direct bearing, occurred on the day succeeding that of the event just related.

Ever since my return from Sonora, the Apaches, with their chiefs, women, and children, had been daily visitors to the Copper Mines, and to our several encampments. The most friendly feelings had been manifested by them; and in return, we had not failed to let them know that it was for their interest to be at peace with us, and, as far as lay in their power, to restore to us any mules or cattle that strayed away. An additional evidence that there was a sincerity at the time in our Apache friends was the freedom with which their women and children visited our camps and quarters. They had themselves encamped about four miles from us, and had with them large herds of horses and mules.

On the day referred to, when a large party of the Apaches were in, two Mexican boys suddenly rushed into the tent of Mr. Cremony, which was pitched in the outskirts of the place, and sought his protection from their Indian captors. He at once brought them to my quarters; and, on being questioned, they stated that they had been stolen from their homes by the Apaches. One, named Saverro Aredia, and about thirteen years old, had been taken from the town of Bacuachi, in the State of Sonora, six months before; the other,

José Trinfan, ten or twelve years of age, belonged to Fronteras, in the same State, and had been held a prisoner six years. Believing, from what they had heard the Indians say, who had visited the Copper Mines, that they would find protection with us, they sought our camp. They were both intelligent looking boys; their hair was cropped short, and they were entirely naked.

When these youths were brought to me, Mangus Colorado and Delgadito, two prominent chiefs of the Apaches, and a number of their tribe, were present; they already knew of the escape of the prisoners, and at once proposed that I should purchase them. I declined, telling them that the Americans did not buy captives; and furthermore, that having sought my protection, I should not deliver them up. In vain I endeavored to make the chiefs comprehend our treaty with Mexico, and the principles of justice and humanity on which it was based. They did not, or would not, understand, and left our camp evidently much offended. I requested Mangus Colorado to come to me on the following day, when I would endeavor to satisfy him. The day arrived, but Mangus did not appear; and I began to be fearful that the friendly feeling which existed between the Commission and the Indians would be terminated by this event. I received intimations that the boys were not safe, and that an attempt would probably be made to recapture them the first opportunity. Determined not to be thwarted in this way, I sent them off at night, well clothed, in charge of four resolute men, with directions to take them to the camp of General Condé and deliver them into his hands.

After the lapse of several days, the chiefs with their people, including the owner of one of the boys, again made their appearance. The matter was again talked over, but nothing was decided, and they returned to their camps. After several fruitless conferences of this sort, the affair was at length so arranged that the captives should be retained by us, and our friendly relations not be impaired. As this last discussion was one of much interest, it was taken down by one of the gentlemen present. I give it therefore at length, as the arguments used by my opponents display to good advantage their natural shrewdness of character. It was commenced by Mangus Colorado, who thus addressed me :

Mangus Colorado.—Why did you take our captives from us ?

Commissioner.—Your captives came to us and demanded our protection.

Mangus Colorado.—You came to our country. You were well received by us. Your lives, your property, your animals, were safe. You passed by ones, by twos, and by threes, through our country ; you went and came in peace. Your strayed animals were always brought home to you again. Our wives, our children, and women, came here and visited your houses. We were friends ! We were brothers ! Believing this, we came amongst you and brought our captives, relying on it that we were brothers, and that you would feel as we feel. We concealed nothing. We came not here secretly or in the night. We came in open day and before your faces, and we showed our captives to you. We believed your assurances of

friendship, and we trusted them. Why did you take our captives from us?

Commissioner.—What we have said to you is true and reliable. We do not tell lies. The greatness and dignity of our nation forbids our doing so mean a thing. What our great brother has said is true, and good also. I will now tell him why we took his captives from him. Four years ago, we, too, were at war with Mexico. We know that the Apaches make a distinction between Chihuahua and Sonora. They are at peace with Chihuahua, but always fighting against Sonora. We in our war did not make that distinction. The Mexicans, whether living in one or the other State, are all one nation, and we fought them as a nation. Well, when the war was over, in which we conquered, we made peace with them. They are now our friends, and by the terms of the peace we are bound to protect them. We told you this when we came to this place, and we requested you to cease your hostilities against Mexico. Well, time passed, and we grew very friendly; every thing went well. You came in here with your captives. Who were these captives? Mexicans—the very people we told you we were bound to protect. We took them from you and sent them to General Garcia Condé, who will set them at liberty in their own country. We mean to show you that we cannot lie. We promised protection to the Mexicans, and we gave it to them. We promise friendship and protection to you, and we will give it to you. If we had not done so to Mexico, you could not have believed us with regard to yourselves. We cannot lie.

Ponce.—Yes, but you took our captives from us without beforehand cautioning us. We were ignorant of this promise to restore captives. They were made prisoners in lawful warfare. They belong to us. They are our property. Our people have also been made captives by the Mexicans. If we had known of this thing, we should not have come here. We should not have placed that confidence in you.

Commissioner.—Our brother speaks angrily, and without due reflection. Boys and women lose their temper, but men reflect and argue; and he who has reason and justice on his side, wins. I have no doubt but that you have suffered much by the Mexicans. This is a question in which it is impossible for us to tell who is right, or who is wrong. You and the Mexicans accuse each other of being the aggressors. Our duty is to fulfil our promise to both. This opportunity enables us to show to Mexico that we mean what we say; and when the time comes, we will be ready and prompt to prove the good faith of our promises to you.

Ponce.—I am neither a boy nor a squaw. I am a man and a brave. I speak with reflection. I know what I say. I speak of the wrongs we have suffered and those you now do us. (Very much excited.) You must not speak any more. Let some one else speak (addressing himself to Mr. Cremony, the interpreter).

Commissioner.—I want you to understand that *I* am the very one to speak; the only one here who can speak (peremptorily). Now do *you* sit down. I will hold no more talk with you, but will select a *man*

(beckoning to Dalgadito). Do you come here and speak for your nation.

Dalgadito.—Let my brother declare the mind of his people.

Commissioner.—I wish to explain to our Apache brethren the reasons that have actuated us in this thing, and what we can do for the master of these captives. We know that you have not done this thing secretly, or in the dark. You came as braves in open day, and brought your captives amongst us. We are obliged to obey the orders of our great chief in Washington as much as you warriors are obliged to obey your commanders. The great chief of our nation says: "You must take all Mexican captives that you meet among the Apaches, and set them at liberty." Now this you must know we cannot disobey. For this reason we have taken your captives from you.

Dalgadito.—We do not doubt the word of our brave white brethren. The Americans are braves, *we know it*; and we believe a brave scorns to lie. But the owner of these captives is a poor man; he cannot lose his captives, who were obtained at the risk of his life, and purchased by the blood of his relatives. He justly demands his captives. We are his friends, and we wish to see this demand complied with. It is just, and as justice we demand it.

Commissioner.—I will now tell my Apache brethren what can be done for them. The captives cannot be restored. The Commissioner cannot buy them, neither can any American buy them; but there is here in our employ a Mexican who is anxious to buy them, and restore them to their homes. We have no objection

that this Mexican should do so; and if he is not rich enough, some of us will lend him the means.

Dalgadito.—The owner does not wish to sell; he wants his captives.

Commissioner.—I have already told my brother that this cannot be. I speak not with two tongues. Make up your minds.

Dalgadito.—The owner wants twenty horses for them.

Commissioner.—The Apache laughs at his white brother! He thinks him a squaw, and that he can play with him as with an arrow! Let the Apache say again.

Dalgadito.—The brave who owns these captives does not wish to sell. He has had one of those (two) boys six years. He grew up under him. His heart-strings are bound around him. He is as a son to his old age. He speaks our language, and he cannot sell him. Money cannot buy affection. His heart cannot be sold. He taught him to string and shoot the bow, and to wield the lance. He loves the boy, and cannot sell him.

Commissioner.—We are sorry that this thing should be. We feel for our Apache brother, and would like to lighten his heart. But it is not our fault. Our brother has fixed his affections on the child of his enemy. It is very noble. But our duty is stern. We cannot avoid it. It wounds our hearts to hurt our friends; but if it were our own children, and the duty and the law said, "Part with them," part with them we should. Let our Apache brother reflect, and name his price.

Dalgadoto.—What will you give ?

Commissioner.—If my brethren will come with me I will show them.

Here the council dissolved and repaired to the commissary's stores, attended by the Mexican purchaser, where goods to the amount of two hundred and fifty dollars were laid out, which they accepted, and thus the business was concluded.*

Under no other circumstances would I have been instrumental in remunerating these Indians for their captives: but in the present state of the Boundary Survey, this affair, had it not been amicably adjusted, might have proved a most serious obstacle to the prosecution of our duties.

The Indians remained encamped on both sides of us in large force. Mangus Colorado with his band, being on the west about four miles off, and Dalgadito at the distance of eight miles near the Mimbres, where, on account of the superior grass in the valley of that stream, the greater portion of our horses and mules were kept. It was therefore completely in the power of the Indians to drive them all off, if they were so disposed. In promising them our friendship, I told them that they must deserve it by protecting our animals; and if unfriendly Indians should attempt to steal them, they must restore them to us. This they promised to do, and they faithfully adhered to their undertaking. Once, some of our animals were stolen,

* These boys were not detained a moment at the camp of the Mexican Commissioner, but sent to Janos, the nearest military post in Mexico, from whence they were taken to their families.

and on several occasions they strayed away ; but in every instance the Indians brought them back, and sometimes at the expense of much labor and trouble to themselves.

CHAPTER XIV.

INCIDENTS AT THE COPPER MINES.

Intercourse with the Apaches—Mangus Colorado and his new clothes—Proper mode of treating Indians—Treachery and Massacre of Indians, by an Englishman—Tribe of Copper Mine Apaches—Their numbers—Extent of their incursions—Ethnological Position—Inferiority of the Tribe—Dress—Visit from the Navajos—Their Fine Blankets—An Apache shot by a Mexican—Alarm—Arrest and Examination of Prisoner—Death of the Indian—The Murderer demanded by the Apaches—Conference with the Chiefs, and their Talk—Restoration of Friendship.

AFTER the pleasant termination of our difficulty with the Apaches relative to the captive boys, they continued their daily visits as before, and were subject to no restraint. They always made their first calls on Colonel Craig, who treated them with the greatest kindness, or myself; after which they strolled about visiting the quarters or tents of the others, or watching the several mechanics in their labors. I had a full suit of blue broadcloth, made for Mangus Colorado, and gave all his family clothing besides. Some of his children, of which, I think he had nine, generally accompanied him, and always received some little knick-knacks to take back with them. Mangus was mightily pleased with his suit, which consisted of

a frock coat lined with scarlet and ornamented with gilt buttons. His pantaloons, at his request, were open from the knee downwards, after the fashion of the Mexicans, with a row of small fancy buttons on one side, and a broad strip of scarlet cloth on the outer side from the hip downwards. A white shirt and red silk sash completed his dress. While the tailor had it in hand, he visited him daily to watch its progress, and a child might have envied him his delight. But in putting them on, his Indian character was most strikingly displayed. He insisted on wearing his shirt outside of his pantaloons; and all my efforts to induce him to reverse the arrangement were without effect. The reluctance of all Indians to conform to our customs with regard to dress is well known; and it is only after many years of constant intercourse that the men will wear their shirts as we do. The women adhere with equal tenacity to some of their customs. They prefer the leggin and blanket to any other dress; and even after they have become completely domiciliated among us, as is the case with the Iroquois tribes in the State of New-York, they refuse to give up their broad-brimmed hats and feathers.

I often invited the chiefs, and in particular Mangus Colorado, to dine with me. On these occasions their conduct was marked with as much decorum as though they had been used to civilized society all their lives; though it is true, they sometimes exhibited a curiosity to understand the nature of the dishes that were placed before them, and generally wished to have a taste of every thing. After a little while they showed a dis-

position to take more liberties; and when my guest had finished his meal, he managed to leave his plate pretty well filled, and beckoned to another to take his seat. This was submitted to once or twice; after which, finding it encroached too much on my supply, I no longer invited any to my table. I was willing to give a place to a chief occasionally; but to have half a dozen hungry fellows standing outside waiting to take their turn, was more than I was able or willing to put up with. They knew that we had killed several bears, and that we ate their flesh. They always asked if we had bear on the table, for they wished to avoid it, but, with our cooking, could not tell it from beef. I never deceived them, nor urged them to eat bear's meat. I found they had some superstitious prejudice against it, but could never prevail on them to tell me what it was.

During this time the members of the Commission went about freely in small parties or alone, for twenty or thirty miles around our camp, and were on no occasion molested. They also visited the Apache camps, where they were well received. Our wagons with stores, went unprotected to and from the Surveyors, and their attendants, who were scattered in small parties for fifty miles along the line, where the escort could afford them but little protection. Hence the great importance to the success of the Commission in maintaining friendly relations with these Indians.

My experience established the truth of the opinion I had always entertained, that kind treatment, a rigid adherence to what is right, and a prompt and invariable fulfilment of all promises, would secure the friend-

ship of the Apaches, a tribe of Indians which has the reputation of being the most hostile and treacherous to the whites of any between the Rio Grande and the Pacific. It is the conduct of unprincipled traders and emigrants, who sow the seeds of intemperance and vice among them, which has created most of the difficulties before experienced. These men defraud them of their property, and, on the slightest pretence, take their lives. That the Indians feel the deepest hatred towards the Mexicans is true, and they certainly have reason for entertaining a strong antipathy to that people. Acts of treachery of the grossest and cruelest description have been practised by the Mexicans towards them; and, though years have passed away since these events occurred, they are not forgotten by the Apaches. The desire of revenge, or as we should term it in our own case, of retributive justice, seems, instead of diminishing, to acquire increased intensity, with the lapse of time. But bad as the conduct of the Mexicans may have been towards these Indians, they never were guilty of a more fiendish act than one perpetrated on them by an Englishman, some twelve or fourteen years ago, in the northern part of Sonora. The particulars as related to me are briefly these: and having heard them both at El Paso, and at Arispe, I have no doubt of their correctness. It seems that in consequence of the depredations of the Indians, the State of Sonora offered a premium of one hundred dollars for each Apache scalp. A disgrace to his nation, named Johnson, actuated by the reward, induced a large party of Apaches, men, women and children, to assemble around a quantity of goods, which he had

brought among them ostensibly for the purpose of trade. He had concealed beneath some saddles and flour bags, a cannon heavily loaded with shot and a piece of chain, near which was stationed a man, pretending to smoke. At a signal given by Johnson, this man suddenly uncovered the breech of the gun and touched it off, the rest of his party at the same time discharging their small-arms among the terrified Indians, who fell on every side. When the survivors had collected their senses, and saw the Americans preparing for another volley, they rallied, and being the larger party, put Johnson and his crew to flight. A skirmish afterwards took place, in which the Indians met with further loss. After so base and villainous an act, it is not surprising that the Apaches look upon all white men as their enemies, whether Mexicans or Americans.

The Copper Mine Apaches occupy the country on both sides of the Rio Grande, and extend west to the country of the *Coyoteros* and *Pinalenos*, near the eastern San Francisco River. This may be called their proper home, though their incursions extend far into the States of Chihuahua and Sonora, where, during portions of the year, they reside. A favorite place of resort for them is near Lake Guzman, to the west of El Paso. They do not extend more than four or five days' journey north of the Gila. From the best information I can gain, their numbers have been greatly reduced within the last five years. Omitting those east of the Rio Grande, it is believed that they cannot muster two hundred warriors. My information is derived from General Condé, and from Mexicans who had long

lived on the frontier, having frequent intercourse with them at Janos, and who knew all their chiefs. American authority places their numbers much higher, estimating them by thousands, instead of hundreds. But notwithstanding their depredations, they have from time to time been at peace with the Mexicans, receiving from the military authorities at Janos monthly supplies of corn and other articles of food. Hence the latter have had a better opportunity to judge of their numbers than we have.

Between the Sacramento Mountains and the Pecos are other Apache tribes more numerous than those in question, from whom they are separated by an uninhabited desert region between eighty and one hundred miles in width, extending from the Sacramento Mountains to the Rio Grande. The country which they occupy is believed to be one of the richest portions of New Mexico. It has not yet been explored; but I have been told by Mexicans who have crossed it at various places, that it has an excellent soil, is well watered and timbered. They keep up a show of friendship with the settlements by sending their old women to trade and beg; but the warriors rarely show themselves. It is not my intention to dwell largely on the Indian tribes in the present work, but merely to speak of them as we met them, to point out their localities, and to relate such occurrences as took place between us. There is much to be said relative to them all, which the limits of this work will not admit of, nor does it seem proper in a "personal narrative" of incidents, to enter into the broad field of ethnological investigation which presents itself west of the

Rocky Mountains. My materials in this department are copious, and will constitute the subject of a future memoir.

The Apache nation as a whole is one of the most widely disseminated on the North American Continent, and embraces a great many tribes which are as yet only known to us by name. Nor are we even able to say with certainty whether all the tribes said to be of the Apache stock belong to it or not. It is only by a comparison of their languages that their ethnological position can be accurately determined, In general terms, they may be said to extend from the Pecos on the east to the desert bordering on the Gulf of California (the limit of which is the valley of the Santa Cruz, south of the Gila), and to the Colorado, north of that river; or from the 103d degree of longitude west from Greenwich to the 114th. From north to south they extend from the country of the Utahs (Yutas), in latitude 38° north to about the 30th parallel. Beyond this they have no fixed habitations, though they range about two degrees further south in their predatory incursions in the States of Chihuahua and Sonora. On the Colorado River of California are many tribes only known by name; but whether they are allied to the Apache nation or to some of the California families is not known. The great *Navajo* (pronounced Navaho) tribe, the most populous of any west of the Rocky Mountains, in the district named, belongs to the Apache family; and I have no doubt that when an examination is made of the languages and other means of comparison, tribes still further to the north will be found to belong to the same stock. In fact, from

analogies already selected, such has been found to be the case.*

The Apaches with which we had intercourse must rank below the Indian tribes east of the Rocky Mountains, dwelling on the tributaries of the Mississippi and Missouri Rivers. They are without that dignified

Group of Apaches.

bearing, and those noble traits of character, which characterize the latter; and as they perform no labor,

* In an essay read before the American Ethnological Society by my friend, Professor Wm. W. Turner, he has shown that a close analogy exists between the languages of the Apaches and the Athapascans, a tribe on the confines of the Polar Sea.

not even that of hunting, their physical developments are greatly inferior. Mangus Colorado, and a few other prominent chiefs, who live pretty well, and have the lion's share of their plunder, are rather good looking; and a finer set of children than those of Mangus, of Dalgadito, and Poncé, are not often seen. But beyond these few exceptions, the Apaches are an ill-formed, emaciated, and miserable looking race. As those we saw did not cultivate the earth, they depend upon what they can steal from the Mexicans and Americans on the frontier for a subsistence. The supply thus obtained consists almost exclusively of mules; and when this fails they resort to the bulb of the maguay. In fact, this may be said to constitute at all times the food of the majority; for the chiefs take good care that *they* at least shall have mule meat when there is any.

In saying that certain individuals were fine looking, I speak of mere physical development. I do not think I ever saw a mild or amiable face among them; on the contrary, they had all a treacherous, fiendish look, which well expressed their true character. They are in general poorly clothed, a majority wearing deer skins tied about them, without any attempt to fashion them into garments. If a man could get a shirt, he seemed quite content without any other garment. Many, and I should think most of them, wore long deer-skin boots, with stout soles, turned up at the toes, the legs being either fastened around the loins or turned over at the knees. These were well made, and exhibited more taste and care than any other garment about them. It is not, however, on account of their beauty

that they wear these fine long boots, but from necessity ; as they require them to protect their legs when riding among the thorny chapparal of the plains, as well as from the venomous reptiles which abound there. The Apaches have their dandies as well as their civilized brethren ; in fact I have found among every tribe of Indians men of this class, whose minds seem to dwell more on their personal appearance than on any thing else. They are fond of remaining at home, associate more than others with the women, and never accompany war parties. They are looked upon as drones by the braves. Those whom we saw among the Apaches, were generally dressed in some tawdry manner, and their faces covered with paint. Some, with a truer sense of savage beauty, and who have fine manly forms, wore nothing but a breech cloth and boots. These, mounted on fine animals, and armed with a lance or bow, sometimes made their appearance among the ragged and motley groups which visited our camps. A helmet-shaped cap of deer skin, fitting close to the head, and covered on the top with a bunch of feathers, is worn by many ; while others have straw hats, taken from the heads of Mexicans whom they have killed. Another and very picturesque ornament which the hatless and capless have recourse to, is a wreath of grass or leaves, twined around their heads and projecting well over their eyes, to protect them from the sun. The Mexican *serape* is also worn by those who have become the possessors of such a useful article of dress by murdering its former owner. The women wear jackets or tunics of deer skin, more or less ornamented, a profusion of beads, when they can

get them, and deer-skin leggins. Most of them wear unbleached cotton or calico shirts, which they obtain of the Indian traders or at the settlements.

Apache Head-dress and Boots.

On one occasion our camp was visited by a band of Navajo Indians, four hundred of whom were encamped on the banks of the Gila. This is a formidable, warlike, and treacherous tribe, which descend from their strongholds in the cañons west of Santa Fé, and rob the inhabitants of New Mexico of their cattle and sheep. They had heard of our party, and had taken advantage of the friendly manner in which the Apaches came to us, to accompany them. With the exception of a different style in their boots, and in the manner of arranging their hair, their dress appeared the same. Their bows, arrows, and lances were the same, and the helmet-shaped head-dress did not materially differ. The Navajos had a very fine description of woollen blanket of their own manufacture, which they use to cover their bodies when it is cold, as well

as for saddle cloths. These blankets are superior to any native fabric I have ever seen; in fact, they are quite equal to the best English blankets, except that they are without any nap. I have been told that they spin and dye the wool, which they raise themselves; though others assert that the richer colors are obtained by unravelling fine scarlet blankets of English manufacture, the threads of which are then used in the weaving of their own. Whether this is true or not I am unable to state. At any rate, even if true, this forms but a very small portion of the fabric, the remainder of which is undoubtedly spun and woven by themselves.

We had some little bartering with these people, giving them shirts and other articles of wearing apparel for their bows and arrows, and caps, and some of our party were so fortunate as to obtain some fine specimens of their blankets. I got a small one of inferior quality, but sufficient to show the style of their manufacture.

Many believed that the Navajos who visited us on the occasion referred to, were but spies to learn our numbers, and see whether any thing could be gained by attacking us; a belief in which I participated, and which subsequent events strengthened. We never saw them after.

July 5th. One of the cooks disappeared last night, taking with him a fine horse, one of Colt's large revolvers, and sundry articles of clothing. He was pursued by Mr. White and another, who overtook him on the plains two days after, recovered the horse and pistol, and left him to find his way to the settlements as he could.

On the 6th July, another incident of a more serious nature occurred, which bade fair to break up the friendly intercourse with our Indian friends, and bring us to open warfare. About one o'clock word was brought to me, that an Indian had been shot by Jesus Lopez, the Mexican teamster to whom I have before alluded. I at once ran to my door, and saw the greatest consternation in the place. The Indians, of which there were many about us at the time, were screaming and running in all directions, as though fearful of a general rising and massacre of their people. Our own party too were in great alarm, and every man ran for his arms, not knowing but that the Indians, who had so often been treacherously dealt with by the whites, might at once attack us, to be revenged for the loss of their companion. Mangus Colorado, Delgadito and Coletto Amarillo,* who were in our camp, seized their arms, and, mounting animals, retreated to a small hill a few hundred yards from the fort, where they stopped to see what was to follow, and make their escape in case of necessity. Many of their people crowded around them for protection and guidance. Some remained many minutes beckoning to them to come back; and assuring them that they would not be hurt. They remained quiet until Colonel Craig, with the courage and resolution which he exhibited in every trying scene, advanced alone towards them, told them he and all of us were still their friends, and

*These it will be perceived are all Spanish names: Mangus Colorado, meaning *Red Sleeve*; Delgadito, *slender*; and Coletto Amarillo, *yellowtail*.

invited them to the garrison where the man who had shot one of their people should be brought before them. They at once came forward ; and while we all stood on the parade ground in front of the garrison, the prisoner was brought up with his feet in chains, by a file of soldiers. We then passed in to the quarters of Colonel Craig, for an examination of the case. On questioning the prisoner why he had shot the Indian, he made no reply, except to say on returning from the Mimbres, some Indians whom he met had threatened to kill him ; although he did not pretend to say that the man he had shot was the one.

It appeared on examination, that Gordon, a cook, was the only person who witnessed the affair. He states that there was some dispute between Jesus and the Indian, about a whip belonging to the latter, and which the former wished to buy. Jesus had the whip under his arm, and on failing to agree about it, the Indian attempted to pull it from him. The Mexican, becoming enraged, first picked up a stone, and then seized his rifle. He levelled it at the Indian, when scarcely beyond the reach of the muzzle, and deliberately shot him down, the ball passing through his body just above the heart. Jesus ran to the Indian's horse which stood near the tent, intending to make his escape. Mr. J. B. Stewart, who was not far off, and heard the report levelled his rifle, threatening to shoot him if he stirred. The fellow stopped, and the next moment was a prisoner. When these facts were made known to Mangus Colorado, and the other chiefs present they were satisfied that the Americans were in no way implicated in the affair, and that it was

a private quarrel between a Mexican and an Indian. They were equally satisfied when assured that the prisoner should be kept in chains, and punished if the man died; and the conference ended in good feeling. The chief, *Ponce*, made a long speech on the occasion, and said they "all believed it the work of one bad man, and that the Commission had nothing to do with it." "If the man died, they should require the punishment of the murderer. If he lived, the Mexican should be compelled to labor, and the proceeds of it be given to the family of the wounded man, as a remuneration for the loss of his services."

The wounded man was taken to the hospital where he was attended by the surgeons of the Commission and the escort, and the best possible care taken of him. His wife and mother were in constant attendance, and his friends had access to him at all times. The chiefs were in daily, and expressed their satisfaction with my course. The poor man lingered for a month when he died. I ordered a coffin made for him, and intended having him decently buried; but his friends, refusing both the coffin and burial, laid him across a mule and carried him to their camp for interment, according to their own customs.

The Indians now waited upon us in considerable numbers, accompanied by their chiefs, and demanded that the prisoner should at once be delivered into their hands. I told them that as the offence was committed in our territory, the man must be punished according to our laws. Most of the chiefs were assembled on this occasion, and presented a strange and picturesque appearance, as they were distributed about

my quarters in various attitudes. Some standing, others sitting on benches, while the larger number adopted the common Indian position of sitting on their haunches with their knees drawn up before them, clasped by their hands. Had there been room to lie down, that posture would have been preferred. They came professedly as advocates of the woman's cause, and would listen to nothing but the unconditional delivery of the murderer, preferring their demand with considerable eloquence. Three or four would start upon the same point together, and he who could talk the fastest would be allowed to go on with the subject. As in the former controversy with these people, the arguments between the chiefs and myself were taken down. I began by addressing them through Mr. John C. Cremony, the interpreter of the Commission, as follows:

“I feel sad, as well as all the Americans here, and sympathize with our Apache brothers for the death of one of their braves. We were all friends. The dead man was our friend, and we regret his loss. I know that he had committed no offence; that he even did not provoke the attack upon him. But our Apache brethren must remember that it was not by the hand of an American that his death was caused. It was by a Mexican, though a man in the employ of the Commission. For this reason it is my duty to see justice done you, and the murderer punished.

“I am here, as I have told you, in command of the party engaged in making the dividing line between the United States, the country of the Americans, and Mexico. I have explained this to you fully before,

which you now understand. Beyond this I have no powers. The great chief of the American people lives far, very far, towards the rising sun. From him I received my orders, and those orders I must obey. I cannot interfere in punishing any man, whether an Indian, a Mexican, or an American. There is another great chief who lives at Santa Fé. He is the governor of all New Mexico. This great chief administers the laws of the Americans. He holds a court wherein all persons charged with crimes are judged. He alone can inflict punishment when a man has been found guilty. To this great chief, this governor, I will send the murderer of our Apache brother. He will try him, and, if found guilty, will have him punished according to American laws. Such is all that I can do. Such is the disposition I will make of this man. It is all that I have a right to do."

Ponce. "This is all very good. The Apaches know that the Americans are their friends. The Apaches believe what the Americans say is true. They know that the Americans do not speak with two tongues. They know that you have never told them a lie. They know that you will do what you say. But the Apaches will not be satisfied to know that the murderer is punished in Santa Fé. They want him punished here, at the Copper Mines, where the band of the dead brave may see him put to death—where all the Apaches may see him put to death (making the sign of being suspended by the neck). Then the Apaches will see and know that their American brothers will do justice to them."

Commissioner.—"I will propose another plan to

the chiefs and captains of the Apaches. This plan is to keep the murderer in chains, as you now see him; to make him work, and to give all he earns to the wife and family of your dead brave. This I will see paid in blankets, in cotton, in beads, in corn, in money, or in any thing the family may want. I will give them all that is now due to this man, and at the end of every month, I will give them twenty dollars more in money, or in goods. When the cold season arrives, these women and children will then come in and receive their blankets and cloth to keep them warm, and corn to satisfy their hunger."

Ponce.—"You speak well. Your promises are fair. But money will not satisfy an Apache for the murder of a brave! No! thousands will not drown the grief of this poor woman for the loss of her son. Would money satisfy an American for the murder of his people? Would money pay you, Señor Commissioner, for the loss of your child? No! money will not bury your grief. It will not bury ours. The mother of this brave demands the life of the murderer. Nothing else will satisfy her. She wants no money. She wants no goods. She wants no corn. Would money satisfy me, *Ponce* (at the same time striking his breast), for the death of my son? No! I would demand the blood of the murderer. Then I would be satisfied. Then would I be willing to die myself. I would not wish to live and bear the grief which the loss of my son would cause me."*

* This son of *Ponce* was the finest looking man we saw at the Copper Mines, and the greatest rascal. In an attempt some months

Commissioner.—"Your words are good and true. You speak with a heart full of feeling. I feel as you do. All the Americans feel as you do. Our hearts are sad at your loss. We mourn with this poor woman. We will do all that we can to assist her and her family. I know that neither money nor goods will pay for their loss. I do not want the Apache chiefs, my brothers, so to consider it. What I propose is for the good of this family. My wish is to make them comfortable. I desire to give them the aid of which they are deprived by the loss of their protector. If the prisoner's life is taken, your desire for revenge is satisfied. Law and justice are satisfied. But this poor woman and her family get nothing. They remain poor. They have no one to labor for them. Will it not be better to provide for their wants?"

The chiefs now exchanged views with each other, all having more or less to say; when Ponce, their principal speaker, said they had all agreed to leave the matter entirely with the mother of the deceased, and that by her decision they would abide. She evidently desired the life of the prisoner. Her desire for revenge or justice, was more to her than money or goods. The discussion was resumed.

Ponce.—"If an Apache should take the life of an American, would you not make war on us and take many Apache lives?"

Commissioner.—"No; I would demand the arrest of the murderer, and would be satisfied to have him

later to run off some mules, he received a rifle ball in his thigh, which or a while checked his thievish propensities.

punished, as the Apaches punish those who commit murder. Did not a band of Apaches attack a small party of Americans, my countrymen, very lately on the Janos road? Did they not kill one of them, and pierce three others with their arrows? And did they not take from them all their property? Yes; you all know it to be true, and I know it to be true. I passed near the spot where it took place, three days after. The Apaches did not even bury their victim; they left him lying by the road-side, food for the wolves and crows. Why do not the Americans revenge themselves on you for this act? They are strong enough to do it. They have many soldiers, and in a few days can bring a thousand more here. But there would be no justice in that. The Americans believe this murder was committed by your bad men; by cowards. The Apaches have bad men among them; but you who are now with us are our friends, and we will not demand redress of you. Yet, as I told you before, you must endeavor to find the men who killed our brother, and punish them. Our animals feed in your valleys; some of your bad men might steal them, as they have already done; but the Americans would not make war on you for this. We hold you responsible, and shall call on you to find them and bring them back, as you have done. While the Apaches continue to do this, the Americans will be their friends and brothers. But if the Apaches take their property and you do not restore it, you can no longer be the friends of the Americans. War will then follow; thousands of soldiers will take possession of your best lands, your grass valleys, and your watering-places. They will destroy every Apache

they find, and take your women and children captives.”

The discussion continued in this manner for two hours, the chiefs showing much sagacity in arguing their point. The matter was finally settled very much to my satisfaction, and apparently to that of the Indians, by my paying to the mother of the deceased thirty dollars in money, that being the amount due the prisoner. I furthermore agreed to pay her twenty dollars a month, hereafter, the amount of the prisoner's wages. Thus was terminated this unfortunate affair, which, at one time, seemed about to destroy the good understanding which had existed between the members of the Commission and our Indian friends.

CHAPTER XV.

INCIDENTS AT THE COPPER MINES.

Arrival of Mr. A. B. Gray—Meeting of Joint Commission—Objections of Mr. Gray to initial point—Mules missing—Arrival of Colonel Graham—Mules stolen from Fronteras—Descent of the Apaches on the Mule herd—Organization of parties for the Survey—Application to Colonel Sumner for more troops—Hostile attitude of the Indians—Second incursion of the Indians—Mules taken—Colonel Craig goes in pursuit—Arrival of Captain Buford with dragoons to our aid—Indians pursued by Colonel Craig and Captain Buford—Third incursion of the Indians—Volunteer party go in pursuit—Indians overtaken and cattle recovered—Apache chief recognized among the robbers—Determine to set out for the Gila.

ON the 19th July, Mr. A. B. Gray, United States Surveyor, Mr. Charles Radziminski, his principal assistant, and Lieutenant Burnside, U. S. Army, Quarter-master and Commissary, arrived. These gentlemen had come in the same party with Colonel Graham, whom they left at El Paso, and I felt greatly disappointed at the non-arrival of that officer, for whom more than two thirds of the Commission had so long been waiting to enter upon their duties. General Condé, the Mexican Commissioner, with some of his party, arrived at the same time, in order to make arrangements for going on with the Gila Survey, which had been so long delayed.

Mr. Gray presented his instructions from the Secretary of the Interior, and made known his readiness to

go on with his work. I therefore instructed him to organize a party for the linear Survey of the Gila, and to make the necessary arrangements for wagons, mules, horses, camp-equipage, subsistence, etc., which would be furnished him by the Quarter-master and Commissary, of the Commission. He lost no time in complying with my instructions, but at once selected his assistants, and prepared to take the field.

The day after the arrival of Mr. Surveyor Gray and General Condé, a meeting of the Joint Commission took place, when arrangements were entered into to commence the survey of the Gila, the General and his assistants, on the part of the Mexican Commission, undertaking the astronomical portion, while Mr. Gray, with his corps of engineers and surveyors, was to make the linear survey. We now only required the arrival of Colonel Graham to organize an astronomical force on the part of the United States.

On the 25th of July, Mr. Gray addressed me a letter objecting to the Initial Point agreed upon by the Joint Commission, at $32^{\circ} 22'$ north latitude on the Rio Grande, which had been established and marked on the 24th of April preceding, and from which the line had been extended west by Lieutenant Whipple. He advised a suspension of the work.

I replied to Mr. Gray, that on a further examination I was satisfied that the Initial Point on the Rio Grande had been established according to the treaty, and that I should adhere to the agreement entered into relating to it. I soon after, on the 8th of August, advised the Secretary of the Interior of Mr. Gray's objections.

On the receipt of my letter and the objections of Mr. Gray to the proceedings of the Joint Commission and the Initial Point as established at $32^{\circ} 22'$, the Secretary of the Interior, the Hon. Alex. H. Stuart, requested Mr. Gray "to remove the only obstacle which now exists to the completion of this branch of the work, by affixing his signature to the requisite papers." As this and other official documents are important for a clear understanding of this question, and as they are inaccessible to the large mass of readers, I have thought it best to append them at this place in the form of notes, without entering into any argument on the subject. The official acts establishing the Initial Point have been before given, and would be incomplete without the following letters, all of which have been printed in the documents of the United States Senate."

* Mr. Gray's letter of July 25th, 1851, containing his objections to the Initial Point may be found in Senate Document No. 119, 32d Congress, 1st Session, p. 279. My letter to Mr. Secretary Stuart, relating to the Initial Point, is contained in the same document, p. 145.

Secretary Stuart to Surveyor Gray.

DEPARTMENT OF THE INTERIOR,
October 31, 1851.

SIR: In relation to the temporary suspension of the work connected with the Mexican Boundary Survey, growing out of your refusal to affix your signature to the necessary papers establishing the Initial Point for the demarkation of the line at $32^{\circ} 22'$, you are informed, that inasmuch as the Commissioners appointed by their respective governments to run and mark the boundary line between the United States and Mexico were not necessarily constrained to suspend all operations connected with the Survey during your absence, and until your recovery from the

On the 28th July, several mules belonging to Colonel Craig, disappeared and could not be found; and as he believed the Apaches had been instrumental in driving them off, he determined to go in search of

indisposition with which you were afflicted, those officers progressed with the work intrusted to them, and fixed the Initial Point of said line on the meridian of latitude referred to.

As the Commissioners coincide in opinion respecting the correctness of their operations and their results, and are satisfied that the Initial Point has been accurately ascertained and determined, it is very desirable that the official documents necessary to the settlement of this important point should be at once perfected; you are requested, therefore, to remove the only obstacle which now exists to the completion of this branch of the work, by affixing your signature to the requisite papers.

I am, &c.,

ALEX. H. H. STUART,

Secretary.

A. B. GRAY, Esq.,

U. S. Surveyor, &c.

Secretary Stuart to Major Emory.

DEPARTMENT OF THE INTERIOR,

November 4, 1851.

SIR: I transmit herewith your commission as Surveyor, under the 5th article of the Treaty of Guadalupe Hidalgo, to run and mark the boundary line between the United States and Mexico, also a copy of a letter this day addressed to John R. Bartlett, Esq., United States Commissioner, containing explanations respecting your position and duties.

I also inclose a copy of my letter of the 31st ultimo, to A. B. Gray, Esq., late Surveyor; and in the event of his persisting in his refusal to affix his signature to the necessary papers for the establishment of the Initial Point for the demarkation of the boundary line as ascertained and agreed upon by the Commissioners of the two Governments, I have

them at once. On the morning of the 29th, he set off with thirty soldiers for the Apache Camp, on the Mimbres. On the appearance of a military force among them, the Indians became much alarmed, and assured

to request you will sign the official documents which have been prepared for the purpose, and which only require the signature of the Surveyor to settle this important point.

I am, &c.,

ALEX. H. H. STUART,

Secretary.

BREVET MAJOR WM. H. EMORY,
United States Surveyor, &c.

Mr. Gray having been removed before he had an opportunity to affix his signature to the boundary document as directed; Major Emory obeyed the instructions of the Secretary of the Interior, as appears by his letter to that officer, which may be found in Senate Doc. No. 6, Special Session, 1853.

Extract from Major Emory's Letter.

CAMP NEAR FORT DUNCAN,

October 1, 1852.

* * * On my reaching the ground to take charge of the Survey, November, 1851, I found that Mr. BARTLET and the assistant Surveyor had agreed upon the Initial Point, $32^{\circ} 22'$, and that a great stone monument had been erected, marking the point, and having the usual inscriptions, and the names of the American and Mexican Commissioners, Astronomers, and Surveyors.

The Surveyor (Mr. GRAY) came out long after the Initial Point was agreed upon, and the monument erected and the line begun, relieving the acting Surveyor (Lieutenant Whipple), and protested against the point. With the protest and the views of the Commission before him, both sides, it is presumed fairly stated, the Hon. Secretary instructed the Surveyor to sign the maps; but before the instructions reached him he was relieved, and I was appointed in his place, with the same instructions.

I therefore considered the matter as settled, and the action of the

the Colonel they had not been instrumental in stealing his mules, nor did they know any thing about them. Upon their promise to go in search of them, and if found to bring them in, Colonel Craig returned to the fort.

Government as final. The official documents which have been prepared for the purpose, referred to in my letter of appointment and instructions, never having been presented, no action has been taken in the matter definitely and finally to "settle this important point." I quote from my instructions, for as I shall presently show, it has, by the views taken of the subject by both sides, ceased to be an important point.

But I have done this in compliance with the letter and spirit of my instructions. Mr. SALAZAR, the Mexican Commissioner and Surveyor, met me at the Presidio del Norte, August 1st, to sign the maps of the Rio Grand—forming the boundary. Neither party had the maps properly prepared, nor was Mr. SALAZAR at all prepared in money or means to go on with the work at the rate I was progressing. I had already signed, conjointly with him, as astronomer and surveyor, the only maps fit for signature; but he remained pressing me to sign other maps which involve incidentally the Initial Point agreed upon by Mr. BARTLETT, Mr. CONDÉ, Mr. SALAZAR, and Mr. WHIPPLE, from which Col. GRAHAM had started his survey of the river. *I therefore, on the 28th of August, signed the maps according to my instructions, with the reservation contained in the paper, a copy of which is herewith sent, marked A., signed conjointly by Mr. SALAZAR and myself, and the statement therein referred to, setting forth on the face of the maps that it was the "boundary" agreed upon by the two Commissioners, April 20, 1851."*

I presume it was never intended I should give my certificate, as Astronomer and Surveyor, to the correctness of the determination of a point which had been determined by the observation of others, and without consultation or advice of mine. On the other hand, I do not for a moment doubt the power of the Government to instruct me on the subject, or hesitate as to my duty to obey its mandates, which I understand as requiring me only to authenticate the Initial Point agreed upon by the Commissioners of the two Governments.

In reference to the importance of the point, I think it as well to

On the 2d August, Colonel Graham, Principal Astronomer, Lieutenants Whipple and Smith, and several other gentlemen arrived, and encamped near the fort.

On the 7th August, word was brought me that eight or ten of our mules which were kept at the Astronomical Observatory at Frontera, near El Paso, had been stolen by the Indians; and the following day Lieutenant Green set off with a file of soldiers for Socorro, in order to intercept the robbers.

Four days after this, our camps were aroused with the news that the Indians had made a descent upon the mules belonging to Colonel Craig's command, which were grazing, in charge of three or four men, about a mile from the fort, and had run off about twenty-five together with some valuable horses. As soon as a party could be got ready they set off in pursuit, but after a few hours returned unsuccessful. One of the men who

state that the line agreed upon by the Commissioners, April, 1851, is about thirty-three minutes north of the line contended for as that laid down on DISTURNELL'S map, but reached about sixteen minutes of an arc further west; and as both lines run three degrees of longitude west, the difference of territory is three degrees of longitude, multiplied by thirty-three minutes of latitude, minus sixteen minutes of longitude, multiplied by about forty minutes of latitude, each having a middle latitude that may for the purpose of computation be assumed at thirty-two degrees. Neither line gives us the road to California, and the country embraced in the area of difference, with the exception of a strip along the Rio Grande about nine miles long and from one to two wide, is barren, and will not produce wheat, corn, grapes, trees, or any thing useful as food for man or for clothing.

Neither line will give a channel of communication for posts along the frontier, without which it is impracticable to comply with the eleventh article of the treaty, which engages the United States to keep the Indians out of Mexico.

was left with the mules was missing; but whether he was killed or taken away prisoner, is not known. He was never seen or heard of after.

The manner in which the theft was accomplished, was thus related to me by one of the herders: The animals were grazing in a little valley, surrounded by low pine trees and scrub oaks, when on a sudden a party of Indians who had approached unperceived among the trees, which were here very thick, rushed among the herd, set up a whoop that frightened the timid mules, and drove them off. The Indians were all mounted; and before the herdsmen could gain their saddles, they had the mules and horses on the full run before them. The herdsmen had no resource but to collect such animals as were left, and hastened with them to our camp.

On the arrival of Colonel Graham, as mentioned above, arrangements were entered into as soon as possible for going on with the work which had been so long delayed in consequence of his absence, and that of Mr. Gray. One astronomical and two surveying parties were organized for the survey of the Rio Grande, all of which were to be under the direction of Colonel Graham. The work was to be commenced at the Initial Point, and carried to the mouth of that river. The astronomical party for the survey of the Gila was placed in charge of Lieutenant A. W. Whipple; while that for the linear survey remained under the principal Surveyor, A. B. Gray, Esq.* With this organization

* Although I have embraced in this narrative the particulars relating to the establishment of the Initial Point, I do not think it proper to

we hastened to get our wagons, mules, tents, camp equipage, provisions, etc., ready in order to take the field as soon as possible.

While these arrangements were in progress, I sent a messenger to Santa Fé, with a letter to Colonel Sumner, commanding the troops in that military division, with a request that another company might be furnished me for an additional escort. This, on consultation with the army officers, was deemed actually necessary. Our present escort had been greatly reduced by desertions and sickness, so that there were less than forty effective men. We were now about to

enter into the particulars of the serious difficulties which took place between the Principal Astronomer, Colonel Graham, and myself, immediately on his arrival, growing out of his extraordinary and inexcusable delay of more than nine months from his appointment, in reaching the field of operations, and of his assumption afterwards. Never, in the whole course of my life, have I been placed in so trying a position. But such were my instructions, and such my responsibilities as head of the Commission, that I must either maintain this position, or, in succumbing to the demands of Colonel Graham, make myself and the Chief Surveyor, Mr. Gray, subordinate to him, resign all power and control on the members of the Commission, and become a mere nullity. I preferred the former alternative; and in order to lay the matter before the Government, and abide its approval or disapproval, I sent Mr. Charles Radzimirski, the Principal Assistant Engineer, to Washington with my dispatches. These unfortunate difficulties with Colonel Graham, most of which was owing to contention for rank and position between Mr. Gray and himself, greatly retarded the progress of the Survey, and caused much suffering to the parties engaged on the Gila portion of the work. The Government sustained me in my position, and removed Colonel Graham, appointing Major W. H. Emory in his place. The Correspondence on this subject may be found in Senate Document No. 119, 32d Congress, 1st Session—and particularly in my Dispatch to the Hon. Secretary of the Interior, No. 21, page 433 of the same document.

enter a field in the midst of hostile Indians, where we should be divided necessarily, into several small parties, thereby subjecting ourselves to the danger of losing our animals as well as of being attacked unawares. Before leaving Washington, the Secretary of War directed the Commanding Officer at El Paso, to detail an additional company for the escort, in case the Indians "have assumed a more hostile attitude towards the Americans, in the region through which the lines of the Survey are to be made." I now believed that such an exigency had occurred; for more robberies had been committed on the frontier than for some time previous, and the Commission, as well as its escort had met with losses within a few days, which showed that either the Apaches or some other tribes entertained inimical designs towards us. But my request was not complied with.

Since the visit of Colonel Craig to their camp in search of his mules, the Indians had been more reserved, and for a week previous to the 17th August, none had visited us. On the afternoon of that day a man who had been herding the mules and cattle about six miles from the Copper Mines, suddenly rode in with the news, that a descent had just been made upon them by a band of Indians, and that about fifty of the best mules had been driven off. Our men fortunately secured between seventy and eighty, by driving them into a corral or inclosure as soon as they discovered the enemy. But the rest were past recovery; for had the men attempted to pursue them, they would have been overpowered, and have lost the remainder of the stock.

As may be supposed, this news produced a great excitement in our camp. Immediate preparations were made to pursue the robbers, and Colonel Craig with his usual promptness set off at midnight, with between twenty and thirty men, which were all that we could mount. Unfortunately we possessed few good horses, and there was no alternative but to mount the soldiers on mules. My only hope was that the Indians would not go far, finding they were not at once pursued, which would enable Colonel Craig to overtake them, or surprise them in the camp. He soon struck the trail of the robbers, to which he was guided by Tucker, one of the herders who had followed them for several miles. About thirty miles beyond the Gila, the Colonel surprised two camps; but discovering his approach, the Indians made off, and, by scattering in every direction, as is usual in such cases, eluded further pursuit. Their fires were still burning, with mule meat and corn half roasted about them. His men also found some blankets such as are made by the Navajos, which caused him to attribute the robbery to that tribe. The Navajos were known to be in force to the amount of about four hundred near the Gila, and I believed the Colonel's inference to be correct.

On the day this robbery took place, I sent a messenger to Major Shepard, commanding at Doña Ana, advising him of the depredation of the Indians, and soliciting such aid as it might be in his power to extend to us in the emergency. He promptly attended to my request, and on the 22d instant Captain Buford arrived with his company of forty Dragoons.

The following day Colonel Craig again set out with some eight or ten men, being all that he could mount, together with Captain Buford and his command. A few civilians joined the party as volunteers. All were well mounted and armed, and carried their provisions and camp equipage on pack mules. They took no tents, and as little baggage as possible.

The loss of so many animals at this particular juncture was a most serious additional impediment to the movements of the Commission. We had had no more than were absolutely necessary, and now some of the parties must necessarily be delayed until others could be procured. Nevertheless, I was determined to get off, if we had any means of going, and the necessary preparations for the journey proceeded. That General Condé might not be disappointed by my not meeting him at the Burro Mountains according to agreement, I despatched Mr. James Steele and Mr. Scott, assistants in the Surveying corps, to his camp to make known to him our losses by the Indians, which might delay us a few days beyond the time. But we had not yet got through our troubles.

On the morning of the 24th August, the alarming intelligence was brought us, that the Indians had entered the valley where the animals were grazing, about half a mile from the fort, and had run off all the mules and horses belonging to Colonel Craig, together with the eighteen mules used by Captain Buford, to transport his wagons from Doña Ana. Great consternation was caused by this news, particularly as it was followed by a report that the Indians were endeavoring to drive off our cattle, of which we had nearly a

hundred head. We seized our arms, and ran to the hills near the cañon, where we discovered the cattle urged on by the herdsmen, and making through the trees and bushes for our camp, where we soon had the satisfaction of seeing them safely inclosed. An hour later we heard that a descent had also been made upon the horses and cattle belonging to Mr. Hay, who with a small party, was engaged in working the gold mines, four miles distant; and soon after the family of this gentleman, arrived with all their effects, corroborating what we had heard. They informed us that all Mr. Hay's cattle had been run off, and that he and his people had armed themselves and gone in pursuit. A volunteer party from the Commission soon joined them, embracing some fifteen or twenty persons, and among them Lieutenant Whipple. They pressed the Indians so hard that they overtook them just at dark, after a flight of thirty miles. As in the former instance, they abandoned the cattle, and scattered in all directions. The cattle of Mr. Hay, twenty-two in number, were recovered; and a horse and mule belonging to the Indians were also taken. The party with the mules having two hours the start, could not be overtaken.

Our place was now in a state of siege. The camps of the several surveying parties, which had been scattered through the valley, were brought into the neighborhood of the fort; picket guards were stationed upon the commanding eminences; arms were cleaned, and ammunition distributed; and every precaution taken to repel an attack; for it was thought that the Indians, who are ever on the alert, seeing so large a

force leave the place, might suppose it defenceless, and make a descent upon those who remained.

There could be no doubt as to who the depredators were in this case, as Mr. Hay was present when his cattle were taken, and had a parley with the well-known chief, Delgadito, who stood at a distance beyond the reach of his rifle. These robberies were, therefore, committed by the very Indians who had been fed by us, and had received every kindness at our hands. We had the charity, however, to believe that they were set on by the Navajos, as it was predicted that the appearance of this tribe boded no good.

About one hundred and fifty animals had been stolen, a part of them almost within sight of the fort; showing, if it needed any demonstration, the utter uselessness and inefficiency of our infantry escort for such a service. Had my last application for a company of dragoons been complied with we should have saved these animals; as my messenger had returned from Santa Fé before any robberies had been committed, except that of the few mules lost by Colonel Craig in July.

In consequence of our last loss, Lieutenant Green informed me that it would be impossible to furnish the escort required for the protection of the Gila party, as he was deprived of all means to transport their provisions and camp equipage, even though the men should walk. After the return of Colonel Craig, who might be absent two weeks, it would be necessary for Lieutenant Green to go to the towns on the Rio Grande to purchase a new outfit of mules and horses. In this state of things, it was evident that if

I waited for the escort I must delay my departure at least a month, thereby deranging the plans of the Mexican Commission by failing to keep my engagement with them, and retarding our own work to so late a period that it might be impossible to complete the survey of the Gila before winter set in.

In the midst of all these difficulties, I determined to push forward with the work, and notified Mr. Gray and Lieutenant Whipple, the chiefs of the parties that were to accompany me, to be in readiness to leave on the 27th instant. Colonel Graham, whose parties had also been organized for the survey of the Rio Grande, and were then awaiting his orders to enter the field, informed me that he would accompany me to the camp of General Condé, in order "to pay his respects" to that officer, and to his friend Mr. Salazar.

At this time our supply of provisions at the Copper Mines was very limited; but as a train of wagons sent to our dépôt near El Paso for provisions was expected in three or four days, with an ample supply, I determined to start with only about ten days' rations of flour, sugar, coffee, pork, etc., leaving orders for the remainder to be sent forward immediately on its arrival. Of fresh meat we had an abundant supply, taking with us twenty-five head of beef cattle, and one hundred and eighty sheep.

CHAPTER XVI.

THE COPPER MINES TO RIO SAN PEDRO.

Organization of parties for the Survey of the Gila—Leave the Copper Mines—Pack-mules—Mode of Packing—Ojo de Vaca—Camp in the Burro Mountains—Ojo de Inez—Grizzly Bear—Violent rain—Heavy travelling—La Piloncillo, or Sugar-loaf Mountain—Broad plain—Camp at El Sauce—Man missing—Camp in the Chiricahui Mountains—Boggy road—Want of water—Dry lake—Reach the Mexican Camp—Meeting of the Joint Commission—Mr. Gray's objection to the Boundary—March resumed—Mules abandoned—Reach San Pedro River—Its character.

THE journey we were now about to undertake was entirely different from any we had yet made. Since leaving the coast in Texas we had, except for eight days, followed a well marked and beaten road, practicable for wagons, and which was constantly followed by trains of emigrants passing to California. Now we had first to traverse a broad tract of country between us and the Gila, where there was no road, or even a trail; ignorant as to the existence of water or grass, or even whether it would be possible to reach our place of destination with the wagons. It was necessary to strike the Gila near the point where it is intersected by the western boundary of New Mexico, or in longitude $109^{\circ} 47'$ west from Greenwich. It was known that this river had its rise in lofty mountains, through which it ran for nearly two hundred miles of

the portion to be surveyed; and hence our uncertainty as to the best mode to be adopted for conveying our equipage and supplies. As the Copper Mines are at an elevation of six thousand two hundred and fifty feet above the level of the sea, there must necessarily be great descents before reaching the lower plains. But the great advantage which wagons possess over every other means of transportation, where it is possible to get through with them, induced me to use them as far as possible, at the same time keeping well provided with pack-mules in case of emergency.

The parties for the survey of the Gila were organized as follows:

ANDREW B. GRAY, *U. S. Surveyor in charge of party for the Linear Survey.*

JOHN BULL,	}	<i>1st Assistants.</i>
J. H. PRIOLEAU,		
MALCOLM SEATON,	}	<i>2d Assistants.</i>
JAMES STEEL,		
JAMES T. SCOTT,		
WM. A. TAYLOR,		

WILLIAM BAUSMAN, *Clerk and Assistant.*

Eight laborers and servants; two stonecutters; one blacksmith; one carpenter; two cooks; three arrieros, and one teamster.

LIEUT. A. W. WHIPPLE, *Topog. Engrs. in charge of the Astronomical and Topographical party.*

HENRY C. FORCE,	}	<i>Assistants.</i>
FRANK WHEATON,		
HUGH CAMPBELL,		
JOHN O'DONOGHUE,		

Three instrument carriers ; five laborers and servants ; two cooks ; three arrieros and herders ; one teamster. To drive the twenty-five head of cattle and one hundred and eighty sheep, three men were employed.

My immediate party consisted of the following :

THOMAS H. WEBB, *Secretary of the Joint Commission, Surgeon, and Mineralogist.*

JOHN C. CREMONY, *Interpreter.*

HENRY C. PRATT, *Draughtsman.*

GEORGE THURBER, *Quarter-master, Commissary, and Botanist.*

JOHN J. PRATT, *Assistant* (afterwards transferred to Lieutenant Whipple).

One cook ; two laborers and servants ; three arrieros.

The whole party, including myself, made fifty-seven persons, to which I must add the captive girl, Inez Gonzales, whom I meant to send to her family at Santa Cruz when we should be near that place. My original intention had been to take the larger portion of the military escort with me ; and Colonel Craig had made his arrangements accordingly, and intended to accompany it himself, leaving Lieutenant Green with a small detachment for the parties on the Rio Grande, with the hope that additions would be made to it as soon as the recruits came out. But his plans, as well as my own, were frustrated by the depredations of the Indians. To have waited until Colonel Craig could make good his losses would have deferred the expedition for a month at least. I therefore thought it best to hasten on and fulfil my engagements with the Mexican Commission, and then proceed to the Gila and commence the survey. I requested Colonel Craig with

his escort to accompany the train of provisions, which was to follow by the California road under the charge of Captain Barry, and to join the surveying parties at or near the Pimo Villages, on the Gila. This would enable him to send to the settlements and get his mules before our train would leave; and the surveying parties would merely be deprived of his protection until they should reach that point.

On the morning of the 27th of August, every thing was in commotion in our several camps, each party making their own arrangements for departing. A full day's march was not contemplated; to leave our camp and quarters, to get our wagons, mules, tents and camp equipage together, and get a start, was all that we expected to accomplish the first day.

We had not before used pack mules; so that this portion of our train and its preparation was a novelty to us.* The mules are first driven up, brought into a line, and tied. The packs for each are arranged, so that each may carry the same weight, and such articles are selected to accompany each other as will ride best together. Thus two trunks or panniers of equal weight are placed together for one animal—cooking utensils in hampers for another—tents, poles and bedding for a third—provisions according to their bulk and weight for others, and so on. These are arranged with much care, and the *arriero* or muleteer, endeavors to preserve the same load for each mule as long as he can.

* Pack mules are not used in Texas, in the northern portions of Chihuahua, and but little in New Mexico, as the country can be every where traversed with wagons. The poor farmers, however, use them as well as jackasses to carry wood, and for transporting small loads.

This saves much time in packing, and avoids confusion. The *aparejo* or pack-saddle, is a heavy, clumsy affair, stuffed with hay so as to form a large pad on each side of the animal, to protect him from his heavy burden, and weighing from thirty to forty pounds. When all is ready, a blinder is slipped over the eyes of the mule, which renders him perfectly docile. The cumbrous saddle is then thrown over his back, and bound with lashings so firmly, that the body of the beast is brought into the shape of an hour-glass; after which the load is laid on and secured by a mysterious combination of cords, which none but an *arriero* can comprehend. These are tightened by the united efforts of two men, who, with one foot against the saddle, pull away with their utmost strength. The groans and grunts of the animals as the cords tighten upon them, the jokes and shouts of the *arrieros*, and occasionally the antics of a beast that for a moment has regained its liberty, form a scene which is ever novel and amusing. Now and then, after every thing has been arranged, and a mule has been suffered to walk off with his load, he will lie down and roll, displacing his pack, and putting every thing in disorder. All has then to be taken off, and the process repeated *de novo*. The *arrieros*, who are all Mexicans, form a peculiar class, who differ as much from their countrymen, as sailors with us do from landsmen.

Soon after 12 o'clock I left the Copper Mines, in advance with my immediate party, intending to stop at some convenient watering place for the rest. We were all mounted, including the captive girl, who was placed on a very gentle mule. All the baggage, camp

equipage, and a portion of our subsistence was carried on the mules. I also had with me a Mexican lancer, whom General Condé had sent to direct us to his camp and to the watering places on the route. When about six miles out I received word from Mr. Gray that, owing to the heavy load in his wagon, he should be unable to go as far as we had intended, and wished me to encamp soon; besides which, one of his teamsters had refused to proceed. As it was impossible to send him a man, I ordered that the prisoner Jesus should be set at liberty, and should join Mr. Gray. I felt no longer bound to keep this man in chains and at work, for the benefit of the Indians, who by their robberies had forfeited all claim on me. Nor could I send him to Santa Fé for trial. He had behaved himself well ever since; and as our post at the Copper Mines would soon be broken up, I thought it best to take him with us.

Being near a spot where there was water and grass, we made our first encampment. Lieutenant Whipple and Mr. Gray, with their parties, joined us in the evening. One of Lieutenant W.'s pack mules had started off from the train during the march and disappeared among the hills. Parties were sent in search but he could not be found. His pack contained the clothing of some of the party, and was a serious loss to them. We had much trouble with our own mules, which kept constantly breaking away; but they were all finally brought in and secured.

August 28th. After much time spent in refitting the packs to our mules, which were not yet fairly broken in, we again set out. We were now all toge-

ther, including Colonel Graham's party, which added considerably to our number. This officer had two wagons and an ambulance, several assistants, a corps of laborers, servants, cooks, and a military escort. The train now stretched out for a long distance, as the pack mules followed each other in a single file. The officers and men generally rode side by side; and as the whole party embraced upwards of seventy persons, our cavalcade made quite a respectable appearance. We stopped for an hour at *Pacheteju* to water our animals, and then pushed on to *Ojo de Vaca*, where we encamped. The plains to-day presented a very different appearance from what they did when we crossed them in May and June before the rains. They were now covered with a rich coat of verdure, and resembled the green hills and grassy plains of the North.

August 29th. From this place four roads diverge. To the north is the road to the Copper Mines, we had just traversed; eastward is the one taken by emigrants from New Mexico, and first opened to this place by Colonel Cooke, which continues south-westwardly to the Guadalupe Pass; and southward runs the road to Janos. Our course lay westward near the boundary line to a mountain range about fifty miles distant, where General Condé was encamped with the Mexican Commission awaiting my arrival. Leaving *Ojo de Vaca*, we struck across the open plain due west, to pass a spur of the Burro Mountains. Twelve miles brought us to this mountain, when the Mexican lancer said that by turning up a cañon or defile to the northward, we should find an excellent spring of water, and that none would be met with again for about forty

miles. We accordingly left the trail and followed him. In a short time we entered a narrow and picturesque defile thickly wooded with scrub-oaks. This we followed for about five miles, when it opened upon a beautiful grassy meadow about three hundred yards wide, in which were many fine springs. Here we encamped, near the base of the hills, and about three miles north of the line where the Mexican Astronomers had had their observing camp. After dinner I followed the valley up for a mile. The flat meadow-like appearance continued as far as I could trace it from the tops of the hills, hemmed in on both sides by mountains. This valley I am inclined to think extends to the Gila, and during heavy rains is covered with water. There is land enough here to support a few families, with excellent water and some wood; and it would be a good point for a station, in case a wagon road or railway should be constructed across this country.

The weather to-day was extremely warm, so that our captive girl has suffered much from the exposure to the sun. Named this spring *Ojo de Inez*, or Inez's Spring, after her. I believe it is known to the Mexicans as *Ojo de Gavilan* or Hawk Spring.

In the hope that we might be able to find a passage across the mountains, without retracing our steps through the defile by which we had entered, and thereby save some six or seven miles of a very bad road, I sent a small party out to search for a practicable route. Towards evening they returned and reported that they had found one.

August 30th. The defile through which we were

to pass, was about half a mile south of our camp. I rode in advance accompanied by several to reconnoitre, and followed by the pack mules. This enabled us to select the best route for the wagons, which brought up the rear. The course was very tortuous, but without a hill that required us to lock our wagon wheels.

As we emerged from the mountains I rode up to the top of a hill with two gentlemen, in order to obtain a better view of the country. While seated on a rock enjoying the prospect before us, we were startled by the appearance of a huge grizzly bear, about fifteen rods distant, advancing in our direction. He discovered us at the same moment we did him, and seemed quite as much alarmed, for he suddenly sheered and made his escape at full speed along the base of the hill. We ran for our arms, which we had left with our horses a few yards below; but before we could get them he was too far off for a shot. He crossed directly in the rear of the train, when he made for the hills, followed by several of the party. Coming to a steep ascent, he ran up it with as much ease apparently as he did over level ground, and soon disappeared. The bear has a great advantage over his pursuers in this respect, as his large and pliable feet, and huge claws, enable him to climb up the steepest acclivity with the same facility as a cat. The color of this animal was of a silvery gray, with a darker or a black stripe down his back.

On entering the plain, our course was west to the southern point of a short mountain range. The country was quite rough and intersected with deep gulleys. On passing this mountain we descended by an easy

and gradual slope to a vast open plain, uninterrupted by hills, and bounded on the west by a high range of mountains about twenty-five miles distant. North and south there were no mountains to obstruct the view. Our guide here pointed out to us *El Peloncillo*, or

Barro Mountains.

Sugar Loaf, a mountain of this form in the high range alluded to, with an opening near it, where he said General Condé was encamped. He told us we should find no water until we reached there, which it seemed impossible to do before dark. At 3 o'clock in the afternoon we encountered a violent shower of rain. A few of the party had been so prudent as to have their india-rubber coats behind their saddles; but many had left theirs in the wagons which were a mile behind,

and were consequently drenched to the skin. The rain had now made the plain so muddy, that we could evidently not reach General Condé's camp before night; yet Mr. Gray with some of the party who were in advance pushed on with that intention. About 7 o'clock, as we were plodding slowly along, we heard the report of a musket from the wagons in the rear; and taking it for a signal of trouble, we rode back to learn the cause. On arriving, we found that the mules had given out, that the wagons were fast in the mud, and that it was impossible to proceed farther at present. It still continued to rain; but there was no shelter at hand and no alternative but to encamp where we were. The tents were accordingly got out and pitched on the open plain, where at every step the foot sunk three or four inches in the mud. It was with great difficulty that the tents could be kept up, as the ground was so soft that the pins would not hold. But the more serious question was how to make a fire, with no fuel but wet bushes; for not a particle of wood could be found. Nevertheless this was accomplished after much perseverance; and the cup of hot coffee which was the result had a wonderful effect in reviving our spirits. We retired in the midst of the storm, expecting every moment that our tents would fall upon us, but they kept their position, and with the exception of being a little wet, we passed the night more comfortably than could be expected under the circumstances.

August 31st. Every thing having been drenched with the rain, we did not get off till after 9 o'clock. The travelling continued exceedingly heavy and the

mules showed signs of fatigue and the want of water. Our course still lay west for the "Sugar Loaf." We entered the defile by an easy and almost imperceptible ascent; and after winding along the valley, and crossing an arroyo, we reached the camping ground of General Condé. The camp, however, had been

Approach to Sugar Loaf Mountain.

deserted, apparently within twenty-four hours of our arrival. On looking around, we found attached to a pole a note from Mr. Steele, the gentleman I had sent from the Copper Mines to apprise the Mexican Commissioner of the cause of my delay. Mr. Steele stated that in consequence of the limited supply of water, which could only be obtained by digging in the arroyo, General Condé feared there would not be sufficient for us all, and accordingly had removed his camp to *El Sauce*, about twenty miles to the south. Thither he

wished me to follow him, believing there would be found an abundance of water and grass at that place. We pitched our tents here for the night. Latitude of the Sugar Loaf Mountain $32^{\circ} 20' 21''$ —Longitude W. from Greenwich $109^{\circ} 01'$.

September 31st. As our animals were greatly fatigued by the two last days' march without water, and with but little feed, it was thought best to remain here to-day to recruit them. Our bedding, being quite wet, was spread out to dry. To employ our time to the best advantage, Lieutenant Whipple was occupied in making astronomical and magnetic observations near the camp and on the summit of a high mountain about three miles to the north. This mountain was found to be 1750 feet above our camp and 2050 above the plain; the party was seven hours in ascending and returning. It presented a picturesque appearance, from the columnar and basalt-like position of the dark and light strata of which it is composed. I employed myself in examining the hills near, and in making a few sketches. There were but few trees here, and these mostly live oak standing in the valleys. The hills were quite bare. While engaged in sketching, halfway up the mountain, I was overtaken by a shower, from which I took shelter in a large natural opening in the side of a rock on the summit of one of the mountain spurs. The rocks here presented many fantastic forms. Among the crevices grew the fouquiera, with an occasional cedar, while the Spanish bayonet and yucca sprang up on all sides. In the distance, on the right, rose the Sugar Loaf Hill, near the base of which was our camp.

We found water by digging in the arroyo near our camp, though the supply was but limited. In my rambles among the hills I discovered several springs of running water; with a little labor therefore I have no doubt an abundance might be procured. In order to apprise General Condé that I was near, and should join him next day, Dr. Webb, with Messrs. Cremony and Thurber, rode forward to his camp.

Rocky Cavern, near Sugar Loaf Mountain.

September 2d. Mr. Steele and a Mexican soldier arrived this morning from General Conde's camp,

bringing me word that the General had again removed about twenty-five miles farther to the west, in order that he might be nearer the settlements; as he was getting short of provisions, and should be compelled to go himself or send there very soon for a supply. We left camp at 9 o'clock; Lieut. Whipple, with the wagons, retraced his steps about two miles, when he found an easy passage through the mountains. Mr. Gray and myself took the pack-mules, and, with the assistance of the Mexican guide, followed a shorter cut directly through the defile, where it was impossible for wagons to pass. Our route was tortuous and

Chiricahui Mountains.

hilly, hemmed in on all sides by lofty mountains. Two or three miles brought us to the opposite side of

the mountains, when a broad open plain appeared before us about twenty-five miles across, bounded by a lofty and continuous range known as the *Sierra Chiricahui*. Its course, like that of all the other long ranges we had seen, was from the northwest to the southeast, with an irregular and jagged summit, often exhibiting picturesque and fantastic forms. The plain that lay between us and the mountains was unbroken by a hill or a tree. At the northwest the view was limited by a very high mountain apparently seventy or eighty miles distant, which I supposed to be near the Gila. Both east and west of this mountain the country was open. In a southerly direction mountains

La Punta de Sauz Cienega.

were visible at a great distance. We entered the valley by a gradual descent. About one third the distance

across the plain, we struck a dry ravine. Following this some eight or ten miles, we reached *El Sauce*, or the Willow Marsh; which seemed to be the basin where the waters collected from the adjoining mountains and slopes. Here was a great abundance of water, which, from the rushes that grew on its margin, I suppose to be permanent. Grass was also plenty here. Lieut. Whipple by observation found the latitude to be $32^{\circ} 05' 09''$, longitude $109^{\circ} 02' 06'$.

September 3d. There was much alarm in camp this morning in consequence of the absence of John O'Donoghue, one of the computers, who left the track yesterday, and did not rejoin us. It had rained heavily during the night, with thunder and lightning, giving us a pretty thorough drenching, as our tents were in a low and unprotected spot. Sent three men and the Mexican soldier back to our last camp in search of O'Donoghue. The road was now very heavy; and so deep did the wheels sink into the earth, that it was with the greatest difficulty the wagons could be got along. Many times they became so deeply imbedded as to require the aid of several men to relieve them. The pack-mules also had to struggle hard to make their way over the miry soil. Our perplexities were increased by the many small ravines now partially filled with water from the late rains, where the wheels sunk almost to their hubs, rendering it necessary to double the teams in order to extricate them. After journeying in this manner for six hours, and making but twelve miles, we were obliged to stop and encamp without water. We had expected to reach the mountains, now but a few miles off, and did not take

the precaution to fill our water kegs. Fortunately we extracted enough from our canteens to make our coffee. One of the wagons got so completely bogged that it could not be extricated; so that I was obliged to send back some pack-mules to take the load, and let the wagon come in empty. Short as this day's journey had been, it was a very severe one on the mules. Latitude of this camp $32^{\circ} 08' 33''$, longitude $109^{\circ} 11' 32''$; course north-west.

September 4th. This morning the party sent in search of O'Donoghue returned. They had discovered his track, and traced him to the camp which General Condé had just left, where they found a note announcing his safe arrival there, and that he had kept on with the General and his party.

Continued our journey along the base of the mountains; the road still heavy, with frequent arroyos. These, when the banks are steep, are difficult to pass; and in crossing one of them a tongue of one of Colonel Graham's wagons was broken. The day was quite hot, and the poor mules seemed to suffer much from thirst. As we drew near to the mountains we discovered water gushing from their side. We therefore halted; and as the spring was at some distance above the valley, we had to take the mules from the wagons and with much labor lead them up to drink. This was so difficult that a portion of the party kept on, hoping soon to find a place where the precious beverage was more accessible. I observed one of the gentlemen clamber up the rocks and fill his leather cup with water, which he brought several times down the steep hill to give to his suffering horse. At one o'clock, we

turned short to the left, and entered a narrow defile with perpendicular sides, and soon after found ourselves in a beautiful amphitheatre among the mountains. Here we found the spot where the Mexican Commission had been encamped, and a note from Mr. Thurber, stating that in consequence of the limited supply of water they had still gone forward. I was greatly disappointed at this news, as there was every indication of the proximity of water in the many surrounding gorges and ravines. All were set about searching for it at once; and after some time thus spent, one of the men happily struck a trail, which he followed half a mile up a ravine, and there discovered a spring and fine pool of crystal water. No time was lost in driving up the mules, horses, cattle, and sheep, and we gladly pitched our tents near a beautiful grove of oaks. I regretted much that General Condé had not discovered this fine spring, the vicinity of which afforded the most eligible camping ground we had yet met with. Lieutenant Whipple observed here, and found the latitude to be $32^{\circ} 08' 43''$, longitude $109^{\circ} 24' 33''$.

September 5th. After a few hours' detention to repair Colonel Graham's wagon, we moved forward, and found the mountains more difficult to pass than any we had encountered before, consisting as they did of continuous hills, which required much care on the part of the teamsters; yet, with locking the wheels two or three times, and a little assistance by hand, we soon got through. The length of the pass, with all the sinuosities of our route, did not exceed three miles.

On emerging from the opposite side a broad plain

again opened to our view as before, with a range of mountains bordering its western side, about thirty-five miles distant, and running parallel with those we had just left.

This plain appeared, as it subsequently proved to be, destitute of shrubbery or trees, and covered with grass. It was without a hill, and extended in both directions from sixty to eighty miles. A dry lake appeared about midway in the plain; and a closer examination made by some of the party showed that there was water in some portions about two inches deep, but so brackish and muddy that even the cattle would not drink it. From our present elevation above the lower plain, we had a most extended prospect. At the south-west we saw a long line of trees marking a water course or arroyo, which we at first believed to be the San Pedro, though we afterwards found it was not the case. The plain being hard and smooth, with a slight descent, we pushed rapidly forward, and late in the afternoon perceived with our glasses the camp of General Condé, yet a great distance from us. Those who were mounted hurried on in advance of the wagons, and at six o'clock reached the camp, having been in the saddle eleven hours, without taking food, and exposed to a broiling sun. The wagons could not get in, but stopped about five miles back, when they were overtaken by the darkness of the night. The mules too were greatly fatigued.

The water here, which was taken from pools a mile from the camp, was found to be very bad. Not a shrub was to be seen; the grass was poor; rounded heaps of white sand, or patches of bare clay, appeared

in all directions. On the whole, we had not before been encamped in so miserable a place. The General had been led here by the report of the existence of a large lake, which turned out to be the dry bed I have mentioned. Finding it impossible to stop there, his men in searching further discovered the pools near which we were now encamped.

General Condé gave us all a warm reception, and invited the officers to his tent, where refreshments were served to us. Mr. Salazar, the Chief Astronomer of the Mexican Commission, arrived here to-day, having finished running the line of the southern boundary of New Mexico through its entire length of three degrees, as agreed upon by the Joint Commission.

September 6th. We were all glad to have a day of rest after our fatiguing journey, even in so desolate a spot. The weather was quite warm, and we felt the heat more than when moving. Our cooks had the greatest cause for complaints; as no fuel could be found but dried grass and stalks of the yucca. These would answer for nothing but to boil a pot; to bake bread was impossible.

General Condé had with him the whole Mexican Commission, consisting of seventy men, besides his officers. This included his military escort, who performed the duty of laborers, and assisted the engineers in the field. He informed us that he had been attacked by the Apaches when encamped at the Sugar Loaf Mountain. They approached, unperceived, within a quarter of a mile of his tent, and drove off his saddle-horses. Another party on the opposite side made a dash at his mule herd, which they

attempted to stampede; but the herders were so fortunate as to get the start of them, and succeeded in driving the animals safely into camp. On hearing of our loss at the Copper Mines the General had increased the guard over the mules, but for which he would have lost the whole.

A meeting of the Joint Commission was held to-day, at which all the members were present. On this occasion Mr. Gray first made known his dissent from the agreement entered into relative to the southern boundary of New Mexico, stating, moreover, that "his reasons, and his interpretation based upon them, had been referred to the Government, in pursuance of the 21st article of the treaty." General Condé remarked, that "this course did not agree with the stipulations of the 5th article of the treaty; and that the Initial Point had been determined, and the decision could not be reversed."

September 7th. The Joint Commission met again in my tent; but in consequence of Mr. Gray's illness, adjourned to his, where he and Mr. Salazar presented a plan for continuing the survey. This was adopted, and it was determined to enter upon the duty at once. Mr. Gray and Lieutenant Whipple, with their parties, were to run the Gila portion of the work on the part of the United States; while the Chief Astronomer was to have the entire charge of the Rio Grande survey on the part of the same. Mr. Salazar was to operate with the latter, and General Condé and his officers with the former.

The Mexican Commissioner announced his intention to proceed at once to Santa Cruz, the nearest set-

tlement in Sonora, for the purpose of obtaining a supply of provisions before he could go on with the work. As the American Commission was in a similar destitute predicament, and there was nothing here but brackish water, no wood, and very poor grass, it was determined to proceed without delay to the San Pedro River, one day's journey distant, and there await the arrival of the provisions which were to follow us from the Copper Mines; or, if supplies could sooner be got from Santa Cruz, to obtain them and then go to the Gila. The latitude of this place is $32^{\circ} 02' 38''$, longitude $109^{\circ} 48' 54''$.

September 8th. The backs of two of the pack-mules so much galled that they were abandoned here; and General Condé kindly loaned me two of his, to carry their packs. At 8 o'clock A. M. we again set off in a westerly direction, ascending very gradually to a gap in the mountain range, about fourteen miles distant, through which we hoped to find an easy passage. The opening did not disappoint us, as it was very level; but it was an arroyo deeply cut by mountain torrents rather than a defile, and consequently presented a continuous bed of sand and gravel for nearly twelve miles. Its precipitous banks excluded the air, so that the journey was a most disagreeable one. On emerging from the arroyo, we entered a plain, thickly overgrown with large mezquit bushes, but destitute of grass. We looked in vain for a line of trees, or of luxuriant vegetation to mark the course of the San Pedro, and began to fear that we might have still another mountain ridge and another plain to cross before reaching it, when all of a sudden we found ourselves upon its banks. The stream which resembled the Pecos in appearance,

though much smaller, was here about twenty feet across, about two feet deep, and quite rapid. The water, though muddy, was pleasant to the taste. We were all exceedingly fatigued with this day's march, having been eleven and a half hours in the saddle and travelled upwards of thirty miles. The latitude of this place by observation was $31^{\circ} 54' 31''$; longitude, west from Greenwich $110^{\circ} 11' 41''$.

CHAPTER XVII.

RIO SAN PEDRO TO SANTA CRUZ.

The valley of the San Pedro - Decide on going to Santa Cruz for provisions and mules—Departure of General Condé—Leave the San Pedro—Take the trail of the Mexicans—Deserted Indian village—Leave the trail—Wild horses—Santa Rita Mountain—Beautiful valley—Progress arrested—Critical situation—Mr. Thurber goes in search of Santa Cruz—Arrival of Colonel Graham—Ruined hacienda of Calabasa—Wild scenery—On short allowance—Return of Mr. Thurber—Retrace our steps towards the San Pedro—Mustangs—Camp on the Babocomori—Arrival of Mexican soldiers—General Condé loses his way—Sufferings of his party—Mexicans hunting cattle on the San Pedro—The father and friends of Inez Gonzales arrive—Set out again for Santa Cruz—Meeting of the captive girl and her mother—Arrival at Santa Cruz.

September 9th. The valley of the San Pedro River near our camp was any thing but luxuriant. It consists of a loam, which if irrigated might be productive; but as the banks are not less than eight or ten feet high, irrigation is impracticable, except by digging a canal a very long distance. The grass of the vicinity is miserably thin and poor, growing merely in tufts beneath the mezquit bushes which constitute the only shrubbery, and in some instances attain a height of ten or twelve feet. Low hills approached within a mile of the river on the east side, and on the west within a quarter of a mile of that distance. Finding it impossi-

ble to graze our animals here, I sent men up and down the stream in search of better grass, which they succeeded in discovering about three miles further south, with springs of water near. I therefore directed the camp to be removed there the next day.

General Condé called, and said he was about to leave with five men for Santa Cruz. In consequence of his offers of service, I requested him to engage for me some flour and beans, both of which I had been informed could be procured there; also to get me twelve mules, as I had just learned that four more of ours had proved unfit for use. General Condé said he had an officer with him who had resided in Santa Cruz some years before, and was well acquainted with the country; that we were not more than twenty-five miles off; and that he should reach there before night. I told him that I would follow him in the afternoon.

Having now decided to proceed myself to Santa Cruz for provisions and mules for the surveying parties, I directed the camp to be removed to the springs, three miles above, and there await my return, which at the farthest I believed would be in a week. This journey, too, would enable me to deliver to her parents the captive girl, who was yet with us. I took leave of Lieutenant Whipple, Mr. Gray, and Colonel Graham, when the latter informed me that he should strike Cooke's California road, which we believed came within a short distance from our camp, and return to the Copper Mines that way. At his request I furnished him with some sheep for his journey.

That no time might be lost, I directed the mules to be hitched up at once, intending to take one wagon

for the flour, and a few pack-mules to carry our tents, cooking utensils, and baggage. I hoped to overtake General Condé, but a shower came up, which made it necessary to delay our departure for a few hours. In order to cross the river, it was necessary to level the banks on both sides, and let the wagon down by hand. Our baggage, tents, &c., were all carried over on mules, so that it was five o'clock in the afternoon before we got off. Soon after, it commenced raining, rendering it very difficult for the wagon to get along. Our route lay along the valley due south, through a thick mezquit chapporal. There was no road; but the trail of General Condé's train was a sufficient guide. We had now a gloomy prospect before us; the rain was pouring down in torrents, the travelling was becoming more and more heavy, and the whole surface of the valley was completely deluged with water. Towards evening, finding a little gravelly knoll just large enough to pitch a couple of tents upon, we encamped. Ditches were now dug to lead off the water, and earth was removed to within the tents so as to make them tolerably dry. During the night it rained very hard.

September 10th. Mr. Salazar arrived in camp during the night, and remained with us. He was on his way to Santa Cruz. Resumed our journey at 8 o'clock. My party now consisted of Dr. Webb, Messrs. George Thurber, J. C. Cremony, Henry C. Pratt, John J. Pratt, Inez Gonzales, the captive girl, and myself. We had also one servant, one cook, one laborer, one teamster, and three Mexican arrieros, making altogether fourteen persons. Our course continued due south through thick mezquit chapporal, following the trail of General

Condé's party. After marching about eighteen miles the trail turned abruptly to the west, along the base of some high detached hills; these we followed about five miles, when we encamped near a water hole. There was here a collection of twenty or thirty wigwams, made of poles, bent over in a circular form and well thatched with straw, the whole so completely done that they must have been a permanent abode for their

Indian Wigwam.

occupants. From all appearances the place had been deserted a year or more. In the midst of these wigwams was a circular pit lined with stones, where the distilling of mezcal had been carried on, on a large scale. Inez said she had never seen such wigwams among the Apaches, and that it must have been a village of the Papagos Indians. There were many fragments of pottery scattered about.* Dr. Webb rode ahead with Mr. Salazar this morning, and did not rejoin us. He doubtless reached General Condé's party.

* I afterwards learned that this was a place where Papagos Indians resorted annually to collect the Maguay, and distil the liquor; and that about a year before our visit, they were surprised by the Apaches and some fifty men, women and children, killed or taken prisoners.

September 11th. We followed the wagon trail for several miles, till at length it turned off in a north-westerly course. At this I became uneasy, knowing that Santa Cruz, whither we were bound, lay to the south. Not knowing but General Condé might have gone that way to avoid some deep ravine, although I could see none, I came to a halt, and sent Mr. Cremony ahead for a mile or two to see whither the trail we were following led. He reported that it kept the same north-westerly-course, and seemed to be following a well-marked Indian trail. I now became satisfied that General Condé's party had mistaken their route, and that by following it, they must reach *Tucson*, a military post towards the Gila. I had now come, since I changed my course yesterday, about eight miles out of the way. I determined therefore to leave the trail and go south over an open plain, towards a high mountain; and this direction we pursued until four o'clock, when we encamped near a little pool of water. The whole face of the country had changed to-day, in fact since we had left the valley of the San Pedro. From that river we had ascended to a plateau of an undulating character, similar to the western prairies. It was covered with short grass; and in the depressions, some of which were fifty or a hundred feet lower than the plain, we found pools of water, more luxuriant grass, and groves of small oaks.

We saw for the first time to-day a herd of *mustangs*, or wild horses. They at first caused us much alarm, as we took them for a party of Indians; but a close examination with a spy-glass disclosed what they were. When within half a mile of them they dis-

covered us, and soon disappeared from view. Many deer and antelope were also seen.

On our right, about ten or twelve miles distant, a lofty range of mountains, one of which, towering far above the others, terminated in a peak. We afterwards learned that this was called the *Santa Rita* Mountain. It was altogether the most magnificent that we had seen. Spurs extend from it five or six miles towards the plateau, and its sides are deeply furrowed with gorges and ravines. At sunset, when a deep shadow was thrown over it, its appearance was truly grand. We all went up on the plateau to enjoy the scene, and Mr. Pratt devoted the daylight that remained to taking a sketch of it.

September 12th. On setting out we ascended the plateau again from our encampment, but dropped down soon after into a valley which extended several miles towards the south, its banks studded with oaks. The grass continued rich and abundant, with frequent pools of water from the washings of the adjacent hills. Six miles brought us to a hill some five or six hundred feet high, which lay directly across our path. In every direction, except around the western base of the hill on which we stood, arose higher hills and lofty mountains intersecting each other, and presenting an impassable barrier to our progress. After three hours' detention spent in search of a passage, we retraced our steps for a short distance, and by surmounting several low, though very steep hills, crossing many ravines, over which it was necessary for every man to put his shoulder to the wagon, and wading through a swamp, where the rank grass reached above our heads,

we succeeded in rounding the hill before referred to on its western side, and in dropping into the valley beyond. Here we found a small stream of clear and sweet water running through the valley. Pursuing still a course nearly south for about ten miles, we approached the base of the high and isolated mountain, when the stream and valley turned suddenly to the west. Continuing along it for a mile, we encamped near a grove of large cotton-woods, in the midst of tall grass, within a little nook protected on three sides by steep hills. Here we were admirably concealed from an enemy, except in front, where lay the valley and stream. The latter, increased by rains from the adjoining mountains, had now become a rapid stream, and was closely hemmed in by willows, which rendered it difficult of approach. The valley for the last ten miles of our march resembled an old and highly cultivated place, from which the people and their habitations had suddenly disappeared. Large cotton-wood trees and willow bushes lined the stream, while here and there in little groves were beautiful oaks and large mezquit trees; for the latter, although adapted to every soil, becomes a large tree in a rich soil like this. It seemed that each grove, as we approached it, must conceal some dwelling place and cultivated grounds; but in reality all was solitude, and there was no evidence that a furrow had ever turned the virgin soil, or a seed had even been sown there.

September 13th. Believing that by following the stream we should strike a road or path that would guide us to our place of destination, we continued our

course along the base of the low hills which bound the valley, but were very soon arrested in our progress. The valley gradually became contracted as the two great mountain ranges approached each other, leaving only a defile, about a quarter of a mile in breadth, through which the water had burst a passage. This defile was filled with gigantic cotton-woods, with an undergrowth of rank grass, weeds, and jungle, rising above our heads even when on horseback. Among them grew a vine, binding all together; so that it was impossible to force a passage through. Farther progress here was therefore at an end. But perceiving on the elevated ground of the side of the valley, a cluster of deserted adobe buildings, I sent a party across to see if there was any egress in that direction; while I went with Mr. Cremony and Mr. Pratt over the hills, and along the valley ahead. A few hundred yards before us a perpendicular wall of rock rose directly from the valley, or rather from the stream which ran at its base. The hills on all sides were steep, high, rocky, full of the most frightful chasms, and utterly impassable for a wagon. For the half mile that I went I had to lead my horse; and I doubted whether an animal under a heavy pack would be able to clamber the steep and rocky crags that lay in our way. The valley too, where I depended chiefly on finding a passage, had become an impenetrable swamp. From a high hill, which I ascended, it could be traced for a long distance by the bright green hue of its vegetation; but the rugged mountains hemmed it closely in, their summits, from the bird's-eye view I had of them, appearing like the huge waves of a tempestuous ocean, suddenly turned to stone. Frightful chasms where

mighty convulsions had rent the mountain asunder, and deep ravines worn by the torrents of centuries, appeared on every side. Bare rocks projected here and there, gray and mossy with age, and appearing like ruined castles. But amid all this sterile grandeur there was a rich and varied vegetation. The graceful agave thrust up its tall and slender stem from among the rocks; the yucca and Spanish bayonet monopolized as usual every spot where there was a few inches of earth or gravel; while the fouquiera with its thorny stems was well represented. Cedar and stunted oaks jutted from many little depressions where there was sufficient soil to give them a foothold.

Mr. Thurber, who went to examine the opposite side of the valley, reported that a passage for mules might be found in that direction by following an old Indian trail which passed the ruined hacienda; but for a wagon no egress could be discovered. No alternative now remained but to retrace our steps with the wagon, or to transfer its contents to the banks of the mules and abandon it. I decided on the latter course. Being without pack-saddles, we took as substitutes our tents and wagon cover, which were folded in a convenient form and laid over the mules' backs. Our blankets were converted to the same use; and then five mules were prepared for their loads. The contents of the wagon were then put upon the mules and fastened as securely as possible. The next thing to be done was to cut a passage through the jungle with axes, to enable us to cross the stream and valley. This being accomplished, we moved off, leaving the wagon, harness, tables, camp-stools, and such other articles as we could dispense with without serious inconvenience.

On reaching the stream, one of the men led the way, followed by one of the pack-mules. The creature sank deep into the mud; but with a good deal of struggling on its part, and urging on that of the arrieros, it got safely across, the pack turning as soon as the mule reached the bank. The next two fell in the middle of the stream, and became fast in its soft and muddy bottom, their packs falling over into the water. After unavailing efforts to get them along, and fearing they would drown themselves in their struggles, the packs were cut loose and taken off; and then, with several men in the water lifting, and others on the bank pulling, the mules were released from their miry beds and brought back to the firm soil. My own baggage and papers got drenched as well as most of the blankets and bedding of the party. Some of the horsemen in attempting to cross, also mired; and as we had six more pack-mules to get over, I abandoned my efforts; not so much from the difficulty of passing the stream, as of keeping the packs on the mules without ropes. The straps and rigging of two mules had been ruined in our exertions to save the animals. We now returned to our abandoned wagon; and finding it impossible to proceed, I determined to send a party by the trail discovered near the old hacienda, to Santa Cruz, for a guide, and such aid as would enable us all to reach there. I believed that this place was now within ten or twelve miles of us, and that a party going south, must strike the emigrant road to California, which passes through it.

Mr. George Thurber at once volunteered on this duty, in which he was joined by Mr. J. J. Pratt. A

Mexican arriero accompanied them to take care of their animals, and render such aid as they might stand in need of. Within an hour after this had been determined on the party were off; and as they believed they could reach Santa Cruz before night, they took with them merely a supply of bread for a couple of days. When they had left, we removed from the dense thicket around us, and retraced our steps about half a mile; we then pitched our tents between two spurs of the mountain, where we could not be discovered, except from the front. The cotton-wood trees in the spot where our march was arrested were the largest we had ever seen. I measured the girth of one, about five feet above the ground, and found it twenty-eight feet. Its limbs spread full forty feet on every side, and a large party might have encamped beneath its ample shade.

In the afternoon we were surprised by the appearance of a man on horseback coming at full speed towards our camp. He proved to be Guadalupe, one of Colonel Graham's servants, who, greatly to my surprise, informed me that the Colonel was following my trail on the way to Santa Cruz; that he was very short of provisions; and that he (Guadalupe) had hoped to reach there in advance and obtain some, in case I could not furnish them.

September 14th. We now found ourselves very short of provisions; for, relying on the Mexican's assurances on the San Pedro that we were within twenty-five miles of Santa Cruz, I had provided myself with only five days' supply of flour, and three of meat, with other necessaries for a week. As soon as I dis-

covered that we should not reach there as soon as anticipated I cut down the daily allowance of flour one half. Our meat being fresh, was soon exhausted; so that by this time our supply of every thing was very scanty. Several of us set out in search of game; but although deer were seen, we were not fortunate enough to kill any. I perceived the traces of turkeys among the cotton-wood, and watched for hours beneath them; but they came not. Mr. Pratt rigged up a fishing line to try what he could find in the brook. His labors were attended with success; and our dinner table was served with a plentiful supply of trout, which, though small, were a welcome addition to our bill of fare. We also found near the camp an abundance of purslain (*portulacca*). This was collected and boiled, and formed our chief food. In the absence of vegetables, which we had not tasted for a long time, we all relished it very much.

September 15th. Colonel Graham and his party joined us this morning. He came a few hours in advance, with Messrs. Wright and Clarke, in consequence of the sad tale brought back by Guadalupe, who told him we were "*half starved and living on roots.*" The Colonel brought us his haversack filled with bread and meat, and a bottle of wine. He himself was quite short of provisions, though much better off than we were; and having killed a bear in his journey, he had had an abundant supply of fresh meat. This kind of meat, however, will not keep, and is not good after the second day, except in cold weather.

I took my rifle and went out again in search of game, following a deep ravine far up towards the

Santa Rita Mountain, and was so fortunate as to get a shot at a turkey, which I brought down. He proved to be a very large one, and a pretty good load to trudge over the hill and rocks with. This gave us all a fine dinner. Sent all hands out towards evening after game, but none was found.

September 16th. On examining his provisions, Col. Graham found he had sufficient to give all half allowance of flour for six days, which was accordingly distributed, and proved very acceptable. He also had a little salt pork, but no sugar, tea, or coffee. These things we had not tasted for many days. But with half an allowance of flour, and as much purslain as we could eat, we did not suffer much. Our fare to be sure was humble enough; but I am sure we relished it infinitely more, and felt more thankful for it too, than those whose tables are loaded with every luxury, and still have to resort to artificial means to increase the appetite. My mess was now reduced to four, viz., Mr. Cremony, Mr. Pratt, the fair captive, Inez, and myself.

Colonel Graham set off this morning to reconnoitre the country a few miles to the south, while Mr. Pratt and myself crossed the stream, and ascended the mountain on the opposite side. We also examined the ruined hacienda, before spoken of, which seemed to have been abandoned many years before, as much of its adobe walls was washed away.* Our reports coincided as to the utter impossibility of forcing our way

* We afterwards learned that this was a noted cattle hacienda, known as *Calabasa*, i. e., the pumpkin or gourd. Why so named, I know not, except from the quantity that grow wild in the valley near.

through the mountains, except with pack-mules. Mr. Pratt made some sketches of the wild and picturesque scenery around us. No game was seen to-day.

September 17th. Began to feel much anxiety for the return of Mr. Thurber and his party, as they took but a small supply of bread with them. I did not think it proper to move until they rejoined us; for in case they had not succeeded in procuring aid, they would be in a sad strait for food.

About ten o'clock they were discovered slowly wending their way among the hills, and were soon after among us. Their journey had been unsuccessful. They had traversed the country, as they estimated, some thirty miles west and north-west, till they struck a well-beaten wagon road; and had visited many deserted ranchos, and two depopulated towns, in both of which were churches. They had suffered much for want of food, having subsisted chiefly upon peaches, which they found in abundance in the orchards of the deserted towns, and upon the fruit of the prickly pear and yucca. In returning they followed the road some twenty miles in the opposite direction, but found not a living soul.

No time was now to be lost. Our provisions, even on half allowance, were fast diminishing; and the only alternative was to retrace our steps as fast as possible to our camp on the San Pedro. The wagon and pack-mules were at once got in readiness; and by noon we bade adieu to our "lost camp." Made about fifteen miles, and encamped in a fine oak grove, with wood, grass, and water.

September 18th. Got an early start; and instead

of following the roundabout way we had come, I determined to make a short cut across the prairie, which seemed quite open to the base of a conical hill, thereby saving eight or ten miles. Found the country undulating and quite smooth; and the grass, though green, was short, presenting no obstruction to the wagon. Small oaks appeared in every depression; with a few on the plain. At noon we struck the sources of a small stream running eastward, bounded by a broad and beautiful valley, into which we descended. This proved to be the *Rio Babocomori*, a tributary of the San Pedro. We followed it until three o'clock, when we encamped near the ruins of a large hacienda, which stood immediately on its banks.

I would have gone further, but Colonel Graham, with his party, instead of taking the shorter cut with us, had followed the trail which he took out, thus lengthening the distance considerably. As we were in a very good place, with water, wood, and grass, near at hand, I sent the arrieros across the hills, to intercept the Colonel when he came along, and direct him to our camp. At six o'clock he arrived.

When passing the stream to-day, we were startled by a singular cry from the top of a cotton-wood tree, which overhung our path. It was found to proceed from a young panther; when a well-directed shot by Mr. Cremony, brought the animal down. It proved to be not much larger than a cat, and of light brown, or tawny colour. Another incident, was the meeting with a herd of about a dozen wild horses. They gazed on us for some time, with heads and tails erect; they finally got our wind, when they bounded gracefully

over the prairie in a single file, led by a large black stud. Before we had our tents pitched, Mr. Pratt got out his fishing-tackle to see what the stream could furnish; and his industry was rewarded with a good mess of fish, which helped to eke out our scanty dinner.

September 19th. Deeming it advisable still to go to Santa Cruz, to deliver up our fair captive, as well as to procure some mules and provisions, in case those expected from the Copper Mines had not arrived, I sent two men off this morning before day-light with a note to Mr. Gray at the camp, on the San Pedro, which I judged to be from twenty to twenty-five miles distant. Informed him of our situation, and requested that he would send us four sheep, and some sugar, coffee and biscuit, from my private stores, all of which they could bring upon their mules.

Soon after breakfast two Mexican soldiers came in on the run, and presented me a letter. It was addressed "To any person connected with the Mexican or the American Boundary Commission," and proved to be from General Condé. The General stated that, after eight days wandering among the mountains and on the plains, he had reached Santa Cruz; and not having seen or heard of the Mexican or American Commission since he left the camp on the San Pedro, he had sent couriers to trace them out, inform them of his safe arrival, and guide them to Santa Cruz. He and his party, consisting of four of his officers, had left in advance of the main body, and failing to reach their place of destination, had slept in the mountains. Expecting to reach Santa Cruz before night, they had

supplied themselves with but two days' provisions and one blanket; and hence had suffered greatly for the want both of food and covering. The first day and night it had rained hard, as will be remembered. It seems that they crossed the Santa Rita mountains somewhere, and reached the deserted ranchos and towns where Mr. Thurber had been. Taking the California road,* they followed it southwardly, and first fell in with a settled place at Imuriz, a town about seventy-five miles south of Santa Cruz. They had subsisted meanwhile on peaches, which they found in the deserted villages and ranchos, and upon the bean of the mezquit.

These couriers had left Santa Cruz but the day before, and soon after they fell upon a trail which proved to be ours. They told us that we had been only some ten or twelve miles from that place; and that had Mr. Thurber pushed his search to the left of the mountain, instead of following the stream to the right, he would in three or four miles have struck a valley and trail leading to his place of destination. I now began to feel anxious on account of Dr. Webb and Mr. Salazar, but hoped they had joined the main body of the Mexican party, which I still believed had gone to *Tucson*.

* I have before stated that the California road goes through Santa Cruz. The direct road it appears passed the mountains three miles north of the town, thereby saving a detour of about ten miles. The emigrants however that traverse this road, generally visit the town; but as few had gone this way the present season, the turn off to Santa Cruz, which is at San Lazaro, had become almost obliterated, and General Condé overlooked it, keeping along the main road, which continues to Imuriz, and Santa Madelena.

I proposed to Colonel Graham to send one of his men to the San Pedro camp, advising Lieutenant Whipple and Mr. Gray of the information we had received; and in case any of the Mexican Commission had found its way back, to apprise them of General Condé's arrival in Santa Cruz, and direct them to our camp, where they would find the couriers and guides. As the Colonel required a supply of fresh meat to carry him back to the Copper Mines, I sent, at the same time, for eight sheep for him and his party. Colonel Graham accordingly dispatched one of his soldiers to the San Pedro camp.

A few fish were taken to-day; and fortunately we found near the old hacienda, a plentiful supply of purslain, so that with the little flour we had, we got along very well and without much complaint from the men. I felt quite ill myself from the exposure to the sun and insufficient food: and lay most of the day in the shade beneath the bushes which grew on the river's bank.

The valley of the Babocomori, is here from a quarter to half a mile in breadth, and covered with a luxuriant growth of grass. The stream, which is about twenty feet wide, and in some places two feet deep, winds through this valley, with willows, and large cotton-wood trees growing along its margin. Some of our men followed it about seven miles, to its junction with the San Pedro. This hacienda, as I afterwards learned, was one of the largest cattle establishments in the State of Sonora. The cattle roamed along the entire length of the valley; and at the time it was abandoned, there were not less than forty thousand head of them, besides a large number of horses and mules. The same cause

which led to the abandonment of so many other ranchos, haciendas, and villages, in the State, had been the ruin of this. The Apaches encroached upon them, drove off their animals and murdered the herdsmen; when the owners, to save the rest, drove them further into the interior, and left the place. Many of the cattle, however, remained and spread themselves over the hills and valleys near; from these, numerous herds have sprung, which now range along the entire length of the San Pedro, and its tributaries.

September 20th. The soldier, whom Colonel Graham had sent to the San Pedro camp yesterday afternoon, returned this morning, and reported that when he had got within a short distance of the camp, he discovered a party of thirty or forty Indians, and in order to avoid them, he had concealed himself in a ravine, where he had passed the night. From this place he had made his way back to our camp, without reaching Lieutenant Whipple. I questioned this man as to the certainty of the people whom he saw, being Indians. He said *they were a mile off*; but seeing feathers in their hair, the peculiarities of their dress, and their galloping with speed over the plain, he felt sure they were such. Colonel Graham manifested much uneasiness, and now proposed that we should all proceed to the camp on the San Pedro, return with Messrs. Whipple and Gray to the Copper Mines to refit, and take a new start; or that all should go to Santa Cruz for the same purpose. I did not believe the people seen were Indians; and as the engineering parties were but two or three days' journey from the point where they would begin their survey, I could see no advantage in retrac-

ing our steps to the Copper Mines. We had no time to lose ; and if our supplies were not sent us, I believed that we could get flour and such articles as were absolutely necessary at Santa Cruz, or some other place in Sonora, so as to enable us in a few days to proceed to the Gila. Mr. Cremony, who doubted the soldier's story, volunteered to go to the San Pedro camp with a single man, if I would permit him. On my accepting his services, he selected a trusty and courageous Mexican named Leonidas, and started at once on his errand.

Mr. Cremony had scarcely left, when Antonio and Carroll, the two men I had sent off early yesterday morning for the sheep, returned. They had followed the San Pedro to the mouth of the Babocomori, thinking we should move our camp that way ; and had fallen in with a party of thirty or forty Mexicans, who had a camp and a corral near the San Pedro, and were engaged in hunting wild cattle. They told the Mexicans who we were, and of our desire to get to Santa Cruz ; for when they left us, the couriers had not arrived from General Condé. They also informed them that we had with us a captive girl named Inez Gonzales, whom we were about restoring to her family. The Mexican party were all from Santa Cruz ; and, singularly enough, the father, uncle, and many of the friends of Inez, were among them ; in fact, there was scarcely one of the number to whom she was not known. This was the first intimation that they had received that the poor girl was living, and had been rescued from her savage captors. They required no urging, but to a man left their hunting ground, and accompanied Carroll to our camp.

The joy of the father and friends in again beholding the face of her whom they supposed was forever lost from them, was unbounded. Each in turn (rough and half naked as many of them were), embraced her after the Spanish custom; and it was long ere one could utter a word. Tears of joy burst from all; and the sun-burnt and brawny men, in whom the finer feelings of our nature are wrongly supposed not to exist, wept like children, as they looked with astonishment on the rescued girl. She was not less overcome than they; and it was long before she could utter the name of her mother, and ask if she and her little brothers yet lived. The members of the Commission who witnessed this affectionate and joyful scene, could not but participate in the feelings of the poor child and her friends; and the big tears as they rolled down their weather-beaten and bearded faces, showed how fully they sympathized with the feelings of our Mexican friends.

The captain or leader of the party was Don Ilarion Garcia, a gentleman of intelligence, from whom we obtained much interesting information about the country. He was a merchant and government contractor; had been in California; and was well acquainted with Colonel Fremont, and the pioneers of that State. He told us of mines in Sonora that produced ores of gold, silver, cinnabar, and copper, in several of which he possessed an interest.

After leaving our Mexican friends awhile to themselves, I returned to my tent, to learn the news. They all assured me that the restoration of a young female to her family, after being carried off by the Indians,

was an event unknown to them. Boys occasionally escape from their captors, and find their way again to their homes; but young women are generally forced to marry, and when they become mothers, they have no desire to return. It was gratifying to the fair captive to learn that her mother, brothers and sisters, were well; though her mother still pined for the loss of her daughter, under such painful circumstances.

Two of the party dined with me on the scanty fare I could offer them; after which they all returned to their camp, except the father and uncle of Inez, who remained to accompany us to Santa Cruz. Finding that we were short of provisions, they sent us a fine quarter of beef.

Mr. Cremony returned at nine o'clock in the evening, and reported that all were well at Lieut. Whipple's camp. Mr. Gray, with two or three others, had left several days before for Santa Cruz. We felt considerable anxiety on their account; for as they had not reached there when the couriers left, it was pretty certain, that, like the rest of us, they had missed their way.

September 21st. It rained all day, making it impossible to move. More of the hunting party on the San Pedro, visited our camp, to see the captive girl. The men who were unprovided with tents, and the cook, took up their quarters in the old hacienda, where they were sheltered from the rain.

September 22d. Set off once more for Santa Cruz, recrossing the stream, and passing around the north-western extremity of the Sierra. Our course was then due south to a range of hills, through the valleys of which we pursued our way among scattering live oaks,

which greatly impeded travel. There was a well-marked trail here, but no wagon road. We were often brought to a stand by the overhanging limbs of the trees, which it was necessary to cut away; and in spite of all our precautions, the wagon bows were broken. Met a party in a thicket engaged in drying beef, who invited us to help ourselves to as much meat as we wanted from a bull they had just killed; a permission of which we thankfully availed ourselves. At 5 o'clock, encamped among the hills in a thick wood, near a small rivulet.

September 23d. Resumed our march at 8 o'clock, our course still south, through a wood quite difficult for the wagons. A few miles brought us to the *puerta*, or gate in the mountain; passing which, we emerged into a very broad and open plain of remarkable beauty. From the elevation where we first saw this valley, the prospect was exceedingly picturesque. Around us grew the maguay, the yucca, and various kinds of cacti, together with small oaks; while beneath us, the valley spread out from six to eight miles in width, and some twelve or fifteen in length. Unlike the desolate and barren plains between the mountain ridges, which we had crossed between the Rio Grande and the San Pedro, this valley was covered with the most luxuriant herbage, and thickly studded with live oaks; not like a forest, but rather resembling a cultivated park. While the train was passing down the mountain, I stopped with Mr. Pratt to enjoy the scene, which he hastily transferred to his sketch-book. Opposite from where we stood, and not more than five miles distant, were the mountain and gorge, where we had been encamped.

for five days, endeavoring to find a passage through. At the further end of the valley into which we were descending, lay Santa Cruz. — I now saw that if I had continued my course due south, as I first intended on leaving the San Pedro camp, I should have struck this valley the second day; but by following the trail of the Mexican Commission, I was led about eight miles too far west. This brought us on the opposite side of the Sierra, and led us into the gorge from which there was no egress. In passing down the valley, we met Mr. Salazar and Mr. Henry C. Force, with a small party from Santa Cruz bound for the camp on the San Pedro, and the Gila. They informed us of the safe arrival at Santa Cruz of the Mexican Commission, Dr. Webb and Mr. Gray.

Before setting out this morning, two men started in advance to advise the mother of Inez of our approach, and when within two miles of the town, we saw a small party approaching, partly on mules and partly on foot, among whom were the fair captive's mother, brothers, and uncle. As we drew nearer, Mr. Cremony helped Inez from the saddle, when in perfect ecstasy she rushed to her mother's arms. Words cannot express the joy manifested on this happy occasion. Their screams were painful to hear. The mother could scarcely believe what she saw; and after every embrace and gush of tears, she withdrew her arms to gaze on the face of her child. I have witnessed many scenes on the stage, of the meeting of friends after a long separation, and have read highly-wrought narratives of similar interviews, but none of them approached

VALLEY LEADING TO SANTA CRUZ SONORA

in pathos the spontaneous burst of feeling exhibited by the mother and daughter on this occasion. Thanks to the Almighty rose above all other sounds, while they remained clasped in each other's arms, for the deliverance from captivity, and the restoration of the beloved daughter to her home and friends. Although a joyful scene, it was a painfully affecting one to the spectators, not one of whom, could restrain his tears. After several minutes of silence, the fond parent embraced me, and the other gentlemen of the party, in succession, as we were pointed out by her daughter: a ceremony which was followed by her uncle, and the others, who had by this time joined us. We then remounted our animals and proceeded towards the town in silence; and it was long before either party could compose themselves sufficiently to speak.

As we journeyed on, we met other villagers coming out to meet us, and among them two little boys from eight to twelve years of age. They were the brothers of Inez; and when they saw their sister, they sprung upon the saddle with her, clasping their little arms around her, and like their mother, bursting into tears. Releasing their embrace, Inez pointed to us, when the little fellows ran up to our horses and eagerly grasped our hands, trotting along by our sides, while the tears rolled down their cheeks. A little further, we were met by another lad about twelve years of age. He too, embraced the returning captive, and like the others, burst into tears. But those tears were excited by feelings very different from those awakened in the other boys, the brothers of Inez. They were tears of des-

pair—of long cherished hope checked in the bud;—of disappointment—of pain—of misery! This poor boy was the child of the woman who was made a captive by the Apaches, at the same time with Inez. She and Inez had left their homes together, one year ago this very day, for the fair of Madelena, where their party was when attacked by the Apaches, and all but three killed or taken prisoners. Of the three who were made captives, no news had ever been heard; and the poor girl now returning, was the first intelligence that either was in existence. The little orphan wrung his hands with despair as he raised his eyes first to the companion of his mother, and then to us, thinking perhaps that we might have regained his parent, as well as her. I was much affected when Inez told me who this lad was, and resolved that I would make an effort for her restoration too, as soon as I could communicate the particulars to the government, as she is the person who was bought by the New-Mexican traders, and taken to Santa Fé, a short time before the purchase of Inez.

As we drew near the town, numbers of the inhabitants came out to meet us, and welcome back the restored captive. When about half a mile distant, Inez wished to dismount and walk thence to the church, that she might first offer up her prayers for her deliverance from captivity, before going to her home. Accordingly we all dismounted and accompanied her to the door of the church; and there she was met by many more of her friends, when they all passed forward and knelt down before the altar. We left them engaged in prayer, and waited outside the church until their devotions were concluded. They then passed

out, and escorted Inez, her parents, brothers and sister, to their home.*

We pitched our tents just beyond the walls of the town, preferring them to the adobe houses which General Condé had kindly placed at my disposition.

* I have spoken of the father of Inez Gonzales. He was in fact, her step-father, and named Jesus Ortis. He seemed ardently attached to her, and told me he loved her as his own.

CHAPTER XVIII.

SANTA CRUZ TO LA MAGDALENA.

Account of the missing parties—Description of Santa Cruz, and its population—Departure of Colonel Graham—Set out for La Magdalena—Increase of party—San Lazero—Cocospera—Its beautiful Valley—The cañon where Inez Gonzales was taken—First sight of the *Cereus Giganteus*—Babasaqui—Wild cattle—Imuris—Terrenati—San Ignacio—Its church—Abundance of Pomegranates—Passports demanded—Proceed to Magdalena—Summoned before the Alcalde—Legend of the origin of the town—Festival of San Francisco—Religious Devotees—Offerings to the Saint—Consecration of ribbons—Booths—Gambling—Perpetual fandango—Vegetable productions near the town—Fine scenery—Grand torchlight procession—Close of the Festivities—Description of La Magdalena.

September 24th. General Condé informed me that he had engaged for me fifteen hundred pounds of flour, but that no other provisions could be obtained, so great was the dearth caused by the frequent incursions of the Apaches. I called on Captain Barragan, the Commanding officer, to procure a portion of this flour at once, to send to Lieut. Whipple and the party on the San Pedro. There was a small grist-mill here under the charge of the Commandante; but there was no stock of flour on hand, and he was then grinding some for the Mexican Commission. Consequently he could only spare me a small quantity for the parties in

Santa Cruz, but promised that he would let me have some the following day.

Some account of the several missing parties may not be improper in this place. The Mexican Commission, on whose trail I depended, and which led me out of my proper course, followed an Indian trail the second day after leaving the San Pedro, which led them to the town of *Tucson*, a military post ninety miles from the Gila and about one hundred from Santa Cruz. They met with great difficulties in crossing the Santa Rita mountains, and were compelled to abandon their wagon. From there they took the road to Santa Cruz, which they reached in five days. Doctor Webb and Mr. Salazar, who proceeded in advance the day after we left the San Pedro, overtook the main body of the Mexican Commission, as we had supposed, and continued with it. Mr. Gray, in his attempt to reach Santa Cruz, followed the same trail, and also brought up at Tucson, from which he took a new start and arrived at the former place.

Santa Cruz is one of the nine *presidios* or military posts on the frontier of the State of Sonora, the others being Tucson, Fronteras, Babispe, Bacuachi, Tubac, Altar, San Carlos, and Hermosillo. It was formerly a place of considerable importance, with about fifteen hundred inhabitants; but at present its population does not exceed three hundred. It possesses a fine valley and bottom land of the richest soil, and is irrigated by a small stream bearing its own name, which has its rise in springs about ten miles to the north, in the beautiful valley through which we entered the place. It is admirably adapted for the raising of

cattle and horses, as well as for all kinds of grain. Wheat, in particular, does remarkably well here. The *Chili colorado* (red pepper), of which such quantities are consumed in Mexico, grows here in perfection, and is said to be preferred on account of its superior piquancy to any raised in Sonora. The climate is milder than in either the southern or northern parts of the State. In the winter it is subject to severe

Santa Cruz, Sonora.

frosts, so that the river freezes and snow often lies on the ground for several days. It is, however, a very sickly place, the inhabitants suffering from bilious fevers, in consequence of the proximity of a large marsh three miles west of the town. Many were ill at the time of my visit, and I was desirous to get away as soon as possible.

This place has suffered more than any other on the frontier from the inroads of the Apaches, it being on the principal route of communication with the interior from the north, as well as with the settlements of the civilized Indians. The place had become much reduced and impoverished by the frequent incursions of the Apaches, which prevented the inhabitants from cultivating the soil, except in the immediate vicinity of the town. If they suffered their cattle to stray two miles off, a band of skulking savages would emerge from some thicket where they lay in ambush, and drive them off. If but two or three men were tending them, they were either murdered or compelled to seek safety in flight. In such a miserable state of existence were these people, that they could scarcely venture beyond the walls of their town, except in parties of six or eight, who must then be well armed; and if they wanted to go any considerable distance, it was necessary to form large parties for mutual protection. It was in September, 1850, when the party with Inez were cut off about twenty miles from Santa Cruz, which led to the complete abandonment of the place. A few months, however, before our arrival, a brigade was raised by General Carrasco, for the protection of the frontier. The presidios were then strengthened; and Fronteras, Santa Cruz, and others, which had been abandoned, were again occupied by their poor and wretched inhabitants.

I was detained here until the 29th, waiting for the flour and *pinole* for the Gila parties. A portion had been procured and sent forward several days before, and Mr. Gray remained behind for the remainder. But

two mules could be obtained here, for which I paid seventy-five dollars each. I also procured some flour for Colonel Graham. On the 28th, he took his departure for the Copper Mines, where his engineers and the party for the survey of the Rio Grande, were still awaiting his return.

During our stay here, Dr. Webb was engaged three quarters of his time in attending the sick ; for in addition to the many that were suffering with fever, there were cases of a more complicated nature, which required the performance of surgical operations. For his services he made no charge. One would suppose that after attentions of this kind, and the restoration of one of their number from captivity, some little gratitude would have been shown us by the people of this place ; instead of which, however, depredations were nightly committed in our camp. Meat was stolen from the pot in which it was cooking ; blankets were taken from the men while asleep ; and all the ropes and iron stake-pins that secured our animals were carried off. These last were a serious loss to us, and could not be replaced. We were finally compelled to keep the people away from our camp ; and I felt it my duty to complain to the Cura of the pilfering propensities of his flock. He was fully aware of their thievish disposition, but was unable to restrain them. Many wanted to be employed as arrieros ; but after the examples we had of their dishonesty, I thought it prudent to have as little to do with them as possible. I engaged, however, Jesus Ortis, the father-in-law of Inez, to be our guide to Magdalena, and further if necessary.

September 29th. Being unable to procure any thing

at Santa Cruz but flour, I determined to go to Magdalena, a town seventy-five miles further south, where I was told I could find mules, and such articles of provisions as I required. The annual fair of San Francisco was to take place in a few days; and there, it was believed, would be a supply of every thing, particularly mules, of which I was most in need. I believed I could get back in ten days, and immediately after join the parties on the Gila.

When we came to get the mules in, we found that one was missing. I suspected that some of our dishonest friends had concealed it until after we should leave, and requested Captain Barragan to secure it, if it should be seen.

My journey to Magdalena was taken advantage of by many of the people of Santa Cruz, who wished to go to the fair; so that when my party was ready to move, I found it increased by fifteen men and two women, all mounted on horses, or mules, like ourselves, making altogether a cavalcade of thirty-one persons, besides our pack-mules. The Mexicans were all clad in their holiday dresses, and presented quite a picturesque appearance. The men wore chiefly roundabout jackets, with pantaloons open at the sides, showing their large white cotton drawers beneath. Some of their pantaloons were lined with pink or sky-blue; and in every case they were decorated with a row of bell-buttons, or clasps, extending from the hip to the ankle. Suspenders they never wear, a red silk sash being generally used to keep the pantaloons in their place. Every man also carries with him a *serape*, or blanket, which in the cool of the morning and evening is thrown

gracefully over his shoulders, and at night is used to cover his body. During the heat of the day, it is folded up and laid across his saddle, or fastened on behind. The women always wear the *reboso*, a scarf which covers the head and neck. In other respects, there is nothing peculiar in their dress, except that they prefer very gaudy colors.

Our road was said to be infested with Apaches, who were wont to conceal themselves in a cañon some ten miles in length, where they attacked small parties. Every man, therefore, took the precaution to be well armed. We did not get away until three o'clock in the afternoon, when a ride of six miles to the south-west brought us to *San Lazaro*, a large ruined hacienda, on the banks of the Santa Cruz River, where an extensive soap manufactory was formerly carried on. The buildings were beautifully situated in the valley, amid a grove of large cotton-woods, with an extensive orchard of peach and quince trees; but the fruit had all been gathered by parties who had passed before us, or by the Indians. I walked through the tenantless chambers of the hacienda, which seemed to have been built with a view to comfort and convenience unusual in the country. It had been deserted for six years; and in this short period, the rain had washed away some of its walls, and portions of the roof had fallen in. An adobe building will last many years with care; but it must be closely watched during the rainy season: for when once the water has found its way through a wall, it very soon makes for itself a wider passage; next the timber in the roof gives way; and in a short time, the whole building becomes

a ruin. The stream here takes a short turn towards the north, passing through Tubac and Tucson; soon after which it loses itself in the desert, without reaching the Gila. Since leaving Santa Cruz, our course had been along the banks of this stream, in many places thickly overgrown with willows and cotton-woods, and hemmed in on both sides with mountains. Many deserted and ruined ranchos were seen in the valley, for it had not a single inhabitant beyond the walls of Santa Cruz. Rode about six miles further south and encamped.

September 30th. Eight miles from camp, brought us to *Cocospera*,* an old mission at the head of the San Miguel River, which was abandoned about six years before in consequence of the inroads of the Apaches. Here, rising from a spur of the plateau, and overlooking the valley, stands a church, a building which presents quite an imposing appearance, with its towers and dome still in a good state of preservation. It is surrounded by houses or stalls with fronts open towards the church, which were probably occupied by those who came from a distance to worship; or they may have been intended for the Indians, many of whom were formerly connected with all these frontier missions, and employed as laborers upon the lands belonging to them. The interior of this church must have been very beautiful in its time, when its numerous niches were filled with statues, and its walls covered with paintings. The gilded and painted ornaments

* This place has since become somewhat notorious from its having been colonized anew by the party of Frenchmen from California, who subsequently attempted to set up a government of their own, and for a while gave the authorities much trouble.

upon the walls and ceiling still remained, consisting of crucifixes, doves, and other sacred emblems, surrounded by inscriptions, scrolls, and flowers, which displayed more taste than we had before seen in such buildings. Several wooden figures still stood about the altar; but the pictures were all gone. Bats were already in full possession of the edifice, and hung from the projecting walls and corners, like so many black ornaments; while the swallows which were flitting about us had also taken up their abode here, and added their mud-built nests to its interior decorations. This was one of the richest missions in Sonora; and its property in cattle was so extensive, that (as we were afterwards told) the increase of a single year amounted to ten thousand head. In the valley below and immediately adjoining the building, stood the orchard; well stocked with apples, pomegranates, peaches, and quinces. These last we found in the greatest profusion, the trees still bending with their loads of fruit. There are two varieties of the quince here, one hard and tart like our own, the other sweet and eatable in its raw state, yet preserving the rich flavor of the former. The Mexicans gathered and ate them like apples; but I found them still too hard for my digestive organs. We gathered a few, which we afterwards stewed; they were then very palatable, and in a measure supplied the place of vegetables. The valley here is more than half a mile wide, and seems once to have been well cultivated.

Proceeding down the valley, we noticed many ruined ranchos, corrals, and other remains of a civilized community, now overgrown with tall grass and

shrubbery. Cotton-wood trees and sycamores of a large size grew along the margin of the stream, and at intervals were found in groups. The grass every where was rich and abundant. It was really sad to see so beautiful a region reverting to the condition of a wilderness in consequence of the attacks of ruthless marauders. We now approached the dreaded cañon, where our fair captive, Inez Gonzales, had been taken and her companions murdered, one year and seven days before. Our Mexican companions had been talking of it all the morning; and as we drew nearer and were about to enter the defile, they huddled more closely together, each fearful of taking the lead, or of being ten feet from the rest. They were going to the same fair as before; and it was believed that the Apaches, knowing of the large numbers that annually collected at Magdalena, were on the watch for their victims in all the mountain passes, where they could lie in ambush and throw their lances or arrows at the passing traveller. We soon came to a spot where, in a dense thicket of forest and shrubbery, our attention was directed to a rude cross. Here was the fatal spot where, on the occasion above referred to, the savages rushed from their ambuscade, shooting several of the Mexicans with their muskets, and piercing others with their long lances, before they could recover themselves and act on the defensive. Within twenty feet of the path ran the stream, whose mysterious murmuring beneath the dense foliage seemed a fit appendage to such a deed of blood. The mountains here on either side of the defile approached within a hundred feet of the path; though in some places they are much nearer, and rise

from five to eight hundred feet, either abruptly or with steep-sloping banks.

We saw here, for the first time, the giant *Cereus* (*Cereus giganteus*), or *petahaya*, of the Mexicans. This monster of the cactus family assumes various forms; sometimes rising in a single fluted column to the height of thirty or forty feet; sometimes, at eight or ten feet from the ground, it divides into two or more branches, which turn upwards like the prongs of an inverted fork; others again throw off four or more arms, disposed with great symmetry, and having the appearance of gigantic candelabra. These covered the rocks on both sides for miles; and among them grew numerous humbler species of the same family, some loaded with rich red fruit, and others trailing their snaky branches over the ground, altogether forming a striking and peculiar vegetation, unlike any thing we had before seen.

After winding our way about ten miles through this defile, we again emerged into a plain or broad valley, through which still coursed the beautiful little stream which we first met at Cocospera; though by what name to call it, I hardly know. Like many of the largest streams which wind among the mountains and across the plains of Mexico, this bears several names, according to the towns which stand upon its bank. Cocospera, Imuriz, San Ignacio, and San Miguel, have been applied to it in turn; and I cannot find, from the maps which I have consulted, that it bears any general name. It forms the western branch of the Sonora River, one of the principal streams in the State.

When we again found ourselves in the open coun-

try and beyond the dreaded cañon, our Mexican friends showed themselves less desirous of keeping as close to us as they had done. Soon after they told us they wished to reach Imuriz before night, when we took leave of them; and having already come thirty miles, we thought best to stop near the little town of *Babasaqui*. Our general course during the day had been south south-west. We passed many deserted ranchos with fine orchards near them; but not a living being had been seen until we reached this settlement. In the orchards we found more fruit than we had seen before—from the fact, probably, that there were but few travellers this way, and people did not dare venture so far from their homes for the luxury. We gathered a supply of delicious peaches, with which we filled our haversacks and pockets. Many wild cattle were seen to-day, some of which crossed our path quite near us. A bull gave chase to Mr. Thurber, and pursued him until he regained our camp.

After the tents were pitched, we strolled up to the village, where we found an uncle of Inez. He had not before heard of the restoration of his niece, and expressed a thousand thanks to us all. In the evening, he, with several others, came to our camp, bringing milk, cheese, tortillas, and peaches, which they begged us to accept. It was all they had to give except their thanks, and they seemed much pleased at our accepting them. The people here seemed very quiet and well disposed, with well cultivated fields, which showed that they devoted a portion of their time, at least, to labor. A man living here who had a contract to furnish the government with five hundred head of cattle, told

us that so abundant were they in this valley and the adjacent plains, that he had not yet begun to collect them, although all were to be delivered on the 10th of October. His mode of catching them was that before alluded to, viz., to lasso them by the head or horns, then fasten them to the heads of domesticated cattle, and drive them to a corral or pen. During the night, we heard the bellowing of the wild bulls quite near us, and felt some apprehension that they might make a charge upon us, and stampede our mules, if they did no other mischief.

October 1st. A south-easterly course of three miles brought us to *Imuriz*, a miserable looking village. There was an improvement which I noticed in the adobe houses here; they were all capped with brick or tiles, which gave them an air of finish and durability above those that are simply capped with mud. Here we rounded a mountain, and then followed a valley in the same direction. Every thing now around us indicated an approach to a civilized, or rather, I should say, a settled country. Ranchos with cultivated grounds, fields of wheat and corn, orchards teeming with peaches and pomegranates, met us with every expansion of the valley. The contracted foot-path, or mule trail, however, still showed that we had not yet reached the country of wheeled vehicles, all the transportation being carried on by means of pack-mules. We met many people to-day passing from one village or rancho to another; and not a little curiosity was manifested at seeing such a group of white faces with long beards wending our way among them.

Riding up to the church, which appeared quite new, we dismounted and hitched our animals, to take

a brief inspection of it. Like the other buildings of the country, it was constructed of adobe, but had neither steeple nor tower. Three bells were suspended from a frame in front, on one of which, I noticed the date 1680. There was nothing of interest here; so we journeyed on to *Terrenati*, a village of three or four hundred souls, two miles distant. Continuing our ride six or eight miles further still, and following the same stream that we first met at *Cocopera*, we reached *San Ignacio*. We rode into the plaza facing the church, and, dismounting, applied at an adjoining house for admission into the sacred edifice.

Door-way of the Church, San Ignacio.

We were received with much politeness, and conducted by a young woman through an entrance near the altar into the church, which did not meet my expectations, as it was by no means in keeping with the exterior of the building. There were but few pictures

on the walls; and the statues, which are of wood, and from two to four feet high, were quite ordinary. Among the latter, I noticed two Chinese figures, intended doubtless for mandarins, but here metamorphosed into saints. These images reminded me at once of our proximity to the Pacific, with its opposite shore formed by the Celestial Empire, between which and Mexico, there was formerly a flourishing commerce. I asked the attendant if those figures were not from China; to which I received the usual and unsatisfactory reply of "*Quien sabe?*" I suppose she knew as little of China as of the topography of the moon; and as to the personages they originally represented, it was a matter of perfect indifference to her and the people who worshipped there. The church is built entirely of brick, being the first edifice of that material we had seen. It has two towers, and is on the whole a picturesque looking structure. This was one of the earliest missions established in Sonora, and was founded about the year 1687. Though the mission has been abandoned for many years, the results of Jesuit industry are still apparent in the shape of some pomegranate orchards.

We had heard much of the superiority of the pomegranates of this place, for they are famed in all the region round about; and for once in this country we met with something that really came up to our expectations. They were delicious beyond comparison. Some specimens measured sixteen inches in circumference, and they were sold at from one to two dozen the real (twelve and a half cents). Immediately over the wall where we stood, was a large orchard with long

lines of these trees bending under their luscious burden ; the deep brilliant green of their foliage presenting a striking contrast with the bright yellow of the fruit. Great quantities are used in the distillation of a strong and fiery species of aguardiente. The man through whose house we entered the church was quite polite to us, and invited us to drink of this liquor, and to help ourselves from heaps of the fruit and of peaches likewise.

The place is quite neat for a Mexican town, and we left it with a very favorable impression, which however was somewhat weakened ere long. After we had proceeded a mile upon the road, I received an invitation from the Alcalde to return. Expecting some civilities from the head man of the place, I somewhat reluctantly obeyed ; for I was desirous to reach Magdalena before nightfall, and would willingly have dispensed with these hospitalities. I found, however, that his object was to ascertain who we were, and to see our passports. I informed him who I was, and added that by virtue of my office, I claimed a right to go any where in pursuance of objects connected with my duties. The gentlemen with me, I told him, were attached to the Commission ; and if he desired to be satisfied of the truth of my statement, he must send to Magdalena, whither we were going ; as my papers were now with my baggage on the pack-mules several miles in advance. The little, fat, puffy official, was not at all satisfied ; he seemed to distrust my statement, and wished us to go before the Prefect, to which I decidedly objected. I again politely told him that I should be in Magdalena a couple of days, and would there

satisfy his doubts. Continuing our journey, a ride of six miles through a richly cultivated valley brought us to *La Magdalena*, or rather within half a mile of it, where we encamped. I did not wish to go nearer the town, on account of the large number of people that would be assembled there.

October 2d. Before I was out of my bed, (and I rose before the sun,) a messenger came to my tent and asked for the "Commandante." I heard him making inquiry of the cook, and, springing from my cot, went to the tent-door and asked his business. He said the Alcalde desired to see me as soon as possible. I told him I did not make calls at that hour, but would see him after breakfast. Accordingly, about nine o'clock, I waited upon that dignitary, accompanied by Dr. Webb, Mr. Cremony, and Mr. Thurber. He proved to be a shop-keeper of the third class, occupying a filthy little place, with a stock in trade, I should think, worth some twenty-five dollars. I told him that agreeably to his orders I had called upon him, and desired to know his commands. He presented me a letter which he had just received from the Prefect of San Ignacio. It stated that a party of Americans had passed through that place, who, on being called upon to show their passports, had said they would do so at *La Magdalena*. That he wished us to be examined and detained until he came, which would be to-day. Mr. Cremony then introduced me as the Commissioner of the United States, explaining my duties and those of the gentlemen attached to my party. I first stated to him briefly the object of my visit to *La Magdalena*, viz., to purchase provisions and mules for our surveying

parties at the Gila ; and then showed him my commission, with the great seal of the United States and the bold signature of Zachary Taylor affixed to it, together with letters from General Condé and Carrasco, requesting the civil and military authorities to extend to me every aid in their power. Whether it was the name of the hero of Buena Vista or the number and character of my letters that produced the effect, I do not know ; but he expressed himself perfectly satisfied before I had got half through, and said that he was only acting by order of the Prefect of San Ignacio. I told him that the Prefect had not treated us well ; that I had stopped in the public square with my party, and had been for more than an hour in the church, or in the dwelling house of one of the citizens, when a hundred of the people were around us, and knew our history ; that instead of asking me then, he had permitted me to resume my journey, and after getting a mile from the town, had ordered us back. After many apologies, the Alcalde told us to go where we pleased, and very politely tendered his services.

I did not really blame the authorities alluded to except for compelling us to retrace our steps. The quiet people here have been so much annoyed by the conduct of California emigrants who have passed through the country, as to make them shy of all Americans. These reckless adventurers often set at defiance all law and propriety, and we had many accounts of their shameful and brutal conduct. The fields in this country are seldom fenced, and it is no uncommon thing for a party of these men to encamp and turn their animals into a field of corn, on which the help-

less *ranchero* and his family are probably depending for their chief support. They will enter a house, pistol in hand, demanding whatever it affords; frequently they help themselves, without the ceremony of paying for what they take; and commit other outrages which make one who has any national pride blush to hear recited.

This affair being ended, we walked around the plaza, or public square, where crowds of people were busily occupied in setting up their booths for the approaching *fiesta* of San Francisco. These were chiefly constructed with boughs of trees lashed together, and covered with the same. A few had begun to display their wares. We next went into the church.

Although San Franciscos are as common in Mexico, as Washingtons, Jeffersons, and Franklins are with us, and churches dedicated to that saint are to be found all over the country; yet this of La Magdalena is the most celebrated and potent of all, inasmuch as it contains a celebrated figure of San Francisco, which, among other miracles, performed that of selecting the place of its abode. A party of San Franciscans, as the legend goes, were travelling in search of a proper spot to found an establishment, and had among their other effects this sainted figure packed upon a mule. On arriving at this place, the animal carrying the precious burden became obstinate, and refused to budge. This the worthy fathers interpreted as indicating the Saint's pleasure to stop here. So here they built the church. The original building, with the exception of the tower, is in ruins; but a new one has been erected within a

few years, which is quite an imposing edifice, with two fine towers and a large dome, beneath which the Saint reposes.

For several days previous to the 4th of October, which is the Saint's day, preparations for its celebration begin; so that the devotions and offerings, with their accompanying festivities, are in full blast a day or two in advance. La Magdalena and the Church of San Francisco are the Mecca of devout Mexican Catholics. From the borders of Sinaloa on the south to the furthest outpost near the Gila, and from the Gulf of California to the Sierra Madre, they flock in by thousands, to offer their devotions at this shrine. It is not unusual for very great sinners to bring their burden of guilt a distance of four or five hundred miles; a journey in this country of greater difficulty, and requiring more time, than one from New Orleans to Quebec. The poorer classes often come a hundred miles on foot, begging by the way. The more penitent, like the idolaters before the temple of Juggernaut, or the devout Mohammedan at the shrine of his prophet, prostrate themselves, and, with their hands crossed on their breasts, advance on their knees a hundred feet or more to the church. Both men and women are thus seen toiling over the dusty street and brick pavement of the church to the presence of the Saint, who is laid out beneath the dome and in front of the altar. When the votaries reach the bier, they cross themselves, and with outstretched arms repeat their prayers. They then rise to their feet, and, drawing nearer, present their offerings.

The body of San Francisco, or rather its image, lies

upon a platform or bier clothed in rich vestments, and covered with a piece of satin damask of the most gorgeous colors. The head, hands, and feet are alone exposed. These are made of wood, colored to represent flesh; and I was informed by a Mexican gentleman, that these constituted the whole statue. The body, he told me, was merely a frame-work, stuffed with rags and cloths to give it a form, over which the drapery was disposed. The offerings consist of money and candles; and as wax is quite expensive here, the poorer class present candles of tallow. There was a continual jingling of money; in fact, so constant was the dropping of silver dollars into the receptacle placed for them, that no other sound was heard. What was singular in all this mummary was, that no priest was present. The men who took the money were ordinarily dressed, having on nothing to distinguish them from the crowd around. There may have been a priest behind the altar or somewhere not visible to the devotees; but while I stood by the side of the image, and witnessed the proceedings on two occasions, I could perceive none. An estimate may be formed of the crowds here present, when I state that the receipts this year, although the attendance was less than usual, were about twelve thousand dollars; while on some former occasions, the amount of money voluntarily given had reached the sum of eighteen thousand. To the question what become of all this money, I received the usual reply of "*Quien sabe?*" A gentleman, however, told me that it went to the city of Mexico, and that neither the poor of Magdalena nor the church there derived any benefit from it.

In the evening I visited the church again, when I witnessed the ceremony of consecrating ribbons. The space around the image was crowded as in the morning with devotees, each provided with a piece of ribbon. The mode of consecrating it depended upon the ailment of the applicant. If he or she had a pain in the head, the ribbon was passed several times across the forehead of the figure by the officiating Franciscans. If blind, the ribbon was passed across the eyes; if lame, or afflicted with rheumatism, it was passed over the arms or legs; and in many instances I saw it drawn between the toes of the Saint. Had some of our turtle-fed aldermen been the applicants for the latter process, one might have believed it to be for the gout; but I fancy that a diet of frijoles and tortillas does not often engender that disease in Mexico. Some of the worshippers were provided with long pieces of ribbon, which they applied in turn to every part, a knot being tied after each application, making, probably, as one of the gentlemen observed, "a sort of family medicine chest." The faith of the people in this thing of wood and paint is astonishing. An old man told us with the utmost seriousness, that last May, when the cholera visited the place, and was cutting off twenty a day, they had only to bring the image into the street, and the disease at once disappeared. He was asked what he would have thought if the disease continued. He replied, "That it was the will of the Saint, and we must submit."

In our rambles, we dropped into an attractive-looking shop to make inquiries about such provisions as we required. The proprietor, Señor Gonzales, was

a native Castilian, which we soon perceived by the purity of his language. He at once recognized us as Americans; and after answering our inquiries, invited us into an inner apartment, furnished very handsomely, and in good taste. One of the first things I noticed here was an American rocking chair—an article of luxury better adapted, one would suppose, to the quiet habits of the Mexicans, with their fondness for a siesta during the heat of the day, than to those of restless Yankees. Wine and other refreshments were offered us; and an hour was agreeably spent in conversation with our new acquaintance. He gave us much information about the country, and the ceremonies we had just witnessed. While there, several strangers, also gentlemen of education and respectability, came in; and finding who we were, and of what we were in pursuit, they gave us such information as we required, and tendered us their services. I regretted to learn that we could not procure the provisions we needed; but it was expected that the fair would bring many mules into market, so that in a few days we could obtain all that we wanted.

In the evening we walked about the town, and among the booths, which were arranged on every side of the plaza, and along the principal streets. They seemed much like those which it was customary to erect in New-York on the Fourth of July. Cakes of various kinds, tortillas, fruits, and aguardiente, were the staple articles; but while there were booths entirely appropriated to the sale of this intoxicating liquor, I do not remember to have seen a single drunken man. In the midst of these booths was a large

inclosure, covered with the boughs of trees, beneath which some hundreds were assembled, and engaged in dancing. An enormous bass drum, which was heard above all other sounds, a couple of violins, and a clarionet, ground out waltzes and polkas, while the beaux were swinging round the señoritas in a manner that would astonish our dancing community. Notwithstanding the crowd here assembled, most of whom were strangers to each other, the most perfect order was kept. The Mexican people are ardently devoted to dancing; and when they once enter into it, they do not cease until the sun appears the following day. Some of our party who were given to this amusement thought they would like to take a few turns. So, casting a glance along the line of dark-eyed damsels who occupied the benches, and selecting the most attractive, they advanced without any introduction, led them into the arena, and at once joined in the merry whirl. A perpetual fandango was thus kept up day and night; where people of all sorts, sizes, and conditions might be seen twirling to the slow measure of the Spanish reel, or the more active waltz and polka. But gambling, after all, seemed to predominate. Whole ranges of booths were devoted to this exciting amusement; and crowds of every age, sex, and class were assembled about them. Boys and girls of six and eight years of age laid down their coppers, and men their reals and dollars; while at other tables the more wealthy and aristocratic ventured their ounces. Some of the tables were attended by women, selected, not on account of their personal beauty, but for their expertness in shuffling the cards.

October 3d. Accompanied Mr. Pratt to the hills opposite our camp, to take some sketches. The hills were separated from the camp by the river, on the banks of which were some hundreds of men and women bathing or washing. A few cotton-wood trees grew along the valley; and the margin of the stream was lined with willow-bushes. The hills here are about five hundred feet high; and from them we had a fine view of the town and adjacent plain, which was inclosed towards the south by a high range of mountains. The hill where we stood was literally covered with cacti of every variety that we had seen, from tiny plants not longer than one's thumb, just projecting from some crevice, to the giant cereus, that shot up to the height of fifty feet. The agave, yucca, fouquiera, Spanish bayonet, mezquit, and other plants, alike grew in profusion around us.

In the evening we again visited the church, where the same scenes were going on as before described. It was now brilliantly illuminated, and a procession was marching through the crowd, each individual in it holding a lighted candle in his hand. The music was performed by a circus band, from Hermosillo, which played the same pieces for the interludes of the service as it did for the performances of evening. Some of our popular Ethiopian melodies occasionally greeted the ear.

October 4th. Finding it impossible to obtain provisions here, I determined to go to Ures, the Capital of the State of Sonora, about ninety miles distant, for the purpose of procuring what we needed, and of negotiating my drafts on the government, which I could

MAGDALENA, SONORA.—p 403. vol. i.

not do here. Señor Gonzales agreed to furnish the mules I wanted, but could not do so under a week or ten days. I accordingly gave him an order to procure for me ten pack and four riding mules, sundry pack-saddles, etc., which were to be delivered me on my return from Ures.

In the afternoon, services were performed over the figure of San Francisco, preparatory to its being carried through the streets in grand procession. As soon as the sun had set, the eight bells commenced a merry peal, the church was illuminated, and the procession formed. The figure was brought forth on a platform, or bier, over which was a canopy of crimson satin; and two lines were formed extending across the plaza, each individual bearing a lighted wax-candle in his hand. I estimated the number in the procession carrying these candles at twelve hundred. A band of music led the way, followed by boys and men swinging censers of incense. Next came the Saint immediately preceded by a priest; and a crowd of women carrying lighted candles followed, constituting the main body of the procession. Innumerable small rockets were thrown up by the populace, which flew about in all directions, and fell among the crowd. Muskets too were fired by such as had them from the streets and the house-tops, as the procession passed along. On the whole, the noise and confusion reminded us of the celebration of the 4th of July, and seemed to exhibit quite as little devotional feeling as that day brings forth among us. It was one continual scene of amusement and hilarity from the beginning to the end. After marching across the plaza and through

one of the streets, the whole distance not exceeding a quarter of a mile, the image was carried back to the church and laid on the shelf until the next year ; and so the grand fiesta ended.

We dined to-day with our Castilian friend, Señor Gonzales ; and at his house we met several Mexican gentlemen, among them Don Ilarion Garcia, whom we saw at our camp on the San Pedro.

La Magdalena is the best built town we had yet seen ; the houses are chiefly of adobe, though some are of brick, and nearly all are stuccoed and white-washed. Many are colored yellow and otherwise ornamented, in a manner exhibiting considerable taste. The permanent population does not exceed fifteen hundred souls, which number, during the days of the festival of San Francisco, is swelled to ten or twelve thousand.

CHAPTER XIX.

ILLNESS AND DETENTION AT URES.

Leave La Magdalena—Taken ill—Diary breaks of—Sufferings on the road—Reach Ures—Poor quarters—Dr. Webb and rest of party visit Guaymas—Kindness of Dr. Campbell—Description of Ures, the capital of Sonora—Theatricals—The Yaqui Indians—The Oplate Indians—Visit from Tanori, an Oplate chief—Other Indian tribes of Sonora—Exports—Narrative of an expedition against the Apaches—My party leave me and go to the Gila—Taken to Dr. Campbell's—Irruption of the Apaches—Imbecility of the Mexicans—Tanori and the Oplate Indians go in pursuit—Visit from the Coco-Maricopa Indians of the Gila—Good news from Tanori—He defeats the Apaches and recovers the stock—Entrance of the victors with the recovered booty into Ures—Death of General Garcia Condé—His character—An American held in bondage—Arrival of General Flores—Departure for the coast.

October 6th. We left La Magdalena in the afternoon, taking a south-easterly course across a plain covered with grass and mezquit bushes. There was no wagon road, wheeled vehicles not yet being used. We followed a large and well beaten road, which, though traversed by thousands of animals and pedestrians, was in many places, where it wound over the hills, no more than a narrow path twelve or eighteen inches in width. Crowds of people returning to their homes lined the road; so that we had no lack of company. We are still in a country infested by bands of Apaches, who

prowl among the mountains and pounce upon any small and unprotected party that may fall in their way. We journeyed but twelve miles when we encamped.

* * * * *

With the above, my diary breaks off. The following day, I felt quite ill, and when we encamped, early in the afternoon, was unable to record what had passed or to make any notices of the country. The day after, my illness continued, and my appetite left me entirely. I still kept in my saddle, and, by stopping every hour or so and lying down, was enabled to reach a camping place early in the day. Ranchos and villages being at short distances apart, we found no difficulty in halting where it suited our convenience. On the sixth day after leaving Magdalena we reached *Ures*, passing through the villages of *Cucurpe*, *Tuape*, *Opo-depe*, and *Rayon*, a distance of forty leagues. It was a most painful journey to me. I was obliged to keep on horseback, there being no other means of conveyance. During the day, between the hours of ten and four, the sun was intensely hot, and the rays from the light colored soil gave me a severe pain in my head. I used an umbrella when the wind did not blow, which gave me some relief; nevertheless, I was compelled to make frequent stops, and avail myself of a bushy tree or shrub that afforded a shade, where I could lie down and rest. I would willingly have stopped; but the miserable little places we passed afforded no comforts, and my companions agreed with me that it was best to push on for *Ures*. As the nights were cold, requiring two or three blank-

ets, it was necessary that I should go into quarters and keep as quiet as possible. Two of the party therefore rode on in advance, taking with them my letters to Governor Aguilar. We reached the borders of the town before they rejoined us; and I was glad to throw myself on a tent cloth in the shade of a mezquit tree, and there await the return of my friends. Soon after they came, but had only succeeded after much search in obtaining a room in the rear of an unoccupied shop, of which I at once took possession. The walls were of uncolored adobe, and the floor of brick, while the light was admitted from a small barred window resembling that of a prison, which opened into a court yard. My furniture consisted of my portable cot, a leather pannier which contained a small portion of my clothes, and a camp stool. The morning after I arrived, the Governor, Don José de Aguilar, called on me and kindly offered his services; but I was too ill to say much, or even listen with attention. An American physician, Doctor Campbell, who had long resided in the place and had been a resident of the State for some twenty-five years, hearing of my arrival, came at once to see me; and from what he said, I found that my illness was a serious one, and that I should not be able to leave for a long time. Doctor Webb remained with me; and my servant, a faithful Irishman named William Turner, also occupied a corner of the room. After being here about two weeks, I was carried to other and somewhat more comfortable quarters.

My new room was about twenty-five feet square, with a brick floor and colored walls; and as is generally the case with the smaller apartments in large

houses, there was no window, the light being admitted from the door. But the greatest deprivation was the want of a fire-place, of which I afterwards learned there was but one in the whole town, and that was in the house of Doctor Campbell. This gentleman sent me a table and a couple of chairs; so that in the matter of furniture I now considered myself well off.

About this time, finding my fever was of such a nature that it would be weeks, if not months, before I should be able to resume my journey, I thought it best to send Doctor Webb, Mr. Thurber, and Mr. Cremony to Guaymas, on the Gulf of California, for the purpose of negotiating my drafts, to enable me to pay for the provisions and mules I had purchased. They accordingly left for that place, Mr. Pratt and his son remaining and occupying an apartment next to mine.

Doctor Campbell, to whom I shall ever feel under the deepest obligation for his kindness and constant attention, visited me daily, and often called two or three times during the twenty-four hours. I had occasional visits too from Dr. Wallace, an English physician who had formerly been in practice at Ures, but had lately abandoned the profession, and was then engaged in working a silver mine, about twenty miles off. There was also a German physician, Dr. ———, of Hermosillo, who made me several calls; so that on the whole, although my comforts were few, I was well provided with medical attendance. I felt the want of a fire the most, for I never slept with less than four heavy blankets over me. These, it is true, kept me comfortable at night; but during the day, in the months of November and December, when I wished to sit up,

I felt much inconvenience from the cold. The lowest point at which I noticed the thermometer was 40° Fahrenheit; which for a sick man, with no fire, and the door open to admit light, cannot be said to be comfortable. Nevertheless, thanks to an all-protecting Providence, and the excellent attendance I enjoyed, the privations I was subject to did not prevent my recovery; and by the middle of December, I was able, with the assistance of my friends, to walk out.

Dr. Webb and his party reached Guaymas in safety; but there he was taken ill with a fever, which detained him two weeks beyond the time allotted for his journey. The others also had slight attacks. On their return, I was still very weak, though convalescent. Dr. Campbell, who had had much experience in the fevers of the country, said it would not be possible for me in my enfeebled state to make the long journey to the Gila, where our surveying parties were, and thence to California. Both he and Doctor Webb advised that I should remain in Ures until my strength was sufficiently restored to enable me to proceed to Guaymas, and should then embark in some sailing vessel for Mazatlan, from which place I could take passage for San Diego, in California, where the engineering parties would meet me. As soon as I determined on this step, I considered it best that the party which had accompanied me should retrace their steps to Santa Cruz, and from that place rejoin the parties on the Gila.

On the fifteenth of December, the party took leave of me and set off, accompanied by eight Mexicans, whom Governor Cubillas had kindly provided to escort them as far as Santa Cruz; there they hoped to find

General Condé or some of the Mexican Commission, from whom a further escort could be procured to the Gila. Our journey to Ures through the unfrequented parts of the State, although unattended by any attacks from the Indians, had not been without danger; and as it was known that bands of Apaches were prowling about, and had committed many depredations in the vicinity of the town, the authorities did not think it safe for our small party to return without protection.

Being now left alone with my faithful attendant, William Turner, who did duty in the triple capacity of servant, nurse, and cook, my excellent friend, Dr. Campbell, insisted on my taking up my quarters in his house, where I should be better provided for, and where he could more easily attend upon me. On the sixteenth of December, I removed to the Doctor's, where, among other things, I had the luxury of sitting by a fire, and of receiving many attentions from his kind and amiable lady, such as can be appreciated only by those, who, having a family and a home, are taken sick among strangers in a foreign land. Dr. James W. Campbell is a native of Virginia. His father was connected with Lewis and Clarke, the pioneers in the exploration of the Rocky Mountains, and was an agent of the United States in some negotiations with the Indian tribes west of the Mississippi. This led his son, the Doctor, to New Mexico, and thence to Chihuahua and Sonora. He married in the latter State, and entered into the practice of medicine, for which he had been educated. Every American who comes to the place where the Doctor resides, is certain to find in him a sincere friend.

URES (pronounced *Oo-ress*) was originally a missionary establishment, and among the earliest in the State. Not many years before the expulsion of the Jesuits, they commenced here the erection of one of the largest churches in the country; and when that event took place, the walls had been raised about half their intended height. The thirty years' neglect, however, which it has suffered since that time, has reduced it to a mass of crumbling ruins. Adjoining it are the remains of a smaller edifice, which is now being rebuilt. A prison, or house of correction, a plain adobe structure, is as yet the only public building in the place. About a mile from the town an *Alameda*, or public park, has lately been laid out and planted with trees; but so primitive is its appearance, that one would hardly recognise it as any thing more than an ordinary field and garden.

During my residence here, Governor Aguilar resigned his office, and his successor, Don Francisco Cubillas, was installed into his place. Like his predecessor, Governor Cubillas is an accomplished gentleman. He has spent many years in Europe and the United States, has a highly cultivated mind, and speaks the English language with fluency. He manifested much interest in the objects of our commission, particularly in the scientific investigations, which I told him we were making. During my illness, he extended to me many attentions, for which I shall ever hold him in kind remembrance. To get my party off, and support myself, while at Ures, of course required considerable money. This he kindly proffered to me to any amount, although I could see no way of repaying him under many months.

The Legislative Hall is a plain adobe building, distinguished from others only by a flag-staff. The Assembly consists of but eight members; and one would suppose that so small a body would be remarkable for the harmony of its proceedings. Yet I was told that a large portion of its last session was spent in disputes about the qualifications of three of its members, and that it had adjourned without transacting any public business. A newspaper called the *Sonoriense*, the only one in the State of Sonora, is issued here weekly, and is chiefly devoted to the publication of laws, the proceedings of the State Legislature and general Congress of Mexico, and other matters of an official character.

The town is regularly laid out in squares, a large church and accompanying plaza occupying the centre. The church is a plain, substantial edifice, with a tower and dome, corresponding in general appearance with others throughout the country. The houses are well built and in general spacious, better, in fact, than any we had seen, except a few at La Magdalena. Although but of one story, they are about eighteen feet in the clear. As brick is used for cornices and other exterior ornaments, and as many of the houses are plastered and colored, the town has a pleasant appearance. Its streets, too, unlike most Mexican towns, are quite clean.

Hard by runs the Sonora River, the bottom land of which, extending for more than a mile on either side, is exceedingly fertile. Its use, however, is almost wholly confined to the production of corn, wheat, beans, pumpkins, and chili. Vegetables, which one would expect to form a large part of the subsistence of the people, are scarcely cultivated here, and

during my residence of three months I saw none. Oranges, lemons, quinces, pomegranates, and peaches, abound. There is, too, a solitary date-tree within the

Date Tree, Ures.

limits of the town; but I could hear of no others near, and presume this to be an exotic. The sugar cane grows remarkably well in the bottom lands, and is cultivated in sufficient quantities to supply a small sugar mill. Nothing, however, is made but the common *pilonce*, an article inferior to the most ordinary brown sugar of commerce. Cotton of a superior quality, I was told, is raised here, though not to any extent.

The plain on which the town stands is intersected with many *arroyos*, or dry water-courses, which, after heavy rains, become filled, inundate the country, and endanger the town. Several extensive haciendas are situated in the vicinity; among which are those of Santa Rita, El Molino, Guadalupe, and Tapahui.

A theatrical company from Mazatlan was performing while I was a resident here; but, either from want of patronage or indolence in the actors, the representations took place only once or twice a week. Each entertainment was publicly announced by a troop with a band of music parading through the town. The theatre was a court yard in the open air, and the stage a rude frame work filled with earth; the spectator being at liberty to look before or behind the scenes, as best suited his taste. Seats were not furnished, each person bringing his own, or standing during the performance. The prompter was ensconced in a sort of well in the front part of the stage, his head covered with a tin-plate screen, which strongly resembled a patent Dutch oven. He read the entire play in an under tone, and the actors repeated it after him. The whole affair was tedious, and a poor apology for an evening's entertainment.

The laborers of Ures and of other towns in the central and lower parts of Sonora are the Yaqui Indians. They fill the same place and perform the same duties as the lower class of Irish do in the United States. I was told that they are invariably honest, faithful, and industrious, traits of character which cannot be said to belong to the lower order of Mexicans. I saw these men at work in a broiling sun, with no garment save

a bit of cloth around their loins, and a straw hat upon their heads, making the adobes or sun-baked brick, and laying them in the walls. Others were laboring in the fields; and, in fact, the hard work whatever it was, seemed to be performed by these men. They are also the fishermen and the famous pearl divers of the Gulf of California. These Indians were in the early history of the country extremely warlike; but on being converted to Christianity, their savage nature was completely subdued, and they became the most docile and tractable of people. In the civil wars of the State, some thirty years since, they took part with one of the factions; and when this strife had passed away, it was not easy to subdue again the dormant propensities for war which had thus been aroused. They are now very populous in the southern part of Sonora.

The Yaquis were among the first to be converted by the Jesuits; who used them as it is said the Egyptians did the Israelites, making them perform all the manual labor of the missions. They became excellent mechanics, and built the churches and missionary establishments of the country, as well as the *presidios* or garrisons. In addition to the tithes, they were also made to pay tribute, either in labor or the products of the soil. When their old masters were banished the country, "the name of Jesuit was converted into that of cura, and slavery was by the same ingenious artifice changed to servitude. Priests, who from bad characters were suffered to reside no where else, obtained their living from a Yaqui congregation; and it was as common in Mexico to banish a friar to a Yaqui eccle-

siastical establishment, as any other culprit to the frontier presidios."

Being desirous to obtain a portrait characteristic of this large and once powerful tribe, I made my wish known to Governor Cubillas, who sent a man to me for the purpose. He had a mild expression of countenance and was considered a good specimen. Mr. Pratt obtained an excellent likeness of him*; though the fellow became so alarmed at seeing himself transferred to canvas, that he would not return to have it completed. On expressing my desire to possess a full vocabulary of their language, I was told that Padre Encinas, the learned and venerable priest attached to the church here, was so familiar with it, as to be able to write and preach in it. I accordingly called on him with a friend; when he readily complied with my request, and furnished the corresponding Yaqui for the two hundred words in my vocabulary.

Another large tribe of Indians in this State is that known as the Oplate. They are found in the central parts of the State, and are chiefly devoted to agriculture. They live in villages, and are in general a quiet and well disposed people. Between La Magdalena and Ures we passed several villages of Oplates, who in dress and appearance were quite as respectable as their Mexican compatriots. These people, however, are most noted for their bravery, being the only ones who have successfully contended with the savage Apaches. On many occasions they have been called out under their leader *Tanori*, who receives regular pay from the government, and always holds himself in readiness when he knows the common enemy is among them.

Ever since the conquest of the country, the Oplate tribe has manifested a frank and docile character, sympathizing in all things with the whites. They early became converts to Christianity, and have ever remained faithful to their religion. Of their attachment to law, order, and peace, they have given the most unequivocal proofs.

Three companies of infantry formed from them, were stationed at the frontier towns of Bacuachi, Tubac, and Babispe; and there, it is said, for a series of years, they performed many acts of extraordinary valor, one of them having often been known to contend successfully against eight or ten Apaches. In the civil wars of the State, they also took conspicuous part. Their sense of propriety is manifested in always being well clothed with a clean white shirt and pantaloons, while their Yaqui brethren prefer going naked, or nearly so. Besides soldiers, they are excellent couriers, and are often employed to carry messages long distances on foot, running the greater portion of the way. In twenty-four hours, they have been known to run from forty to fifty leagues.*

While I was confined to my room, I endeavored to collect such information as was within my reach relating to the Indian tribes of the State; and as I wished to obtain a portrait of an Oplate, Governor Cubillas was so kind as to send for *Tanori*, the head chief of the nation, (to whom I have before alluded), who lived thirty leagues distant. A few days after, the Chief promptly reported himself at my quarters, accompanied by his

* Velasco. Noticias del Estado de Sonora.

wife He was indeed a fine specimen of a man, being full six feet high and well proportioned, with a light complexion for an Indian ; large piercing eyes, prominent and high cheek-bones, and a most determined expression of countenance. He often smiled, when his face wore an expression full of benignity. He was delighted when I told him that his portrait would be sent to Washington, where the President of the American people lived, and there hung upon the walls of a great room with those of other celebrated chiefs of the Indian tribes within the borders of the United States.

Mr. Pratt, the artist of the Commission, was ready when the Chief appeared, and at once proceeded to transfer the faces and busts of himself and wife to canvas. They remained in town for a week, and were promptly on the spot when required for their sittings. Tanori wore a large *serape* of dark blue broadcloth ; the opening in the centre for the head being surrounded by a broad band of green velvet, bound with heavy gold lace. His garments beneath this were simply a shirt and pantaloons. His wife, who always accompanied him, was quite small, with a delicate complexion for an Indian, though strongly marked with the characteristics of her race. Tanori was greatly pleased with his wife's portrait, and expressed a strong desire to possess it. I promised him that if it should ever be published, I would send him a copy. From this chief I also obtained a full vocabulary of his language.

The other tribes of Indians in Sonora, are the Mayos who reside in the southern part of the State ; the Tarahumaras or Taraumaras, who occupy the western portion adjacent to the Sierra Madre ; the Yumas and

Cocopas of the Colorado; the Papagos of the interior; the Pimos, and Coco-Maricopas, of the Gila; the Ceres of the Gulf of California; and the Apaches. Of each of them I shall speak hereafter, in their proper places.

The exports from Sonora are chiefly wheat and flour. Copper was formerly exported in considerable quantities; that is now no longer the case. There was also an extensive trade in pearls, which were collected by the Indians of the Gulf; but I could not learn that much is now done in it. Silver and gold are among the exports; but even of these the amount is less than in former times.

Scarcely a week passed during my stay at Ures, that I did not hear of murders and robberies by small bands of Apaches in the neighborhood. On one occasion, sixteen valuable horses were stolen from a single hacienda, and a boy was carried away captive. Another time, several mules were taken from a rancho within a mile of the town, and the owner killed. Yet not an arm was raised in defence, nor were any steps taken to hunt out the thieves and murderers. I cannot refrain from relating here an incident that took place near one of the frontier towns, which affords a good illustration of Mexican pusillanimity.

A band of Apaches, venturing into the interior of the State, stole a large number of horses and mules, which they were driving off. No efforts had been made to check them, until at length a party of some forty-five men armed with muskets, united for the purpose. One of their number was an American, who took a prominent part in the expedition. They soon fell into

the trail of the robbers ; and about midnight, on reaching the top of a hill which overlooked a valley, they discovered the enemy below them, lying asleep around their camp fires ; while at a short distance, their herd of stolen animals were grazing. A small party sent down the hill to reconnoitre ascertained that the Indians were but twelve in number. It was then proposed by the American, that he, with such others as would venture with him, should approach as near as possible, and each pick off his man ; which should be a signal for the rest to rush forward and overwhelm them. The plan was agreed to, but only two Mexicans and one Opaté boy, would venture to accompany the American.

The four crept quietly to within fifteen paces of the Indian camp, and took their position behind some bushes for concealment. Just as they were preparing to fire, a tremendous shout was heard, with a confused discharge of fire-arms from the party left on the hill. The Indians sprang at once to their feet and ran some paces back, leaving their bows and lances ; but finding they were not pursued, they soon ran back and secured them. The small party of four, who were thus placed in an awkward predicament, endeavored to make good their retreat, dodging behind rocks and bushes, and occasionally discharging their guns at their pursuers, who were armed only with bows, arrows, and lances. On reaching the summit of the hill, their surprise was great to find that the cowardly crew left there, had abandoned their post and were in full retreat, driving some of the stolen animals, which they had managed to secure, before them.

After the Oplate boy had been killed by the arrows of his enraged pursuers, his three companions succeeded in regaining their horses, and pushing on after the main body of the party. The Indians, meanwhile, had got before them, and, riding fearlessly up to the retreating Mexican horsemen, plunged their lances into their backs. Not one attempted to defend himself, or to discharge his gun. Quietly they submitted to be transfixed by the enemy's lances, until seven were killed. The American fearing all would be cut off, told them they must adopt one of two alternatives, as the only means of saving their lives; namely, either make a stand and defend themselves, or abandon the recaptured animals. The latter course was pursued. The animals were left; and the Apaches, having again secured their stolen property, retired.

This narrative exhibits the poltroonery of the Mexicans in no stronger light than do incidents continually taking place. I have been told by many Mexican gentlemen and military officers, that ten Apaches will put a hundred of the lower class of their countrymen to flight. They become panic-stricken; and if forced to discharge their guns, they do so at random, turning their faces and generally closing their eyes. In Chihuahua I heard of several stratagems used by the Mexicans, by which they had overpowered their adversaries; but in open fights, which are very rare, the Apaches are generally the victors. We often hear of the effect of fear upon a single mule, which will stampede a large herd, without their knowing the cause of the alarm. The Mexicans seem to be possessed of similar fears, which produce similar results.

On the 15th of December, I had so far recovered from my illness as to sit up the greater part of the day, and to walk out without assistance, although still very weak. I sometimes felt my strength failing me entirely, and my limbs becoming almost destitute of sensation. On this day, I resumed my diary, which had been suddenly broken off on the 5th of October.

The gentlemen of the Commission who had accompanied me to this place took leave of me to-day, to retrace their steps to Santa Cruz, and thence proceed to rejoin the surveying parties on the Gila. The party consisted of Dr. Webb, Mr. Geo. Thurber, Mr. H. C. Pratt, Mr. J. J. Pratt, and their attendants. They were kindly provided with an escort, as I have already mentioned, by Governor Cubillas. Not having any troops at his disposal, he gave me an order on the Alcalde of each town through which Dr. Webb and his party should pass, who were required to furnish him with eight mounted and armed men to the next town, and so on, to the place of his destination.

December 16th. News was brought in to-day that a large band of Apaches were ravaging the country to the west; and that after attacking and robbing several haciendas, they had proceeded southward towards Hermosillo.

December 19th. The town was thrown into a state of alarm, by the news of a fight between a body of Mexicans and the Apaches before referred to, in which the former were completely cut to pieces. It seems that an effort had been made to arouse the inhabitants of Hermosillo to their danger, and induce them to send

out a force to expel the invaders. But strange as it may appear, this town, with a population of thirteen or fourteen thousand souls, could muster only forty hired men to send against a party of about one hundred Indians, who were ravaging the richest portion of the State, murdering its inhabitants, destroying their crops, and robbing the haciendas and ranchos of their most valuable stock. These men were armed and mounted, and sent in pursuit under the command of an officer. They came up with the enemy about five leagues from Ures; but what was the result? The Indians immediately made a desperate charge upon the Mexicans, putting the whole body to flight, and killing about thirty of their number. The officer and a few others, who succeeded, after being hotly pursued, in making their escape to Ures, reported themselves to be all that survived; but a few stragglers subsequently turned up. The officer's own excuse was, that his men all fled; and it being useless for him to attempt to cope with the enemy single handed, he was obliged to run with the rest to save his life. I saw a gentleman a few days after, who visited the spot where the fight took place. The Mexicans were all *lanced in the back*, and their muskets, which were found lying by their sides, *had not been discharged*. The Apaches care little for fire-arms themselves: they can neither keep them in order nor obtain ammunition; and as long as they have nothing but Mexicans to contend with, their bows, arrows, and lances, are quite sufficient.

December 20th. A band of fifty Indians of the *Coco-Maricopa* tribe, from the river Gila, arrived in town this morning. The object of their visit was to com-

plain to the Governor of the attacks made on them by the Yumas of the Colorado and the Apaches, and to beg that they might be furnished with fire-arms to defend themselves against the common enemy. These Indians had a totally different appearance from any I had seen. They were entirely destitute of clothing save a breech-cloth of coarse stuff of their own manufacture. They wore no covering on their heads, and were without any protection to their feet. Their hair seemed never to have been cut, but was clubbed up in a great bundle, and hung about half-way down their backs. In front, it was cut off straight across the eye-brows, while the earlocks were suffered to fall down by the side of their faces. On being informed by Governor Cubillas, that there was one among them who spoke Spanish well, and acted as the interpreter of the band, I requested that he would do me the favor to send the man to me. He readily complied with my request, and in the after part of the day the Indian, with several of his naked companions, presented himself at my quarters. I kept them a couple of hours, taking down a vocabulary of their language; at the end of which time, they exhibited much drowsiness, and said they were hungry. I sent out for some bread, but asked them to wait until I got through before eating it. They could not be restrained, however; and finding it no easy matter to take down their words while they were munching their food, I was obliged to give up the task, with a request that they would call on me again in the morning. These men readily answered all my questions about the Gila; and I learned from them that, a short time before, a party of Ameri-

cans had passed through their villages, which, from their account, I believed to be the engineers of the Boundary Commission. One of them had several notes from Americans who had passed through their country, certifying to their friendly disposition, and requesting kind treatment for them in return.

December 21st. My Indian friends were at my quarters by eight o'clock, accompanied by several of their companions, three of whom, claimed to be "capitans," or chiefs. Whether they were or not, I cannot say, but believe they styled themselves such, in order that they might with more propriety claim some presents from me, and particularly some recommendations. These certificates they prize very highly, on account of the favors they procure from emigrating parties passing through their country. I gave testimonials to the three who called themselves chiefs, stating that they were friends of the Americans, and requesting my countrymen to treat them kindly and deal fairly with them. I attached to each note a large red seal and a piece of red ribbon, which decorations pleased them much. These acquisitions were carefully enveloped in several wrappers, and then put into a deer-skin pouch, which was fastened around their waists. Having completed my vocabulary, I presented them all with some bread, and also several yards of heavy cotton cloth, which they expressed a desire to have above every thing else. They gave me their names as, *She-pan-wa-ma-ki*, *Hum-su-il-lya*, and *Che-ma-dul-ka-keo*.

The pleasing news arrived by courier that Tanori, the Oplate chief, who went in pursuit of the Apaches before mentioned, had given them battle this morning

and completely routed them, killing many of their number and recapturing the animals which they were driving off.

December 23d. This morning, when walking near the town, I perceived a cloud of dust on the plain, which I soon discovered to proceed from an immense drove of animals approaching. As they drew nearer, I saw that they were escorted by a body of armed men on horseback and on foot, who seemed to be in high glee, and who were saluted and cheered as they passed by the crowds who met them. They proved to be the horses and mules recaptured by Tanori from the Apaches, which were now being brought to Ures, to be reclaimed by their respective owners. I was subsequently informed by the Governor, that there were eight hundred and sixty animals altogether, and that among them were some hundreds of the finest stock in the State. They were placed in the plaza, where the owners on identifying them, and paying three dollars each, were permitted to take their property. This charge was to defray the expense of driving them in, and for subsisting them.

An incident connected with the expedition of Tanori, deserves to be mentioned here. At the first fire of his men six Apaches were killed, and one was left by his companions mortally wounded. This man sat alone on the plain near a tall petahaya, the blood trickling from his wound and gasping for breath; but at the same time, clenching in his death-grasp his full drawn bow. His pursuers were thus kept at bay, knowing the certainty with which an Apache warrior marks his victim. The Opates were all armed with muskets or

escopettes ; and they discharged no less than ten shots at the dying Indian, not one of which took effect. At length an Oplate lad of sixteen boldly advanced with his gun to within a short distance of the wounded man. The quick eye of the Apache was fixed on his antagonist as he approached him. The young Oplate levelled his gun and quickly pulled the trigger. The Apache at the same instant let fly the never-failing and deadly arrow, which, skimming over the plain, buried itself deeply in the neck of the warrior boy, and laid him dead on the spot. The ball of the Oplate was equally sure. Both were slain.

December 24th. Dr. Vassbinder, a physician from Canada, attached to the Mexican army, arrived to-day from Arispe, bringing the painful news that General Garcia Condé, the Mexican Commissioner, had died at that place on the 19th instant. I learned from him that the General, whom I left at Santa Cruz on the 29th of September, was taken ill a few days after, and lay for some time at the point of death. On getting somewhat better, he was with much difficulty carried to Arispe, where he could have the benefit of a physician, besides having more comforts than in such a filthy, miserable, and unhealthy place as Santa Cruz. But the journey was too much for him : he suffered a relapse which baffled his attendant's skill, and died on the 19th instant. It was a singular coincidence that the General, who had left Arispe when quite young, had not visited it again until he was taken there to die ; and that this event should occur in the very house in which he drew his first breath. General Condé was but 47 years of age. He was an accomplished engineer, and a most amiable

and estimable gentleman. Our intercourse had been of the most friendly and agreeable character ; and he had ever shown himself ready to aid the American Commission, while we were within the jurisdiction of Mexico, in any way that lay in his power. He had filled many important positions under his government, among which I may mention those of Secretary of War and the Navy, Director of the Military College, and Deputy from the State of Sonora to the Mexican Congress.

I received a letter to-day from Dr. Webb, announcing the safe arrival of his party at Magdalena. He gave me an account of an American named English, whom he had found at the village of Rayon, where he was kept in bondage by a Mexican. This man, who professed to be of a respectable family, had found his way into this country during the war, and had been taken into custody by the man he was still with. He stated that he was not permitted to communicate with his friends, and had no means of escaping. I made the facts known at once to Governor Cubillas, and requested him to investigate the matter, which he assured me he would do immediately.

December 25th. General Flores, Commander of the military forces in Sonora, Colonel Garcia, a gentleman whom I had before seen in Arispe, and Captain Morfi, arrived from Arispe and called on me in the evening. From them I learned additional particulars of General Condé's illness and death.

December 26th. Time was now hanging heavily on my hands. I felt extremely anxious to get off, but was still unable to sit upon a horse. The usual mode of travelling through Sonora is on horseback, while pack-

mules do the transportation of goods. There are a few wheeled vehicles here, and among them some very fine private carriages, which are used between this and Hermosillo, where the road is good; but they cannot be employed except with difficulty in traversing other parts of the country, owing to continuous mountain chains which intersect the State on the north, east and south. Governor Cubillas had interested himself much for me, and promised to apprise me of the first opportunity that offered to go to Guaymas, or even to Hermosillo. To-day he called with the pleasing news that in three days I should have a conveyance.

It did not take me long to prepare for my journey; for when I left my party on the San Pedro in September I expected to be back in eight or ten days, and consequently made but small provision for my trip. My wardrobe therefore was very meagre. A portable cot, bedding, and a single camp stool, with my fire-arms, constituted all my other effects. I now found it necessary, to procure some cooking utensils, and a few articles for a camp chest, as there are no hotels in the country, or any public places of entertainment. Besides these, I had to get an animal for my servant to ride, and two pack-mules, for transporting the luggage, and an arriero to attend to them.

CHAPTER XX.

URES TO GUAYMAS.

Leave Ures—Rich valley—Tapahui—Don Manuel Gandera—His large estates—Successful farming—Statistics of his haciendas—Silver mine—Reach Hermosillo—Governor Aguilar—The Ceris Indians—Obtain their language—Account of the tribe—Mode of poisoning their weapons—Description of Hermosillo—The Sonora River—Productions of the valley—Business relations—Sketch of the town—Departure—Meet French emigrants—Description of the country—Its barrenness—Business-like mode of milking cows—La Cieneguita—Buena Noche—Reach Guaymas—Mr. Robinson, the U. S. Consul—Description of Guaymas and its Campo Santo—Its harbor—Commerce—Intense heat—Departure.

December 29th. The carriage which my excellent friend Governor Cubillas had secured for me, was at my door in good season this morning. It was a small Scotch built vehicle, of an antiquated form, with two wheels, and very comfortable. Taking leave, therefore, of my kind and attentive physician, Dr. Campbell, and his amiable wife and family, to all of whom I shall ever feel grateful, I was helped into my chaise and bade adieu to Ures, where I had been confined eighty days. I still felt very weak; but my appetite was good, and I hoped the exercise of riding would be beneficial.

The road from Ures is excellent for several miles, extending along the bottom land of the Sonora River, which is one continuous cornfield, to the village of Guadalupe, six miles distant; after that, still keeping in or near the valley, and often crossing the stream, the road becomes more hilly, and in many places there are bad gulleys. It is then hard and smooth to Tapahui, twenty-seven miles from Ures.

I reached this place, the residence of Don Manuel Gandera, the former governor of Sonora, at 4 P. M. Having a letter of introduction from Governor Cu-billas, I drove at once to his hacienda. I was kindly received by Mr. Rohnstadt, a German, the head manager of the extensive estate of Don Manuel, who was absent, having a few days before gone to Guaymas.

The whole village of Tapahui belongs to Señor Gandera, who is reputed to be the richest man in the State. He cultivates with great success many miles of the luxuriant bottom lands of the Sonora River, which runs directly through his estates, and from which they are irrigated. The houses are of adobe, well built and spacious. They stand chiefly around or immediately adjacent to a large plaza, and are exclusively occupied by the overseers and employees of the owner.

Mr. Rohnstadt accompanied me over the place, and cheerfully answered all my inquiries. And on my expressing a desire to know the statistics of the estate, which showed the most successful farming I had yet seen in Mexico, he invited me into his office. Requesting me to be seated, he took down the farm book, and turned to the result or balance of the pre-

vious year, from which he permitted me to make the following extract:

8000 fanegas (about 21000 bushels) of wheat,
 2000 " (" 5250 ") of corn,
 500 " (" 1050 ") of beans [frijoles],
 250 " (" 656 ") of barley,
 100 " (" 262 ") of pease,
 70 wagon loads of sugar cane,
 From 60 to 80 loads of soap, worth \$30, each.

In addition to the above there was raised a variety of vegetables, which were furnished to his laborers, and never sent to market. Such were the agricultural products of the estate.

Don Manuel, besides being an agriculturist, is one of the most extensive raisers of stock in the country, as the following list of animals now on his farms will show :

16,000 sheep,	
700 mules,	
108 stud horses,	
1620 breeding mares,	
348 cow calves,	
355 bull calves,	
62 young mules,	} product of last six months.
269 mare colts,	
165 stud colts,	

The wool gathered from the sheep is manufactured into *serapes*, or blankets. Of these there were made by hand during the year nearly fifteen hundred, vary-

ing in value from four to eighty dollars each. Mr. Rohnstadt showed me piles and bales of these articles ready for market, many of them of brilliant colors and fine texture. The serape is the principal garment of the Mexicans. It serves them as a covering at night, and is alike worn to protect them from the cold and from the rain. A considerable demand therefore exists for the inferior qualities among the hands on the estate.

One would suppose that the cultivation of such large farms, and the raising of so many horses, mules, and cattle, would be sufficient for one man to attend to successfully; but Don Manuel does not stop here. He is the owner and successful operator of a large cotton mill near Tapahui, which I had not time to visit, and of a silver mine.

The books of this gentleman were admirably kept, exhibiting a correctness of system which would be creditable in the counting-room of one of our New-York merchants. Mr. Rohnstadt kindly permitted me to make the following abstract of the list of employees on his establishment.

414 laborers,
52 muleteers,
19 mechanics,
23 herdsmen,
16 shepherds.

This list embraces those only who were employed on the farms.

He possesses also a silver mine, which had been

worked for only five months. In it are employed eighty-five men, who receive from six to twelve dollars a month and their subsistence. The last monthly payment for wages and rations amounted to thirteen hundred and fifty-nine dollars. (\$1,359.) The produce of this mine the first five months after it was opened, amounted to fifteen thousand nine hundred and fifty-six dollars. (\$15,946.)

The comforts and conveniences about the house, I cannot say were in keeping with the magnificent scale of the establishment. But this is excusable in a place situated so far in the interior, when even on the coast at the port of Guaymas, the luxuries which wealth usually commands are not to be obtained. The enjoyment of these must be left for the next generation.

December 30th. Left Tapahui after breakfast. The natural road continued down the valley, hard and smooth, and was quite equal to a well made turnpike. Passed several haciendas and ranchos, with extensive and highly cultivated grounds. The chief products seemed to be wheat, with a limited proportion of corn (maize) and beans. Little attention seemed to be paid to the cultivation of other cereals, fruit, or vegetables. The heat was very oppressive, there being no top to the chaise; but as the road continued good, I hurried on, and at 4 o'clock reached Hermosillo, distant twenty-seven miles. I drove at once to Señor Majocci's, an Italian, to whom I had a note from Mr. Thurber. Mr. M. gave me an excellent room in his house, to which I had my baggage transferred and my cot set up, and furnished me with other conveniences to render me as comfortable as possible.

December 31st. Mr. John P. Brodie, a Scotch gentleman, called on me early this morning. Mr. Brodie has been in Mexico thirty years, during which time he has resided chiefly in Sonora. He is a gentleman of intelligence, of thorough business habits, and is much respected by the Mexicans, as well as by all who come in contact with him. Mr. B. like many foreigners who come here, married a Mexican lady; and by her he has had nine children, most of whom are living. Don José Aguilar, who was Governor of the State, and resided in Ures when I arrived there, also called this morning. He informed me that on the Monday following, he should set out for Guaymas, and politely offered me a seat in his carriage. This was as pleasing as it was unexpected; for the conveyance I had had was only to this place, and I had to take my chance of getting to Guaymas the best way I could. I should else probably not have got off under a week or ten days, nor would the means offered have been so well suited to my feeble condition. I had now only to obtain pack mules to carry my baggage, and arrieros to take charge of them. But to relieve me of all trouble, Señor Aguilar kindly offered to make arrangements for these also.

Desiring to employ my time to some advantage during my stay here, I requested the aid of Governor Aguilar in procuring an Indian of the *Ceris* tribe from whom I could obtain a vocabulary of his language. This he had promised me to do when I met him at Ures; and at once he despatched a messenger to a pueblo or village of these Indians near Hermosillo. The person sent for made his appearance in a few

hours, accompanied by several young Mexican gentlemen of education, who remained during the interview, manifesting much interest in my undertaking, and assisting me in obtaining the words correctly. The native was a good looking man, about thirty years of age. His complexion was fair, and resembled that of an Asiatic rather than an American Indian. His cheekbones were high, and his head round and well formed, though the anterior portion was somewhat angular and prominent. His hair was short, straight, and black. He was a full-blooded Ceris, and came originally from the island of Tiburon. In about three hours I completed the vocabulary quite satisfactorily to myself, and somewhat to the surprise of my Mexican friends when they heard the Indian so readily recognise each word as I read it off in his native tongue, and then give me the Spanish equivalent. I found it an extremely harsh language, very difficult to express with our letters, and totally different from any aboriginal tongue I had heard spoken.

The Ceris tribe of Indians, with the exception of those which are christianized and reside in the village near Hermosillo, occupy the island of Tiburon in the Gulf of California, north of Guaymas. Although believed not to number over one hundred warriors, they have long been the dread of the Mexicans between Guaymas and Hermosillo, as well as the country to the north, on account of their continual depredations and murders. Their practice is to lie in wait near the travelled roads, and there surprise small and unprotected parties. Their place of abode being on an island or the shores adjacent, and their subsistence being

chiefly gained by fishing, they have no desire to steal animals, which would be of no use to them; nor do they take any prisoners. To murder and plunder small parties of Mexicans, seems to be their only aim, and every arrow or lance thrown by the Ceris that pierces the skin, causes death, as all are poisoned.* Many expeditions, fitted out at a great expense, have been sent against them; but, though commanded by competent officers, all have failed. The number being so small, they manage when pursued to conceal themselves where they cannot be found. The island of Tiburon, as well as the main land adjacent, is exceedingly barren and destitute of water; hence parties have suffered greatly in the campaigns against them, without accomplishing any thing. I was told that the government had already expended more than a thousand dollars for every male of the tribe. The last serious attack of these people was made upon a gentleman travelling to Guaymas in his carriage with his family and attendants, embracing sixteen persons. They were surprised in an unfrequented place and every soul put to death.

* I was told that the Ceris tipped their arrows with poison; but how it was effected I could never learn. Lieutenant Hardy, who made a voyage up the Gulf in 1826, visited Tiburon, and had some intercourse with this people, thus describes the process: "They first kill a cow, and take from it its liver; they then collect rattle-snakes, scorpions, centipedes, and tarantulas, which they confine in a hole with the liver. The next process is, to beat them with sticks, in order to enrage them; and being thus infuriated, they fasten their fangs and exhaust their venom upon each other, and upon the liver. When the whole mass is in a state of corruption, the women take the arrows and pass their points through it; they are then allowed to dry in the shade."—*Travels in Mexico*. London, 1829. p. 298.

My attentive friends here, particularly Don Francisco Velasco, to whom I feel under great obligations, were quite desirous to know my opinion respecting the Ceris tribe and their language; but it was impossible for me, without a close philological comparison with other Indian languages, to arrive at any correct conclusion as to whether this people are allied or not to other aboriginal tribes. This curiosity arose from a notion, which I found to prevail in many parts of Sonora, that the Ceris were of Asiatic origin, in proof of which, some statements were made too improbable to repeat. This idea seems to have originated from the resemblance between their name and that given by the ancients to the Chinese.

Hermosillo is the modern name for the old presidio of Pitic, which belonged to the company of Horcasitas. It is thirty leagues distant from the nearest point of the shores of the Californian gulf, and thirty-six leagues from the port of Guaymas, which lies nearly south. It is by far the largest and finest city in the State. In 1840, its population was 13,665, including about 2000 Yaqui Indians, who are the laborers of the town and dependent upon it. It was believed to contain 4000 more in 1845, when the essay was written from which I have obtained these facts.* It has a large trade with Guaymas; from there it receives all its goods, which are distributed from Hermosillo throughout the State; and in return, the products of the State are chiefly concentrated here for transportation to that

* Noticias estadísticas del Estado de Sonora, par José Francisco Velasco. *Mexico*, 1850.

place. The climate is dry and exceedingly hot, the thermometer ranging during the day from 95 to 98° Fahrenheit, and often exceeding 100°. Notwithstanding this intense heat, the place is considered healthy, it being free from the epidemics which too often accompany such high temperatures. This may, in some respect, be owing to a westerly breeze, which springs up in the evening, as at San Francisco and other places on the Californian coast, and brings with it the cool air from the ocean. This sudden change of temperature doubtless arises from the intense heat on the desert during the day, when the air in a rarified state passes upwards into the higher regions. As the sun descends, the air rushes in from the ocean to fill up the vacuum. This will account for the prevalence of the south-westerly winds at certain seasons throughout the country between the Gila and the Californian gulf, and the moisture they bring with them. The winter is moderate and the temperature variable, sometimes reaching 90 degrees. The weather to-day, 31st December, would be called hot in New-York; and I noticed that even the inhabitants sought the shady side of the street.

The town lies in a valley almost ten miles in length by four in width. It is closely hemmed in on the east by a mountain or rugged pile of rocks composed of crystallized carbonate of lime, of a beautiful texture, in which white and cream color predominate, relieved by dark and deep indentations. It is called *La Sierra de la Campana*, or the Bell Mountain, from the fact that the sonorous material of which it is composed emits a sound when struck. Several small ranges of mountains, known as the Colorado

and Chanati sierras, encompass the valley, through which flows the Sonora River, furnishing sufficient water to irrigate the lands adjacent. This river, which rises near Cocospera, has two great branches; the eastern or Ures branch generally bears the name of Sonora River. The western branch has several appellations, but it is usually called the San Miguel. They unite near Hermosillo, and, after flowing half way to the gulf, lose themselves in a *ciénega*, or swamp. Along the margin of the city runs a large acequia, which is intersected by others in various parts, furnishing an abundant supply of water, and receiving in return an immense amount of dirt and offal. It is surprising to a stranger to behold the diverse uses to which these acequias are applied. They are in one place a public bathing tub; at another half a dozen women may be seen washing; a little further on an animal is being butchered; and at the next house the people are taking up water for cooking.

Taken as a whole, Hermosillo is the best built town I had seen in Sonora. Some of the private dwellings are large and substantial, with pleasant and tasty exteriors, and handsomely furnished. No houses showing the bare mud walls are seen in the principal streets, as is usually the case in El Paso del Norte, but all are colored, and often ornamented with columns and pilasters in good taste. The court-yards are filled with orange trees and flowering shrubs. The Alameda, or public walk, which extends along the margin of the town, is not yet remarkable for its beauty; time, however, is only wanted to render it a place of great attraction. It is well filled with trees, among which

is the beautiful palm. This park possesses an historical interest, having been the scene of a bloody action during the civil war between Urrea and Gandra.

The valley produces annually about 25,000 fanegas (65,600 bushels) of wheat; 10,000 fanegas (26,250 bushels) of maize, and about 5000 fanegas of other cereals. Vegetables are not cultivated to any considerable extent; onions, sweet potatoes, chili, and pumpkins constituting the entire supply. It is true there may be some others cultivated, but they are not common. Cacahuates (pea-nuts) are also raised here. Of fruits there is a great abundance, including grapes, melons, figs, oranges, limes, lemons, citron, peaches, and pomegranates. The figs are very fine; but the people do not know how to preserve them. The guava and plantain have lately been introduced, and are found to succeed. But the vine is most extensively cultivated; not less than 1500 barrels of brandy, of 125 cuartillos each, are annually made. Of the quantity of wine made I have no knowledge; but that it is superior to that of the Rio Grande there is no question. Cotton was formerly cultivated, and found to be of an excellent quality; but the plants became diseased, and it is not now raised to any extent. The sugar cane does not flourish here; nevertheless, the Ceris Indians of the Pueblo cultivate enough to supply themselves with *panoche* (sugar); and it has lately been tried near the coast with so much better success that it is believed it may yet be produced in a sufficient quantity to supply the State, if not for exportation. There is an extraordinary fertility in the bottomlands of Sonora; though I do not know that they sur-

pass in this respect similar lands in California, the products of which astonish the agricultural world. It is stated by Velasco, in his statistical account of Sonora, before alluded to, that the product of wheat at the hacienda of the Señores Astiaseranes of Horcasitas is from two hundred and fifty to three hundred to one; and that the haciendas at Tapahui, of which I have before given the details, are equally productive.

Hermosillo is a place of extensive business relations with all parts of the State, and has some large wholesale establishments for the sale of dry goods. There are scarcely any American goods sold here, though admitted to be of a superior quality. Yet I saw in the warehouses here, as well as in Ures, various cotton goods of British manufacture, bearing the stamp of the Blackstone and Lowell mills. French manufactures, too, are common. In fact, the entire market of Sonora seems to be supplied by England and France.

Some little is done here in the mechanic arts, more, indeed, than in any place we had yet visited. The working of leather is one of the most important branches of manufacture in the country. It is made up into saddle covers, leggins, and other articles, which are figured, inlaid, and embroidered with much taste and skill. A fine saddle cover, consisting of a piece of leather covering the entire saddle, and hanging down nearly to the stirrups, often costs a hundred dollars.

The old mission church still remains in good preservation, but its adornments are without much beauty or interest. A new one, at the opposite end of the town, that of *Nuestra Señora del Carmen*, is quite neat

and beautiful, both in its exterior and in its internal decorations.

January 1st, 1852. All the shops were open to-day, the same as on other days of the week. Several of the young gentlemen with whom I had become acquainted called on me this morning; and hearing me express a desire to take a sketch of the town, one of them procured a carriage and took me to the nearest elevation. I went to several parts of the town, but could not obtain a good view of the place and the picturesque scenery around it at the same time. I finally selected a spot facing the Sierra de la Campana, which gave a tolerable view of the town as a whole, and the rugged mountain at its side. The Alameda extends for a good distance along the front of the town, concealing, to a great extent, its finest houses. It is impossible to represent in one view any of those Mexican towns built upon plains, as they usually are. The streets being narrow, and compactly built, and the houses generally of one story, there is presented to the eye, when seen from an elevation, an unbroken mass of flat roofs, with few picturesque objects to break the monotony. Every town, it is true, has its church, which is crowned by towers and a dome. These I have always endeavored to introduce in my sketches.

In the evening I dined with my obliging friend Mr. Brodie, who cashed my draft on the government, thus enabling me to repay Governor Cubillas for his advances. He also procured for me both Mexican and American gold; so that I should not be troubled as to money in whatever territory I should find myself.

January 2d. Left Hermosillo at two, P. M., with Señor Don José de Aguilar and his brother, in a comfortable covered carriage, affording a good protection from the heat of the sun, which was very great. Pack mules and arrieros, with our baggage, and extra mules for the carriage, accompanied us. Soon after leaving, we met a party of one hundred and fifty Frenchmen, who were emigrating from California, and destined, as I afterwards learned, for Cocospera, with the design of establishing a colony there, as well as of working some mines. They were a rather hard-looking and determined set of men, with long beards and sunburnt faces. Each one carried a musket or rifle, besides which many had pistols.*

The country, after leaving the immediate vicinity of the river, is miserably poor. The road, however, is excellent; and though it has been travelled for two centuries without a day's labor being expended on it, it is still smooth, level, and hard, the soil being a fine gravel. No continuous range of mountains intervenes between here and the coast. Detached and short ranges of moderate elevation rise here and there, all of which are avoided. It may with more propriety be termed a desert plain than a mountainous region. No streams exist in the thirty-six or thirty-seven leagues between Hermosillo and Guaymas, and the only water to be found is procured from wells; hence there is no village or settlement on the route, and but few

* This is the same party which subsequently had a difficulty with the government, set the laws at defiance, and closed by taking possession for a while of Hermosillo. Their leader afterwards committed suicide.

ranchos. The following itinerary embraces all the ranchos along the road, which are the common stopping places for passing travellers and trains of merchandise :

Hermosillo to El Pozo (the well), a rancho,	7	leagues,
El Pozo to La Palma (the palm), a rancho,	6	“
La Palma to El Pozito (the little well),	4	“
El Pozito to La Cieneguita (little marsh),	4	“
La Cieneguita to Noche Buena (good night),	7	“
Noche Buena to La Palmita (little palm),	3	“
(now abandoned for want of water) ;		
La Palmita to Jesus Maria,	3	“
Jesus Maria to Guaymas,	3	“

—
37 leagues.

We halted at El Pozo, a well, with an ordinary rancho, being unable to proceed further, as our extra mules had not come up. At this place we made our supper with what we brought with us ; after which we spread our blankets within the walls of the rancho, and there passed a comfortable night. The transportation of goods between Guaymas and the interior, is almost entirely upon pack mules. We met many *atajos*, or trains, loaded with various sorts of merchandise, destined for the inland towns, or bound for the port with loads of flour.

January 3d. We had intended taking an early start, so as to finish the day's march early ; but the arrieros were slow, and in spite of all our efforts, we did not get off till after 8 o'clock, when the heat of the sun was already uncomfortable. The road was as good as yes-

terday, and the country as barren and uninteresting. The road sides were covered with various kinds of stunted trees and thorny shrubs, interspersed with numerous varieties of the larger kinds of cacti, some of which we had not before seen. Passed the ranchos of La Palma and El Pozito, and stopped at that of La Cieneguita for the night, fourteen leagues from our starting-place. The ranchos are ordinary farm houses of adobe, though pretty large. Each has a well, and supports more or less cattle and mules, according to the facilities for grazing and obtaining a supply of water. These establishments seem to be planted in the most forlorn-looking situations, where there is not a shade tree or a foot of cultivable ground. The whole business being the raising of cattle, their position is fixed solely with reference to grazing, which the cattle are said to find in plenty among the distant hills; though a passer along the road is at a loss to conceive where an animal can find wherewithal to sustain life. The cattle came up to the rancho for water, which is generally furnished from wells, and is raised by the bucket and sweep, or by the still more primitive apparatus of a raw-hide bag and rope, which is worked by hand, without the assistance of any mechanical power whatever.

Nothing could be obtained at these places but milk, and that only in the morning: I inquired for eggs and chickens in vain. Señor Aguilar, being well acquainted with the people from his frequent journeys between the two towns, was always well received and supplied with the best the rancho could furnish; yet tortillas and milk were all that could be got even under these circumstances.

The milch cows are managed by the women, and a peep into the corral at milking time would highly amuse our Yankee dairy people. The calves, being in an adjoining corral, are let in among the cows one or two at a time. These of course run for their mothers. The women then tie together the hinder legs of the cow thus designated, and while one holds a gourd shell, the other divides her time between drawing the milk and beating away the calf, which, not liking this appropriation of his breakfast, charges repeatedly upon the invaders and renders the process any thing but a quiet one. The cows are milked but once a day, and give not more than a quarter as much as our well-fed cows at each milking. Very little butter is made in the country, the milk being mostly manufactured into a sour and most indigestible article of the consistence of gutta percha, which is dignified with the name of cheese. Generally nothing is cultivated at these ranchos, the corn and flour consumed about them being brought from a distance.

January 4th. We did not get off any earlier than yesterday. Passed the rancho of Noche Buena without stopping. The next rancho, La Palmita, had been abandoned, its well having dried up. We had therefore to continue our journey to that of Jesus Maria, making altogether about thirty-nine miles. Here we watered. Soon after we arrived, my servant came in with the unpleasant news that my pack mule had given out at Noche Buena, and that it would be necessary to procure and send back a fresh one to bring in my baggage. A Mexican was immediately sent back with another animal; but as the distance was six leagues,

and it was already three o'clock, I feared that my baggage would not reach Guaymas till very late, if at all, that night. We now proceeded on our journey, the face of the country continuing as before described; and soon after we experienced the most delightful sensation of inhaling the fresh and balmy air from the ocean, to which we were now drawing near. None but those who, like myself, have spent a year and a half on the parched and barren wastes of the interior of our continent, or similar arid plains in Asia or Africa, can form any idea of the delight with which one first breathes the moist and invigorating ocean breeze.

A range of low mountains runs along the coast, the summit of which assume most fantastic shapes. The most conspicuous of these peaks are the *Tetas de Cabra* (Goats' teats), two elongated cones rising side by side. Passing this range, we came in sight of the great waters of the Gulf of California, and riding a few miles further, we entered Guaymas.

Wishing to avail myself of the first vessel to Mazatlan, I immediately visited Mr. J. A. Robinson, the U. S. Consul, to ascertain whether any were soon to sail for that port. Mr. R. informed me that he had a schooner which had just cleared, and then lay aground in the harbor; that she would probably get off with the rise of the tide, about 9 o'clock in the evening. I told him the situation of my baggage, when he kindly offered to detain his vessel till morning, if necessary. Mr. Robinson then invited me to his house to dine, an invitation which I accepted; after which he provided me with a room and bed, to which I soon retired, and

passed a most refreshing night after the fatigues of the day.

Guaymas stands on the eastern shore of the Gulf of California, in 28° north latitude, and $110^{\circ} 40'$ long. west of Greenwich. It is completely shut in from the sea as well as from the winds. Mountains protect it on the main, while islands with elevated hills surround it by sea. Next to Acapulco, it is the best port on the Mexican coast. The entrance from south to north is formed by the island of Pajaros on the east, and by the islands of San Vicente and Pitayas and the main land on the west. There is another entrance, called Boca Chica, from the south-east, having the island of Pajaros on the south and the shore of Cochori on the north, which terminates at the *Morro Ingles*, or English Hammock. From the principal mouth to the mole is about four miles, and the bay is of about the same extent. The bottom is so muddy, that ships which are obliged to remain some time, find it necessary to raise their anchors every week or so, to prevent their becoming too deeply imbedded to be extricated. The soundings commence with seven fathoms, and diminish gradually to two, at the side of the mole.

The bay abounds in fish of a great variety and delicacy; also with shrimps, crabs, lobsters, and oysters. But plentiful as these are, they are not easily purchased, and the market has no regular supply. The Yaqui Indians, who are the chief fishermen, after catching a lot, live and gamble upon the proceeds until the last *avo* (a small copper coin) is spent; when they are too often obliged to pawn their blankets for the means of hiring a boat to go and catch more.

The town stands close on the margin of the bay, occupying a narrow strip about a mile in length and not exceeding a quarter of a mile in width, when the mountains rise and hem it closely in. It is entered from the north by a single avenue, which forms its main street; and this is intersected by short lateral ones leading to the bay. The houses are built of stone, brick, and adobe. Those in the best parts of the town are plastered, which gives them a respectable appearance. There are several families of wealth here, whose houses are handsomely furnished, and who enjoy the luxuries of a residence near the coast. The streets are lighted at night, a convenience not noticed elsewhere. The place is supplied with water from wells in the suburbs, which is brought through the streets in leathern bags on the backs of donkeys. It is somewhat brackish, and at first unpleasant to the taste; but it is considered wholesome, and one soon becomes accustomed to it.* Below the town is the only neat cemetery we had seen in the country. The *Campo Santo* is generally a small inclosure in which bodies are allowed to moulder without any thing to mark the graves, the bones of former tenants being thrown out to make room for the new comers. Here are a number of neat monuments, and the ground is kept with some show of order. On the "feast of the dead" the bells toll day and night; and in the evening, the graves and monuments are surrounded with lighted candles, and visited

* For the facts relating to Guaymas and Hermosillo, not derived from personal observation during my brief stay in these places, I am indebted to Velasco's "*Noticias Estadísticas del Estado de Sonora.*"

by the friends of the departed. These kneel by the graves, while the priest, with a choir of singers, goes from one to the other, singing as many prayers for the souls of the departed as the survivors choose to pay for.

Although Guaymas has one of the finest ports in the world, and is a key to the interior of Sonora, it never enjoyed much trade until within a few years. The recent settlement of California, has doubtless given to its commerce a new impulse. Several ships and brigs were at anchor in the harbor, while others lay at the wharves; and the British steamer *Driver*, which is kept on the Pacific coast to facilitate and protect British commerce, makes monthly visits to this port. In 1845, there were exported from here only 8000 cargas of flour, of 300 pounds each. There are now many large and well filled warehouses of goods, such as would make a respectable appearance in one of our great commercial cities. Some of the retail dry-goods stores, too, are elegantly fitted up, and exhibit piles of the richest silks, satins, linens, and embroideries. I was shown by its owner through one of the largest establishments, and regretted that there was scarcely an article of American manufacture in the entire stock. Every thing was either English or French. I saw many articles which we can produce of equal or better quality, and quite as low; but it seems that our commerce has not yet found its way up the California Gulf. The market is so much better at San Francisco, that every thing rushes there.

As the soil in the vicinity is dry and stony, there are no gardens or cultivated spots in or near the town. Every thing comes from the interior. Maize, beans,

and vegetables are brought from San Antonio and Santa Rosa, about ten leagues distant; while from the Yaqui River are procured sheep, fowls, and some grains. Shut in as Guaymas is from the sea, and on every side encompassed by hills or mountains, the heat is intense. In the summer the mercury often rises to 104° Fahrenheit in the shade, and from June to September it is seldom below 96° . During this season, when the wind blows from the desert plains of the north, it is so dry and parched as to be almost intolerable, destroying furniture and every thing else of wood. Scarcely a soul is then seen in the streets, every one remaining quietly within doors, and passing his time with as little exertion as possible. The place was formerly considered healthy; but of late, it has suffered terribly from epidemics, one following the other, until the town, in the brief space of two years immediately preceding my visit, lost one third of its population. Cholera and bilious fevers have been the chief epidemics.

In order to ensure the arrival of my baggage, which had not yet made its appearance, and about which I began to feel much uneasiness, Mr. Robinson kindly sent his most trusty servant on a fast horse back to meet the arrieros, and hurry them forward. I was desirous, while the man was absent, to go back to the hills and take a sketch of the place, but was afraid to expose myself to the sun, besides not wishing to delay the vessel any longer, should my baggage happen to arrive. At half-past three o'clock, Mr. Robinson's messenger returned. He had actually ridden back nearly to Noche Buena, where my mule gave out, when he met the lazy arrieros smoking their cigarritos and

moving along at a snail's pace. They had been dozing away the morning, and, if left to their own devices, would not have arrived in two days.

After taking farewell of Mr. Robinson's family and my kind friend Señor Aguilar, to whom I shall ever feel under many obligations, I went on board the *Maria*, a mere pilot boat of fifty-seven tons burden, and we immediately put to sea with a fair wind.

CHAPTER XXI.

GUAYMAS TO SAN DIEGO, CALIFORNIA.

Voyage down the Gulf of California in a pilot boat—Barren coast—Island of Carmen—Loreto—Reach Mazatlan—Its picturesque appearance—Description of the town—Americans here—Embark for Acapulco—Land at San Blas—Visit to Mr. Horn, the Captain of the Port—Ride to the old town—Its beautiful position—Ruined condition—Visit an old fortress—Leave San Blas—Description of the coast—Volcanoes of Colima—Land at Manzanillo Bay—Its unhealthy climate—Laguna—Cargo discharged—Stupidity of Custom House official—Leave without papers—Reach Acapulco—Chinese hotel—Beautiful harbor—Castle of San Carlos—Unhealthiness of the place—Extreme heat—Noxious insects—Description of the town—Ancient commerce—Departure for San Diego—Crowded state of the steamer—Voyage up the coast—Arrival at San Diego—Rejoin the Boundary Commission.

January 6th. Our little vessel was much crowded with passengers, and I was compelled to put up with very uncomfortable accommodations. But my anxiety to reach San Diego, made me willingly submit to any inconveniences, not absolutely injurious to health, to accomplish my purpose. The wind was fresh from the north-west; and all the passengers, fourteen in number, were sick, except myself and an old voyager. I spent the day very pleasantly in reading some New-York papers kindly furnished me by Mr. Robinson. These were a delightful treat; for I had not heard from my family or the government, or seen an Ameri-

can paper for more than six months; and the latest intelligence I had had was of the date of May, 1851, or eight months previous.

January 7th. The north-west wind continuing, we made rapid headway under a close-reefed mainsail and foresail. Our little craft, which had seen rough weather in the harbor of New-York, scudded beautifully before the fresh breeze, half the time covered with water. The shores of the gulf were occasionally seen in the dim distance, rising abruptly from the sea, barren and desolate. In some places sandy beaches and desert plains intervened between the sea and the mountains. Saw the islands of Carmen and Catalina on our right. Behind the former lies the town of Loreto, the principal place on the Californian peninsula. As little has ever been written about this part of the world, I append a brief account of this town and its adjacent country, which will convey a correct idea of the peninsula.*

“Loreto stands in a valley of about two or three thousand feet wide, surrounded by wild and sterile mountains, of which that called “La Giganta” is the highest and least picturesque. There are two gardens in the place, in which the vine, peach, fig, quince, and date are cultivated. A considerable quantity of wine is annually made. Peaches and pears are dried as well as figs: the dates are preserved.

“The situation of Loreto being in a valley of very limited extent, in which there is only space for the town and two gardens, and there being no possibility

* Hardy's Travels in Mexico. London, 1829, p. 244.

of raising either wheat or maize, the inhabitants are obliged to depend upon Sonora almost for subsistence. Another circumstance renders the tenure upon which they exist very precarious. The hills which surround the town are chiefly composed of primitive rock, granite, and sandstone intermingled, with scarcely any soil upon them. They thus absorb but little moisture; and during the heavy rains, which happily do not occur more than once in five or six years, the rush of water through every part of the town, as it comes down the ravine, is so great, that instances have been known of some of the houses having been actually carried away.

“To prevent the occurrence of this danger, the former Franciscan friars, many years ago, erected a stone wall, to break the force of the water, and give it a new direction towards the sea. In successive years the rains washed this barrier away. Another was built, which shared the same fate; and at present there is but a slight trace that it ever existed.

The inhabitants of Loreto are of a dingy, opaque, olive green, which shows there is no friendly mixture in the blood of the Spaniard and the Indian. They appear to be the same squalid, flabby, mixed race, which is observed in almost every part of the Mexican coasts. The population does not exceed two hundred and fifty souls. The annual importation of corn from Sonora, is from 800 to 1000 fanegas. The exportations consist of soap, preserved fruits, wines, spirits, pearls, tortoise-shell and salt; the latter being obtained in a lake on the Island of Carmen.

January 8th. Our hopes of reaching Mazatlan to-

day, were frustrated by a calm. Our little craft was tossed about by the dead swell much more than when ploughing the waves in a gale. Our Mexican passengers called on San Antonio to send us a breeze, but he heeded not their invocations. We now stood in towards the shore, and thus caught the land breeze, which wafted us onward with speed.

January 9th. Came to anchor in the harbor of Mazatlan at 8 o'clock; soon after which, we were boarded by the captain of the port. This gentleman, after looking over the list of passengers, gave us permission to land. I lost no time, therefore, in making my way to the shore, accompanied by Colonel Moreno, of the Mexican army, who was a fellow passenger. This gentleman, who was educated in the United States, and speaks English like a native, was of great service to me, being well acquainted at all places on the coast. Besides, his position gives him influence wherever he goes. The Colonel took me to a hotel kept by a Chinaman, where we took rooms. The bill of fare here displayed would compare favorably with that of our American hotels, and the cooking was excellent. Noticing several Chinamen about, attending to menial duties, I inquired of the landlord, if his cook was a countryman of his; but was told in reply that he was a German, to whom he said he paid \$40 a month, which, in his estimation, was a very high price. The area or inclosure of the hotel had been converted into a cock-pit, in which were some thirty or forty game cocks, each fastened by the leg to a small stake. It was well fitted up and protected by an awning.

Mazatlan has a very picturesque appearance, whe-

ther approached from the sea, or by land. On the north side of the bay or roadstead is a long neck, or narrow range of rocky and fantastic looking hills, their sides exhibiting projecting crags and deep indentations, which the ocean has been lashing for ages. The extreme end of this promontory, which it should more properly be termed, is higher than the other portion, and of a sugar-loaf form. Beneath these hills on the verge of the sea, the houses are thickly crowded together. But the best portion of the town lies on more level ground, and directly facing the roadstead. On the south are rocky islands defending the harbor in that direction; but there is no protection from the west and south-west. Here the harbor is open to the broad Pacific; and when the wind is from that quarter, the sea rolls in with great force, from which ships can find no security. Serious disasters have happened here during south-westerly gales.

The town contains from ten to twelve thousand inhabitants. Its streets, though narrow, are well laid out, and lined with large and well built houses. More taste and luxury are looked for in commercial towns than in those of the interior, and accordingly we found Mazatlan to be considerably in advance of any town we had yet seen. The houses are more substantial and elegant, though unfortunately, in consequence of its narrow streets, they show but to little advantage. The style is wholly that of the old Castilian, with short columns, Moorish capitals, and ornaments. Many houses present long lines of colonnades. There are many fine and well filled shops. Those containing drygoods are neatly fitted up; and, in the richness of their goods,

vie with the fashionable stores of New York. The Spanish ladies are fond of dress ; and I have no doubt the manufacturers of Lyons sell as rich silks in Mexico as they do in Paris or London.

In the afternoon I walked out to the suburbs for the purpose of making the accompanying sketch. I chose for my site an old burial place. In the foreground, are a number of small houses built of sticks and adobe, with pointed roofs, thatched with palm leaves. In the middle of the picture, less distinct, is the best portion of the town ; while the harbor and northern promontory are seen beyond.

I found a number of Americans here, some of whom had been waiting a month for a steamer for San Francisco. Three days before my arrival, the regular mail steamer reached the offing, and sent a boat on shore for the mail, but refused to receive any passengers, on the ground that she was full. These people were greatly disappointed, and complained bitterly. Many had expended their last cent, and were now in great distress.

Jannary 10th. Called on Mr. Gatton, the U. S. Consul, who received me kindly and extended many civilities to me. Mr. G., who is from Virginia, informed me that the income of his office was five hundred dollars less than his expenses. Board, office rent, postages, &c., were very high. He remained solely for the benefit of his health.

As the chances were against my getting a steamer for San Diego, I was advised to take a sailing vessel for Acapulco. At that place all the Californian steamers stop for coal ; and as they arrive every week, I should

not, at the farthest, be detained many days. To take a sailing vessel direct for San Diego or San Francisco, would require a voyage at this season, when north-westerly winds prevail, of thirty or forty days. I therefore determined to make the long voyage of some six hundred miles directly out of my way, as the quickest route to my place of destination, and at once inquired for a vessel. Fortunately for me, there was one to leave in the evening, and I lost no time in securing a passage.

Early in the evening I went to the place of embarkation on the beach ; from which, as the tide was low, each passenger had to be taken in the arms of the Mexican boatmen, some forty or fifty yards to the boat. The vessel was more than a mile from the shore, and we were not a little puzzled how to find her among the number that lay in the offing. After much inquiry, however, we succeeded. Her name was the Miguel ; and, though sailing under the Mexican flag, she was commanded by Captain Nye, a very clever navigator, hailing from New Bedford, Massachusetts.

Knowing the thievish propensities of the lower class of Mexicans, I directed my servant to keep a sharp look out for my baggage, while I stepped to the cabin to secure a berth. Soon after he was ordered to bring me my desk ; and though absent less than a minute, he found on his return, that the boat which had brought us had pushed off, and a portion of my baggage was gone. The moment my servant had left them, they took what they could lay their hands on, jumped into their boat, and disappeared in the dark. Pursuit was useless. The articles lost were not of much value ; but

it was provoking, notwithstanding all my care, to be robbed by this rascally people wherever I went. While speaking of my misfortune, one of the passengers said his silk handkerchief had been taken from his coat pocket by the man who brought him in his arms to the boat. Two other passengers, on examining their pockets, found that they had sustained a similar loss. I could not help laughing, informing them that I had taken the precaution to secure a fine silk handkerchief I had just bought, by putting a couple of oranges in my pocket above it. "You had better look," said my friends, "and see what your precautions amount to." I did so, and found I had been operated upon as effectually as the rest.

January 11th—13th. These days were spent at sea, bound for San Blas, distance one hundred and twenty miles. We had expected to reach there in one day, but were retarded by light winds and calms. No incident occurred worthy of notice. We had some ten or twelve passengers, all Mexicans but three. Of these, one was a German, Mr. Mejer, a merchant of Colima, Mr. Augustus Harcourt,* a Scotchman, and myself. Mr. Harcourt had just arrived at Mazatlan from El Paso del Norte, by way of the city of Chihuahua, and gave me information from that place to a late date.

January 14th. This morning we entered the har-

* This Mr. Harcourt was the same person who was formerly connected with the United States Quarter-master's office at Santa Fé, New Mexico, where he was guilty of some irregularities, such as placing the name of the Quarter-master to drafts on the government, to the serious loss of sundry merchants who cashed them, as well as to the Quarter-master himself.

bor of San Blas, at seven o'clock, and before we came to anchor were boarded by Mr. Horn, the captain of the port. Had that officer been a Mexican, he would not have visited us in an hour. All the passengers but three left us here.

Went on shore at ten o'clock, and met a fellow passenger coming out to our ship to invite me to breakfast with Mr. Horn at twelve o'clock. I accepted the invitation, and soon after paid my respects to this gentlemanly and accomplished officer. Mr. H. is by birth a Swede, and is married to a Mexican lady. Both are quite young. Their house is built of poles, after the manner of the country; the intermediate spaces are filled up with mud, which is plastered and white-washed. The foundation is of stone, very thick, and rising about three feet above ground. On this rest the poles. These support a very tall and pointed roof of the same material, covered with cocoa-nut leaves and grass, closely bound together, so as to be impervious to water. The whole is open from the floor to the apex of the roof. This species of roof and thatching is universally adopted here, as well as at other places on the coast; and by giving a large space for the free circulation of air, it renders the house cool and comfortable. Mr. Horn's house is elegantly fitted up with well selected engravings, a variety of books in the Swedish, English, French, and Spanish languages, and furniture adapted to the climate. I have nowhere seen more taste and better arrangements for comfort in a hot climate than here.

After a sumptuous breakfast, Mr. Horn ordered three horses to the door, and accompanied Captain

Nye and myself to the old town of San Blas, three quarters of a mile distant, on the summit of an isolated rock from one hundred and fifty to two hundred feet high. This rock, which rises abruptly from a low, swampy, and partly wooded plain, is inaccessible on three sides. The northern side, where we ascended, has been cut away; and a winding path, of easy ascent, leads to the top. This road is closely lined with a dense forest of cocoa, banana, plantain, and other tropical trees, together with a thick undergrowth of flowering plants and vines, which are closely bound together, and prevent all ingress. The bold, rocky mass presents a most picturesque appearance. Portions of it exhibit a bare perpendicular front, while others are covered with a most luxuriant vegetation. The summit, which is about five hundred yards square, was formerly occupied by the town; but, owing to the unhealthiness of the situation, it has been deserted and suffered to fall to decay. The business of the town has long been transacted at the *Playa*, or shore, where we landed; but the custom-house has lately been removed to the spacious and commodious buildings on the rock, and the ruined tenements around seem about to become the abodes of men once more.

On reaching the summit of the rock, one first enters a large and elegant building of stone, with a colonnade around its inner side, and stuccoed with a snowy-white cement. On the outer side is a redoubt, built on the very verge of the rock, which is here perpendicular. Cannon of large calibre are arranged in the ports. This building, which seems to have been abandoned for a long time, is now undergoing repairs,

and is used as a public warehouse, and for offices of the customs.

At the other end of the rock is a fine old church, built of dark gray stone, with some six or eight bells suspended in its ruined towers. The roof of the edifice has fallen in, and nothing now remains but its bare walls, which, owing to the solid manner in which they were built, are in good preservation. In front of the church is the plaza, which is completely inclosed by substantial stone buildings, some with tasty colonnades. Many of these buildings are in good preservation, while others are in a more or less ruined state. I noticed that some were undergoing repairs.

The custom-house was for many years at Tepic, twenty-five miles distant, of which San Blas is the port. It remained there on account of the unhealthiness of San Blas, which in former years suffered greatly from epidemics. The plain of which I have spoken is often under water; and the exhalations from it cause malignant fevers, besides giving birth to myriads of mosquitoes and sand-flies. During the rainy season, from June to November, the place is uninhabitable, owing to the torrents of rain, which destroy the houses, and perfectly insulate the rock. San Blas affords meat, various kinds of fruit, and vegetables, of which our captain laid in a supply. A stream comes in at the plaza, which affords a good boat harbor; but outside, ships are obliged to anchor in the open roadstead, where they are exposed to westerly gales.

Returning from this beautiful spot, Mr. Horn placed at my disposal the government barge, for the purpose of crossing the bay to an old ruined fort, from which

I wished to take a view of the town. There had been a large fortress here, with bastions; but it was now, and seemed long to have been, in a ruinous condition. Cannon of large calibre lay near the ports, where they were originally placed, just discoverable beneath the dense shrubbery and weeds which filled the inclosure. Their heavy carriages had entirely rotted away. I seated myself on an old gun, but had no sooner commenced my sketch than I was enveloped with a cloud of sand-flies and mosquitoes. In vain did I endeavor to beat them off, my friends lending me their assistance. My face, hands, and paper were literally covered with the pests. I submitted with as good a grace as I could, until the smarting pain of their bite compelled me to relinquish my task without obtaining the object for which I came. I returned to the house of my courteous friend, with whom I took tea, and at ten o'clock returned to the ship. The present population of San Blas is two thousand.

January 15th. At sea, having sailed during the night. Found our brig far more comfortable, in consequence of the reduced number of passengers.

January 17th. At sea, with a light wind off shore. In the afternoon found ourselves off the volcanoes of Colima, bearing east. Near the shore was a large and remarkably white rock, rising abruptly from the sea as high as the mast head. By this our captain was enabled to find the opening to the bay of Manzanillo, to which place we were now destined. There is a great uniformity in the thousand miles of Pacific coast which I have traced. A chain of mountains extends the entire length, and often rises abruptly from the shore. Even

when a few miles intervene between it and the coast, the appearance from the sea is the same. Hence the openings of the various ports and harbors are difficult to detect, except where some bold promontory juts out into the ocean, or some island or rock is found near. The opening of Manzanillo Bay would not be observed by a passing vessel. But the bearings of the volcanoes, two well defined and lofty peaks, some forty miles in the interior, and the rocky island alluded to, conduct the mariner to the spot. We reached the entrance just at dusk; but as there was no chart of the bay, and several bold rocks showed themselves, the captain thought it prudent to stand off till morning.

January 18th. The morning found us becalmed some ten miles from shore. This was provoking, but there was no help. Fortunately in the afternoon a light breeze sprang up, and at five o'clock we came to anchor in the Bay of Manzanillo.

January 19th. The custom-house officer would not permit the cargo to be discharged until the ship's papers were sent to Colima, where the collector resides. When this was intimated last evening to Mr. Mejer, the owner, he procured mules and set off at once to attend to the matter personally. Colima lies on the opposite side of a low range of mountains which cannot be crossed; so that though but thirty miles distant in a direct line, it is between ninety and a hundred by the mule path, which is the only route to it. The day was exceedingly hot, so that I did not leave the vessel.

January 20th. To-day, although it continued very hot, I went on shore; the place consists of some twenty

houses built of poles, with high pointed roofs, and thatched with cocoa and plantain leaves. These houses are ranged in a line along the beach, and are occupied by a cadaverous-looking people, who seem to have scarcely energy enough left to keep body and soul together. Found a German here, the commercial agent of Mr. Mejer, who spoke English well. I saw also two custom-house officials, who appear to be gentlemanly men. Beside these three, the whole population consists of the lowest class.

The Bay of Manzanillo, though little known, is one of the finest on the coast, being equally well protected against all winds. The place has no direct trade, and is merely resorted to as the port of Colima, which can be approached from the sea only through this bay. There is no arable land near save small garden spots about the houses, the hills rising directly from the sea and from the bay. Hence its admirable harbor, which is far superior to those of San Blas and Mazatlan, cannot be taken advantage of. Within a quarter of a mile is a lagoon and morass about two miles in width, and sixty miles in length. During the dry season this lagoon becomes nearly empty of water, when a pestilential effluvia arises which renders it extremely dangerous to all who live on the bay, and even to the crews of the ships which stop there. This, of course, will prevent any considerable settlement from ever being made here. Instances have occurred where every soul on board a ship has been taken sick and half of them have died, while stopping here a few days to discharge a cargo. My German friend cautioned me not to eat any fruit while here, even an orange, and to avoid the

night air. The plantains, bananas, and oranges laid in by me at San Blas, have therefore been put aside to rot or be thrown overboard. The cheapness of these fruits on this coast is such, that a single dollar will buy enough for a voyage to San Francisco, allowing for a daily supply as much as one could eat.

Manzanillo Bay.

January 21st. A courier arrived very unexpectedly from Colima, with the ship's papers and permission to discharge the cargo. This news was received with much joy. A lighter was soon alongside, with a host of half-naked Mexicans, and all hands at once set to work.

This morning I took my gun and returned to the laguna, to see if there was any game. I found a log canoe, and coasted along its banks for a mile or more.

There was a great abundance of ducks, pelicans, cranes, and other water fowl; but I was so much exposed, that I could not get a shot. I now landed to try my chance from among the mangrove trees and jungle which grew on the banks. But here the difficulty of walking was so great, that it was at the hazard of my life that I attempted to penetrate the thicket; and I was glad to get out as quick as possible, reach the higher and dry ground, and retrace my way to the village. Besides I felt that there was some danger in exposing myself in so unhealthy a spot during the intense heat of noonday. This laguna had a most enchanting appearance. The exuberance of the numerous tropical plants which grew upon its shores, with the hills rising on every side, made it seem like a vast amphitheatre.

I noticed on the rugged hills at the entrance of the bay a number of the *petahaya*, or giant cereus, differing from the specimens of that remarkable plant which I had seen in Sonora, and which I therefore supposed to be another variety. These grew to about twenty or twenty-five feet in height, and had numerous and more slender branches. The rocks were so steep, and so thickly covered with cacti and dense shrubbery, that I made no attempt to approach nearer than to take a sketch of a perfect specimen, of which I had a fine view.

January 22d. Towards evening when the sun had got behind the hills, I went to some rocks at the end of the village and took a sketch. The cargo having now all been taken out, the captain went on shore for his papers, leaving orders to get the vessel ready for sea, when another difficulty occurred. The officer affirmed

that the papers required the signature of the "Captain of the Port," who was at Colima, and positively refused to give them or sign them himself. A messenger was accordingly dispatched to that place again, and ordered to ride all night. A strong fair wind which was now blowing made this unexpected delay the more annoying; but we had no alternative and must quietly submit.

This Colima, which so long detained us, is the capital of a small state of the same name. It is said to contain 30,000 inhabitants, or half the population of the State. The city is remarkable in a historical point of view, having been founded by the "Great Captain" or conqueror of Mexico, Cortez himself, between the years 1522 and 1524, after his return from Spain. The town of Zacatula, twenty-five leagues to the south on the coast, was also founded by Cortez. This is a place of little importance, containing only about two thousand inhabitants.

January 25th. In the afternoon the messenger returned from Colima, bringing the papers for which we had been detained. The captain went on shore to get them, when it appeared that the stupid officer, by mistake had sent the passenger roll instead of the manifest and clearance papers to the collector. He was for dispatching the messenger again with the proper papers; but the patience of Captain Nye, as well as of the passengers, was now exhausted, and the captain declared that he would dance attendance no longer. We had been here a week, when a single day would have sufficed to discharge the portion of the cargo that was to be left at the place. The captain returned at once to the ship, and soon after got under weigh.

January 31st. Our voyage of six days had been attended with no incident. Calms and light winds prevailed, while the heat was extreme. The coast was mountainous and barren, presenting the same general features as before described. At 4 o'clock, P. M., we reached Acapulco. I lost no time in getting on shore; and instead of being attracted to a public house styled the American Hotel, where I saw large numbers of my countrymen, I went with my fellow-passenger to the Canton Hotel, kept by Quanahu, a native Chinese. This was the very perfection of neatness. The house, like all others in the place, was of a single story, with a large court in the centre. The floors and courts were all laid with brick or cement, and the walls were either colored or whitewashed. The landlord had long lived on the coast, and spoke Spanish well. Of English he knew nothing. His attendants, who were all Chinese, wore their native costume. Mr. Quanahu, like most foreigners who settle in the country, had taken to himself a Mexican wife, a genteel pretty-looking woman. During the evening, this lady, with a number of her young female friends, took their seats at one of the refreshment tables, and seemed to enjoy themselves mightily over their wine, cakes, ice-cream, and dulces; while Mr. Quanahu and his Chinese waiters supplied their wants as carefully as those of any of his guests.

February 1st. Acapulco has one of the finest harbors in the world. It is perfectly land-locked, and may be entered with ease by two passes. The most direct is by the *Boca Chica*, between the points of Pilar and Grifo, and is from 250 to 280 yards in width. The other is between the Isla de la Roqueta and the Pun-

ta de la Bruxa, a mile and a half in width. The hills which encompass the bay, rise abruptly; hence the water is very deep, and ships of the largest burden may approach within a few yards of the shore. A thousand vessels might lie within the harbor, and be amply protected against any wind. A stranger approaching the town by land, except just opposite the entrance, would imagine that he saw before him a placid mountain lake, rather than an arm of the sea. So completely inclosed is the town with high hills immediately behind it, that it enjoys little benefit from its proximity to the sea. On the western side, the bay is separated from the ocean by a narrow isthmus, about four hundred yards in width, where, it is said, nature intended forming a third entrance, but this has never been accomplished. One of the enterprising governors of Acapulco conceiving the idea of completing what nature had begun, actually caused an opening to be made through the mountain, which, as it answers the purpose of admitting the air, is acknowledged to be of essential service. This opening is called "*L'Abra de San Nicolas*."

At the extreme point of the town commanding the entrance to the bay, is the Castle of San Carlos, a formidable looking fortress. It is built of large blocks of stone, and is surrounded by a deep trench redoubt, but, like every thing else in the country, is much out of repair. The walls have been rent in several places from top to bottom by earthquakes; and where large portions had fallen entirely, the stones had simply been piled up again. Around this fortification I saw hundreds of well dressed people taking an afternoon walk,

Baye la Bruja, a mile and a half in width. The hills which encompass the bay, rise abruptly; hence the water is very deep, and ships of the largest burden may approach within a few yards of the shore. A thousand vessels might lie within the harbor, and be amply protected against any wind. A stranger approaching the town by land, except just opposite the entrance, would imagine that he saw before him a placid mountain lake, rather than an arm of the sea. So completely enclosed is the town with high hills immediately behind it, that it enjoys little benefit from its proximity to the sea. On the western side, the bay is separated from the ocean by a narrow isthmus, about four hundred yards in width, where, it is said, nature intended forming a third entrance, but this has never been accomplished. One of the enterprising governors of Acapulco conceiving the idea of completing what nature had begun, actually caused an opening to be made through the mountain, which, as it answers the purpose of admitting the air, is acknowledged to be of essential service. This opening is called "*L'Abra de San Nicolas*."

At the extreme point of the town commanding the entrance to the bay, is the Castle of San Carlos, a formidable looking fortress. It is built of large blocks of stone, and is surrounded by a deep trench redoubt, but like every thing else in the country, is much out of repair. The walls have been rent in several places from top to bottom by earthquakes; and where large portions had fallen entirely, the stones had simply been piled up again. Around this fortification I saw hundreds of well dressed people taking an afternoon walk,

to enjoy the fresh sea air which a westerly breeze brought in. East of this, a bay makes up, and adjoining it is a marsh, where large numbers of small fish are left; these, becoming putrid under a tropical sun, help to engender the fevers which at certain seasons prevail here. Bilious cholera morbus is also common; and the Mexicans from the interior, as well as the numerous Americans who now stop here on their way to California, fall victims to these diseases. But these are not all the troubles of the Acapulcans: earthquakes and hurricanes often occur; the dry and burning atmosphere is almost insupportable; while noxious insects and reptiles infest dwellings or assail the inhabitants wherever they go. Baron Humboldt, who spent some time at Acapulco, and who has investigated the climatic influences of tropical America more than any other writer, does not hesitate to give his opinion, as the result of a comparison, that "the heat is more oppressive, the air more stagnant, and the existence of man more painful at Acapulco, than at Vera Cruz."*

The town stands on a narrow strip of land less than half a mile in width, on which there is but little soil. The houses are built of stone as well as of adobe, and covered with red tiles. Those of the better class, are whitewashed, and have a neat appearance; many have little niches in their walls, in which is placed a crucifix or image, in honor of some saint. I noticed many houses in a state of dilapidation: there is also an old ruined church, its walls and tower still standing, which is said to have been destroyed by an earthquake. A

* Political Essay on New Spain. Vol. IV. p. 145.

new and much finer edifice has since been built. In the skirts of the town, and partly on the mountain's side, is a class of houses built of poles, and having high pointed roofs thatched with palm and cocoa-nut leaves, that there may be a freer circulation of air; some of them are not inclosed, a few posts supporting the roof. It was near one of these primitive dwellings, a little elevated above the town, that I selected a spot from which to take a sketch of the place. I had here a good view of the whole town, its fine harbor, and the Castle of San Carlos, in the distance. A rank tropical vegetation concealed a considerable portion of the town, and extended nearly to the water's edge; among the varied foliage, the graceful cocoa-nut tree is most prominent; the palm, plantain, and banana, too, are thickly dispersed throughout it.

The market is open every morning from daylight until ten o'clock, in a corner of the Plaza. Fruits and vegetables of every variety are spread out; and the numerous passengers from the Californian steamers, usually rush to the market to lay in a stock of the delicious fruits there offered for sale. Change being scarce, small cakes of soap are used instead, as in other parts of Mexico.

It is surprising that this town has not become modernized, by the immense number of Americans and others, who stop here on their way to California. Every steamer remains for a couple of days to take in coal, when the passengers generally land and endeavor to spend some of their money, few as are the inducements to do so. There are a number of hotels, one of which, called the American, is kept by a German, and is any

thing but what its name imports, both in appearance and the character of its company. The name attracts thousands, although the house kept by the Chinaman, called the Canton Hotel, is altogether superior in accommodations. One reason why the place does not improve, is, that no encouragement is given to foreigners to settle here, but quite the contrary. The government is jealous of them; and from what I heard and saw of the conduct of my countrymen, I fear it had too good cause to be so.

Acapulco owed its former importance to its commerce with the East Indies through the Phillippine Islands. This commerce was limited to a single ship of large burden, whose cargo was estimated to be worth from £300,000 to £400,000 sterling. When the news reached Mexico that she was off the coast, the merchants crowded to Acapulco from all parts. The exports from Mexico consisted of silver, cochineal, cocoa, wine, oil, and Spanish wool. The imports were chiefly China silks, India muslins and cottons, spices and aromatics, jewelry, and other articles of luxury and taste.

February 2d. The mail steamer "Oregon" and the propeller "Monumental City" arrived this morning from Panama for San Francisco. The former had four hundred and seventy-two passengers, the latter four hundred and fifty. After examining the latter, and finding her very crowded and filthy, I took a boat and boarded the Oregon. She too was crowded, but was clean and in excellent order. Captain Pierson, on my stating to him my position as a government officer charged with important duties, consented to take me,

if I would put up with such accommodations as he had to offer. Every place was filled, even to the tables and floors of the cabins. The decks, too, had been monopolized; and the only place he could give me to sleep in was a hammock suspended in the rigging eight or ten feet above the deck. As the weather was exceedingly hot, I gladly accepted the accommodation. Returning to the shore, I hastily packed up my luggage, and was again on board the steamer at 3 o'clock p. m. At four we put to sea with a light wind.

February 3d-8th. At sea. Moderate winds from the north, continued during these six days. When off Cape St. Lucas, the weather suddenly changed, becoming so cool that I was obliged to give up my aerial sleeping place. By close stowing, room was made for me on the floor of the lower cabin, where I remained the rest of the voyage. I was also obliged to change all my clothing, and substitute thick flannels and an overcoat; notwithstanding which, I had an attack of fever and ague. There was a good deal of sickness on board, chiefly fevers. Some had contracted disease from exposure when crossing the Isthmus of Panama, others by imprudence in eating fruit. A passenger from Cornwall, England, died and was launched into the sea, the burial service being first read by a Methodist minister. Passed a whaleman, the ship Carlton from New Bedford, sixteen months out. She sent her boat to us with a present of a large turtle, and requested some newspapers in return. A lot was accordingly contributed by the passengers, and sent to her. This is considered a good whaling ground, and we noticed many of these monsters of the deep sporting around us.

The character of the coast, whenever we were near enough to see it, was much the same as that from Mazatlan to Acapulco. Barren and rugged mountains rose abruptly from the sea, exhibiting a most dreary and forbidding aspect.

February 9th. We entered the bay of San Diego last night, about 11 o'clock. I was landed by a boat at the Playa, and took lodgings at a small house near the beach. This place is situated just within Point Loma, and is about a mile from the sea. The steamers merely run in and leave the mail. Sometimes they are obliged to take in a supply of coal to enable them to reach San Francisco, still nearly six hundred miles distant. I had now made a sea voyage of 1300 miles from Guaymas to Acapulco, and of 2000 miles from the latter place to San Diego. The first trip occupied twenty-six days including stops; the latter but five days.

After breakfast I procured a wagon to take me and my baggage to the town of San Diego, five miles up the bay. Here I learned that the surveying parties from the Gila had preceded me, and were three miles farther up at a small settlement. Continuing my ride, I reached the village at 10 o'clock, where I was first met by my excellent friend Colonel Craig, commander of our escort. He informed me that they had felt much anxiety on my account, as nothing had been heard from me after I left Santa Cruz about the 1st October; and fears were entertained that we had all been cut off by the Indians. No word had been heard from Dr. Webb and his party, which left me at Ures on the 16th December. The parties under Mr. Gray and Lieutenant Whipple had arrived on the 10th of January.

They were compelled to suspend the survey of the Gila about sixty miles from its mouth, in consequence of shortness of provisions. They then hurried through to the Colorado, and thence across the desert to San Diego. All were in good health, though they had suffered some hardships like the rest of us. Thomas Harper, one of Lieutenant Whipple's party, was drowned in the Colorado.

FIFTH DIVISION.

SAN DIEGO TO EL PASO, ALONG THE GILA.

CHAPTER XXVI.

SAN DIEGO TO ALAMO MUCHO.

PAGE

Preparations for the journey to El Paso—Leave San Diego—Accident to wagon—Snook's rancho—San Pasqual—Gen. Kearney's battle at this place—Indian village—San Pasqual mountain—Difficult ascent—Reach camp at Santa Isabel—Deficiency of transportation—Leroux despatched for another wagon—Indians of Santa Isabel—A Mormon arrives with a wagon—List of return party—Journey resumed—Luxuriant valley—San Felipe—Indians—Their mode of life—Narrow mountain pass—Vallecita—Desert appearance—Carrizo creek—Increased barrenness—Intense heat—Mules run away—Skeletons and carcasses of animals—Immense destruction of sheep—Utter desolation—Wagon upset—Sacket's well—Dig for water—Meet Lieut. Sweeney in pursuit of deserters from Fort Yuma—Arrival of bearer of despatches—Alamo Mucho. . . 109

CHAPTER XXVII.

ALAMO MUCHO TO FORT YUMA.

The Desert—Dry basin—"New River"—Alarming news from the Train—Colonel Craig's encounter with the deserters from Fort Yuma—Report of Sergeant Quin—Dr. Webb returns in search of Colonel Craig and Sergeant Bale—Loss of wagons on the desert—Great heat—Return of party with the body of Colonel Craig—Sergeant Bale's return—Further particulars of the encounter with the deserters—Burial of Colonel Craig Word sent to San Diego—Prompt action of Colonel Magruder—Arrest of the murderers by Indians, and their execution—Colonel Craig's character and services—March resumed—Cooke's well—Colorado river—Banks washed away—A passage cut through the woods—Arrival at Fort Yuma—Depredations by the Yuma Indians on the camp at night—Unsuccessful pursuit—Lieut. Whipple commences crossing the Colorado. 133

CHAPTER XXVIII.

FORT YUMA AND THE ADJACENT COUNTRY.

	PAGE
Crossing of the Colorado continued—Description of Fort Yuma—The Colorado and Gila rivers—The adjacent country—Rich alluvial bottoms—Facility of irrigation—Ruins of the old Spanish Missions—Difficulty of supplying Fort Yuma—Plan for surveying the head waters of the Gulf of California—Frustrated by Colonel Graham—Discovery of the Colorado in 1540 by Alarchon—Later voyages—Difficulties in navigating the Colorado—Attempt of a steamer to ascend the river—Its velocity and height—Fort Defiance—Massacre of Dr. Langdon and his party by the Yumas—Indians of the Colorado—Early tribes not identified—The Yumas—Cocopas—Mohavis—Extent of Alarchon's voyage in 1542—Fathers Kino, Font, and Garces.	156

CHAPTER XXIX.

FORT YUMA TO THE COCO-MARICOPA VILLAGES.

Leave Fort Yuma—Absence of grass along the Gila—Petahaya or Giant Cereus—Gila trout—Meet the surveying party—Inscribed rocks—Excessive heat—Night marches—Wagons found—How <i>caches</i> are made—Particulars of the murder of Mr. Oatman and his wife—Basin of the Gila—More sculptured rocks—Cross the Jornada—Great bend of the river—Another desert—Toilsome march—Reach the Coco-Maricopa villages.	185
--	-----

CHAPTER XXX.

THE COCO-MARICOPA AND THE PIMO INDIANS.

Visit from the Coco-Maricopa Indians—Camp removed to the banks of the Gila—The river dry, and no grass—War party—Return to our first camp—Traffic with these Indians—Farther accounts of the Oatman family—Francisco, the Maricopa interpreter—Feeding the tribe—Visit from the Pimos—Religious notions of these tribes—Their manners and customs—Agriculture—Art of spinning and weaving—Manufactures of cotton—Pottery—Basket-work—Dress—Their attempts at collecting zoological specimens—Villages—Houses and mode of building—Store houses—Horses and cattle.	213
---	-----

CHAPTER XXXI.

AT THE COCO-MARICOPA AND PIMO VILLAGES.

	PAGE
Journey to the river Salinas—Its rich bottom-lands—Large stream—Pimo Indians—Ruined buildings—Mounds—Broken pottery—Traces of irrigating canals—Ancient population probably large—Return towards the Pimo villages—Are taken for Apaches—Arrival at camp—Arrival of Lieutenant Whipple—Survey of the Gila completed—Trade reopened with the Coco-Maricopas—Presents—Tribe of Cawenas—Remove to the Pimo villages—Cola Azul and the Pimos—Traffic with them—Conference—Giving presents—Arrival of Mexican traders—Return of Lieutenant Paige with the escort—Leave the villages. . .	239

CHAPTER XXXII.

INDIANS OF THE GILA, AND THE CASAS GRANDES.

History of the Coco-Maricopas and Pimos—Origin of their semi-civilization—Difference of languages—Their number—Physical peculiarities—Deserving the attention of Christians and philanthropists—Early accounts of these Indians—First described by Father Kino in 1697—Sedelmayer's visit to them in 1744—Father Font's in 1775—Visit to the Casas Grandes of the Gila—Description of these ruins—Evidences of a former large population—Irrigating canals—Broken pottery—Father Font's description of these buildings—Singular error in relation to their dimensions—Kino and Mangi's visit to them in 1694—Notion of the Aztec origin of these buildings not well founded—Excessive heat. . .	261
---	-----

CHAPTER XXXIII.

CASAS GRANDES TO SANTA CRUZ.

Leave the Gila—Terrific storm on the desert—Encounter a party of Americans at midnight—Stopped by the darkness—Unpleasant situation—Pack mules and cattle missing—Picacho mountain—Vegetation of the desert—Second night's march—Arrival at Tucson—General Blanco—Arrival of Mexican troops—Campaign against the Apaches—Meet Mr. Coons with 14,000 sheep—His disasters—Visit from General Blanco

	PAGE
and his officers—Repairs on wagons—Tucson and its valley—Meteorite San Xavier del Bac—Beautiful church—Spanish and Anglo-Saxon colonization—Incessant rains—Presidio of Tubac—Meet Inez Gonzales the captive girl—Her sad fate—Uncertainty of irrigated lands—California emigrants—Calabasa—Picturesque valley—Tumacacori—San Lazaro—More emigrants—Reach Santa Cruz	285

CHAPTER XXXIV.

SANTA CRUZ TO THE PRESIDIO OF JANOS.

Shoeing mules and repairing wagons at Santa Cruz—Standing guard—Sad fate of Inez Gonzales—Sickness of the town—Boldness of the Apaches and their constant inroads—Wretched state of the people—Leave Santa Cruz—Country assumes a new aspect—Rio San Pedro—Enter the mountains—Agua Prieta—Prepare for a fight—False alarm—Meet Colonel Garcia with Mexican troops—Enter Guadalupe Pass—Wagon upset—Description of the country—A better route suggested—Take the Janos road—More emigrants and their encounter with a bear—Two human bodies found—Open country—Reach Janos.	314
---	-----

CHAPTER XXXV.

JANOS TO CORRELITOS, AND VISIT TO CASAS GRANDES.

Janos, an old military post—Its decline—Aid a party of American emigrants—A Thomsonian doctor—Difficulty in fording the Casas Grandes river—Arrival at Correlitos—Smelting works—Unhealthiness of the people—Barranca Colorado—Visit to the town of Casas Grandes—Extensive ruins—Resemblance to those on the Gila—Fertile valley—The river and its tributaries—Modern town—Return to Correlitos.	339
---	-----

CHAPTER XXXVI.

CORRELITOS TO EL PASO.

Leave Correlitos—Visit the silver mines of Messrs. Flotte and Zuloaga—Attempt of a peon to escape—Rio Santa Maria—Recent fight of Ameri-

eans with the Apaches here—Broad open plains—Continued rain—The Salado—The Medanos or Sand Hills—Painful night's march—Samalayuca—Arrival at El Paso del Norte.	366

SIXTH DIVISION.

EL PASO TO THE GULF OF MEXICO.

CHAPTER XXXVII.

INCIDENTS AT EL PASO DEL NORTE.

Preparations for completing the Survey of the southern boundary of New Mexico—Withdrawal of the military from El Paso—Importance of El Paso as a military post—Its business—Encroachments of the Apaches—Depredations of the Comanches—Suggestions for a better protection of the frontier—Colonel Langberg—Visit to Fort Fillmore—The Mesilla valley—Visit to the Organ mountains—Silver mines—Grand scenery—Return—Bracito and its battle-field—Preparations for leaving El Paso—Mail party attacked by the Comanches—Decide to go by way of Chihuahua—Laxity of the Mexican custom house—Departure of Lieutenant Whipple and party for the Gila—Organization of parties. 381

CHAPTER XXXVIII.

EL PASO TO CHIHUAHUA.

Departure from El Paso—Accident at the start—Farewell to friends—San Eleazario—Fording the Rio Grande—Wagon upset—Guadalupe—Ascend the table-land—Grassy plains, and open country—Ojo de Lucero—Laguna de los Patos—Country overflowed—Wagon mired—More accidents—Carrizal—Ojo Caliente—Rio Carmen—Encounter with the Apaches—A man killed—Animals lost—Ojo de Callejo—Mexican soldiers—Precautions to avoid a surprise—Laguna de Encinillas—El Penol—El Sauz—Rio Sacramento—Battlefield—Notice of the battle—Arrival at Chihuahua. 401

CHAPTER XXXIX.

CHIHUAHUA AND ITS VICINITY.

	PAGE
Repairs on wagons—Mr. Flotte and his persecutions—The road infected by Comanche Indians—Guard hired—General Trias—Governor Cordero—A dinner and ball—Ladies of Chihuahua—Dinner to General Trias—Obtain important documents relating to the boundary—Description of Chihuahua—Causes of its decline—Its mines—The expulsion of the Spaniards—Labors of the Jesuits—Aqueduct—The Cathedral—Mine of Santa Eulalia—Casa de Moneda—Commerce—How carried on—Agricultural products—Alfalfa and its value—Heaps of scoria—Grazing lands—The plateau—Immense herds of cattle—Height of the table land—Climate—Diminutive dogs.	424

CHAPTER XL.

CHIHUAHUA TO THE RIO FLORIDO.

Departure from Chihuahua—Additional escort—Mr. Flotte with his family join us—Bachimba—Santa Cruz—Grist mill—Smelting works—Saucillo—Attack of the Comanches—La Cruz—Las Garzas—Ford the Conchas—Santa Rosalia—Its defences erected against the Americans during the war—Ramada—Rio Florido—Guajuquilla—Fertile valley—Monument to our Lady of Guadalupe—Search for meteorites—Hacienda—Blanca—Wagon upset in an acequia—Hacienda de Concepcion—Curious mass of meteoric iron—Account of meteorites in the vicinity—Hacienda del Rio Florido.	442
---	-----

CHAPTER XLI.

RIO FLORIDO TO PARRAS.

A mule kidnapped—La Noria—Cerro Gordo—Enter the State of Durango—Another escort—Miserable condition of the Mexican soldiers—Recent battle here with the Comanches—La Zarca—Vast herds of cattle and horses—Scarcity of wood—Droves of horses—San Pedro del Gallo—Rio Nasas—Fertile valley—Culture of cotton—Corn-fields without irrigation—La Noria de Pedrecina—Silver mines—Cuencame—Another

FOURTH DIVISION.

JOURNEYS AND INCIDENTS IN CALIFORNIA.

CHAPTER XXII.

SAN DIEGO TO NAPA VALLEY.

Arrival of Dr. Webb and his party—Dr. Webb's report of his journey—State of the survey—Reduction of the Commission—Advance of wages—Diegeno Indians—H'hana Indians—Leave for San Francisco—Its fine harbor—Extensive commerce—Great activity and enterprise of its people—Origin of its name—Contrast between the wants of the Californians in 1770 and 1850—Trip to the Geysers—Benicia—Application to Gen. Hitchcock for an escort to the Commission on its journey back—Vallejo—Napa village—Napa valley—Its beauty and fertility—Mr Yaunt—His history—Red-wood trees—Their great height—Enormous yield of vegetables—Thermal springs.

ON the 11th February, Dr. Webb, with his party, reached San Diego, most of them on foot. They had experienced great privations, and had lost the larger portion of their animals by famine. The following letter from Dr. Webb shows the character of his journey.

“SAN DIEGO, CALIFORNIA, February 14, 1852.

“SIR: I have the honor to announce that I arrived here with the little party under my direction on the

11th instant, all in good health and spirits, notwithstanding we had to encounter numerous difficulties, undergo some hardships, endure some privations—to be exposed to the hostile attacks and depredations of Indians, and subjected to the loss of most of our animals and much of our clothing, &c., and were necessarily placed on short allowance—compelled to walk a large portion of the distance, and be our own escort and night guard.

“The mail closes so very soon, that it is impossible for me to render, in detail, a report of the trip at this time. I can only state, in brief, that the party consisted of twelve individuals and twenty-seven riding and pack-mules.

“The animals, which were mostly feeble at the outset, and consequently not suited for such a journey, soon gave convincing proofs that they could not hold out, and daily, after leaving the Pimo villages, became reduced in number—sinking under the combined influence of excessive heat, deficiency of grazing, and destitution of water. Of the twenty-seven, but three were in a suitable condition to be brought in; five more I left at Williams’s rancho, about fifty miles distant, to recruit; and the remainder sank under their loads at various places on the desert, and were necessarily abandoned to their fate; which was either to fall into the hands of roving Indians, who, like so many hungry vultures, were continually hovering around, anxiously awaiting an opportunity to avail themselves of any accident or misfortune that might occur, whereby they could gain possession of any of our property; or should they elude the Indians, their fate most

inevitably was, in their enfeebled state, to become an easy prey to the hungry wolves, which in great numbers were constantly prowling about, making night hideous with their howlings; and not unfrequently so impatient were they to seize upon the poor animals, that they could be seen skulking close to our camp in broad daylight.

“The loss of pack-mules of course occasioned a sacrifice of much other property, as we had no relief mules with us. Most of our cooking utensils were dropped from time to time, at various places on the route. We had also to *cache* all of our camp stools and other furniture, some of our bedding, much clothing, books, papers, etc. Eventually, we were compelled to abandon our tents: so that rain or shine, wet or dry, we had to stop at the end of our day's journey in the open air, without any means of protection by day from the scorching heat of the sun; and at night we stretched out upon the ground, unsheltered from the inclemency of the weather, and the cold searching blasts and chilly atmosphere, though at mid-day the dry, brain-burning heat, was almost too much to bear. Soon after sunset, an icy feeling, nearly as intolerable, would pervade us; the variations between night and day often amounting to sixty and seventy degrees of temperature.

“Twelve days of the journey I walked, having relinquished my animal for pack-mule purposes before we reached the junction of the Gila and Colorado Rivers. Subsequently, others followed the example; until at length but two retained possession of animals.

“We had no escort; and therefore, after walking all day, we were obliged to take our turns at standing guard at night. Our provisions became so diminished in quantity as to compel me to put the whole party on short allowance. We lived principally on meat, mush, and mutton, without any vegetables. But one sheep (long, lank, raw-boned animals) was allowed to twelve men for four days, and even then our last meat was consumed a week before our arrival; and we were forced to deprive ourselves of a portion of our mush to furnish food to our animals, owing to the entire absence, for several days on our route, of all grass, shrubs, and trees.

“Much is said by travellers respecting the desert of Sahara; but, in barrenness of verdure, destitution of water, tremendous storms of sand, etc., etc., it is doubtful if any tract of land can surpass the jornada which we crossed. Indeed much of this country, that by those residing at a distance is imagined to be a perfect paradise, is a sterile waste, utterly worthless for any purpose than to constitute a barrier or natural line of demarcation between two neighboring nations.

“Notwithstanding our many perils, privations, and suffering, mostly attributable, when traced to the true source, to our imperfect outfit at the Copper Mines, from the negligence, wilfulness, or some other unjustifiable cause on the part of those whose duty it was to attend to the business; notwithstanding the many additional obstacles thrown in the way; notwithstanding the continued succession of disappointments which we encountered in numerous shapes, and of varied hue, where the doing or neglecting to do, depended

upon the will of man ; thanks to the protecting care of a divine and overruling Providence, we escaped unharmed from the many dangers with which we were surrounded, and the difficulties in which we were involved, and have brought in our little party in the enjoyment, as already observed, of good health and spirits.

“I remain, sir, very respectfully, yours,

(Signed)

THOMAS H. WEBB,

Secretary to Boundary Commission.

“HON. J. R. BARTLETT,

“ Commissioner, etc.””

The animals brought in by the several parties were greatly reduced by their long and painful journey, owing chiefly to their poor and scanty food along the Gila, and from that river to the coast. They were now placed in a grassy valley near the mission, some five or six miles distant, where the feed was pretty good ; but they were so completely broken down, that many weeks would be necessary to recruit them. The surveying parties during this time were engaged in reducing their observations and in plotting their maps.

Although the entire boundary along the river Gila was not completed, it was a source of peculiar satisfaction to me that we had accomplished so much. It is more than the most sanguine in the Commission expected to perform in so short a space of time, surrounded, as the operating parties were, with so many serious impediments. To cross a wilderness, such as it may in truth be called, from the Rio Grande to the

Pacific Ocean, a distance of more than eight hundred miles, would at any time be a labor of difficulty. But when this whole line is through a desolate region, with a scanty supply of grass for the animals; with large tracts destitute of water, and no means of procuring provisions; and furthermore, when nearly the entire distance is invested by hostile Indians, the work is one for the near completion of which we could not be too thankful. The whole came through in good health, and with the loss of but one man, Thomas Harper, an attendant on instruments in Lieutenant Whipple's party, who was unfortunately drowned whilst bathing in the Colorado. The amount of public property lost or abandoned on the journey was not large, and could easily be replaced in this country.

During my short stay at San Diego, I was busily occupied in paying off and reducing the Commission. Several of the assistants desired to leave here, and the larger portion of the mechanics and laborers. In fact, I found it difficult to keep such as were necessary to take care of the animals and other property, as well as the cooks and servants needed to attend the several messes. Wages were exceedingly high, and I was compelled to advance the pay of all that remained to the California rates, which were from fifty to eighty dollars a month for servants, cooks, teamsters, and herdsmen. After reducing the parties, and placing those who remained in comfortable quarters (for the weather was cold and wet), I made my arrangements to go to San Francisco, in order to procure a new outfit of tents and camp equipage; to have the instruments repaired and put in order; to lay in provisions for our

return; and to negotiate my drafts on the government to meet these several expenditures, as well as to pay the officers and men attached to the Commission.

No event that is worthy of mention occurred here, except a visit from a band of Diegeno Indians. A chief and several of his tribe were sent to me at my request by a Californian gentleman. They were a miserable, ill-looking set, with dark brown complexions and emaciated bodies; and though the weather was cold, they were but slightly clad. Articles of old and cast-off clothing, such as a tattered shirt and pantaloons, were all that the best could boast of. One, I think the chief, had a piece of a horse blanket around his cadaverous-looking body. I managed to get from them a vocabulary of their language; though I must confess that, with the exception of the Apache, I never found one so difficult to express, in consequence of the gutturals and nasals with which it abounded. I finally got the words so correct, that the Indians could recognise them, and give me the Spanish equivalents. I tried to write down some short sentences, but was obliged to give up the attempt as unsuccessful. I could not combine the words so as to be understood, in a single instance. These Indians occupy the coast for some fifty miles above, and about the same distance below, San Diego, and extend about a hundred miles into the interior. They are the same who were known to the first settlers as the *Comeya* tribe.

I also found an Indian here from the Upper Sacramento River. He had been taken prisoner by the American troops about three years before, and was now living with some of the officers. He was quick and

intelligent, and answered promptly my questions relative to his tribe and country. I could not, however, ascertain the precise locality of his people, which he called the *H'hana* tribe—the *H* a deep guttural. I got from him a complete vocabulary of his language.

On the 24th of February, I embarked with several officers of the Commission in the steamer *Sea Bird*, for San Francisco. The boat stopped on the way at the several ports of San Pedro, Santa Barbara, and Monterey; but as the weather was boisterous and attended with rain, I did not land. On the evening of the 27th we reached San Francisco.

To give an account of this wonderful city which has sprung into existence in the last four years, and whose rapid growth and extraordinary prosperity have astonished the world, is not my intention. No city on the face of the globe has ever attained the position that San Francisco has in the same period; and it is yet progressing. It is now almost the first in population on the western coast of the American continent; and but a few years will elapse before it will surpass all the rest. In point of commerce, the great ports of Europe and on the Atlantic coast of the United States alone, can vie with it. As the outlet of the principal and almost only rivers of California, it will continue to bear the same relation to the interior as New Orleans and New York do to the United States east of the Rocky Mountains. The harbor of San Francisco is one of the most spacious in the world, easy of access, of a convenient depth for anchorage, and protected from storms. The city itself now presents a strange medley of buildings, from the rudest hovel and canvas tent to the ele-

gant mansion and the most substantial warehouses. The former, however, are rapidly giving way to the latter; and now that bricks of a superior quality are made here, and excellent building stone is found near at hand, no one will think of putting up wooden buildings within the city. In the streets of San Francisco all is bustle and confusion. Crowds are constantly passing and repassing. The wharves are thickly lined with magnificent ships from every quarter of the globe, pouring in their thousands of immigrants, and discharging their valuable cargoes. The ocean steamers, each bearing from five hundred to one thousand passengers, are weekly arriving; while the river boats, which take their daily departure for the interior every morning and evening, present the same moving crowds going and coming as the Hudson River boats at New York. All go full; and one is as much puzzled to find a spare seat or stool on which to rest his weary limbs, as on board the excursion boats from our Atlantic cities. The stages and other means of conveyance are equally crowded. The throng moves to and fro, from the city to the mines and the interior, and thence back again to the city. Go to the business streets, and the auctioneer's hammer is heard at every turn, knocking off to the anxious bidder every article of commerce. Stocks, gold mines, ships, whole cargoes of merchandise, are bought and sold with the same freedom as in the Royal Exchange of London, the Bourse of Paris, or in Wall-street, New York. There are customers for every thing, and an abundance of gold to meet any purchase however large. There is no project too great for the Californian of the present day. He is ready for any undertaking, whether

it be to make a railroad to the Atlantic, to swallow up Mexico, or invade the empire of Japan. New York is now the first city on the American continent, and San Francisco is destined ere long to be second.

San Francisco is said to have obtained its name in the following manner: "When Father Juniper Serra received his orders from the Visitant-general respecting the names which he was to give to the new missions in California, he observed that the name of the founder of their order was not among them, and called the attention of his superior to the fact, exclaiming, "Is not our Father San Francisco to have a mission?" to which the Visitant-general replied, "If San Francisco desires a mission, let him show you a port, and he shall have it." In the year 1769 an expedition was dispatched from San Diego, for the purpose of settling Monterey. The expedition missed the port, but discovered a much larger and finer bay further to the north, which had been till then unknown. The commander of the expedition and his religious associates decided that this discovery must be the work of St. Francis, and accordingly they gave his name to the place, setting up a cross, and taking possession after the usual manner.*

To show the striking contrast between the wants of the zealous priests who colonized California in the year 1770 and the Americans of 1850, I give another quotation from a letter written by the same excellent man to Father Palou. "As May made a year since I received a letter from any Christian country, your Re-

* Palou. Vida del Padre Fray Junipero Serra, Mexico, 1787, p. 88.

verence will imagine how deficient we are in news: but for all that, I only ask you and your companions, when you can get an opportunity, to inform me what our most holy Father the reigning Pope is called, that I may put his name in the canon of the mass; also to say if the canonization of the beatified Joseph Cupertino, and Serafino de Asculi has taken place; and if there is any other beatified one, or saint, in order that I may put them in the calendar, and pray to them; we having, it would appear, taken our leave of all printed calendars. Tell me also, if it is true, that the Indians have killed Father Joseph Soler in Sonora, and how it happened; and if there are any other friends defunct, in order that I may commend them to God; with any thing else your Reverence may think fit to communicate to a few poor hermits separated from human society. We proceed to-morrow to celebrate the feast of Corpus Christi (although in a very poor manner), in order to scare away whatever imps there possibly may be in this land." *

The Californians of our day, instead of asking for information about beatified men or saints, in order to put them on the calendar and pray to them, would feel a much deeper interest in knowing the state of political parties in the Atlantic States, or the prices of stocks, of sugar, and whiskey; and where one would care to hear about the Pope of Rome, a hundred would prefer news respecting the Emperor of China. †

* Palou. Vida de Fray Junipero Serra, p. 102.

† I have reference now to the interest felt in the present contest in China between the rebel Tien-teh and the Tartar sovereign.

For three weeks after I arrived in San Francisco it rained incessantly, confining me most of the time to the house. The result was a great rise in the rivers, so that the mining regions were laid under water, and became impassable. The Sacramento was so swollen as to inundate the city of the same name. This state of things prevented me from visiting the interior, and particularly the gold region. Having a couple of weeks still to spare before our camp equipage would be ready, I determined to avail myself of this brief space in visiting some of the many interesting objects in which California abounds. To examine the gold mines in so short a time with any satisfaction, seemed impracticable. I therefore concluded to visit some localities which were less known, and which would be a greater novelty than the gold region, with which I already felt pretty well acquainted through the daily accounts of them in the newspapers. I had heard an interesting description of some *geysers* and a volcanic region at the head of Napa Valley, which I determined to visit as soon as the travelling would permit.

Accordingly I left San Francisco on the 17th of March, accompanied by Dr. Webb and Mr. Thurber, for Benicia, where we arrived in two hours. Our steamer was crowded with passengers, chiefly bound for the mines, among whom were a number of Chinese. These men were dressed in their native costume, and each carried with him a huge pair of boots, showing plainly to what region he was destined.

Benicia was for a while the rival of San Francisco; though I cannot see why such aspirations should have been indulged in for a moment. It is situated on the

Straits of Carquinez, about thirty miles from San Francisco, on a gentle slope, which becomes almost a plain as it approaches the water's edge. It contained at the time of my visit about 1500 inhabitants, including the soldiers now stationed here. Its buildings are mostly of wood, and among these are several hotels. The best of them is the "American," a neat and well-kept house, where we stopped. It was then the Head-quarters of the Pacific division of the U. S. Army. The large deposit of Quarter-master's and Commissary's stores had been recently removed hither, and efforts were making to have the Navy yard here also. The Pacific Mail Steam Ship Company had its depot here, and next to the Navy yard was the most valuable accession it could possibly enjoy. The steamers all lie here until a few days before sailing, when they move down to San Francisco. This company furnished much business to the place with its large coal depot, ship yard, and various workshops, where several hundred men were constantly employed. The military post is about a mile from the town, and consists of a few wooden buildings.

I called on General Hitchcock, commanding the Pacific division of the U. S. Army, for the purpose of obtaining an escort for the Commission from San Diego to the Pimo villages on the Gila. This seemed necessary, as the command of Colonel Craig amounting to twenty-five men, which accompanied the surveying parties down the Gila, had all deserted but five, on their arrival at San Diego; and of these, three were non-commissioned officers. General Hitchcock, with the promptness and liberality which have ever distin-

guished him, at once acceded to my request, and gave me an order on the commanding officers at San Diego and Fort Yuma to furnish me with such a force as they deemed necessary.

It was from Benicia that we were to take the road to Napa Valley. On making known to General Hitchcock my desire to visit the Geysers, he kindly furnished me with horses and a pack-mule for the purpose. To Major Allen, the Quarter-master, I am also indebted for his promptness in facilitating the wishes of myself and party in our proposed trip, and for sending me a trusty man.

March 19th. Our horses, mule, and attendant were promptly at the door by 7 o'clock; and after breakfast we took our departure. Proceeding along the shores of the bay, we passed the great projected city of Vallejo, the once intended capital of the State. It now stands naked and alone, its large houses tenantless. As the capital of California it might have become a place of importance; but without such factitious aid there is nothing to build it.

Here we entered Napa Valley. The hills on both sides as well as the valley were covered with a luxuriant growth of wild oats, and immense herds of cattle were roaming about feasting on them. Wild flowers of varied hues were thickly scattered around, and every thing showed that the heavy and continued rains had given new life to vegetation. Our course was now a northerly one, directly up the valley. Napa Creek, which we saw at a distance, makes up it, and affords sufficient water for small vessels, several of which we saw gliding up. The valley soon became perfectly

level, without a hill or depression. In many places ploughmen were at work turning up the soil, which was of the richest description. Barley appeared to be the principal grain sowed, this being in more general use for horses than oats, and found to give a better yield. In one place I noticed a hill, the whole of which had been sowed with barley, presenting a field of more than a hundred acres. The soil here was loose; and as the water had run off, the ground was in a fit state for cultivation. The valley below was still very wet, and would not be in a fit state to plough for weeks yet. On this account, the declivities possess an advantage for early planting, over the level plains.

At 2 o'clock reached the village of Napa, where we dined. Distance travelled, twenty miles. The road was excellent, except in two places, where the valley was still wet, and where our horses sank deep in the mud. Napa Creek is navigable to this point, even for vessels of a large burden, should it be necessary to bring them here, which will hardly be the case. Near the town is the hulk of a ship. It was bought by a gentleman in San Francisco for a trifle and brought here, where it is used as a storeship, as well as for the residence of the owner and his family. She cost much less than it would have done to erect a small dwelling, and the owner has besides the advantage of a large warehouse. She lay close by the river's bank; and with a doorway cut in her side, the entrance was made quite easy. A steamboat now runs to San Francisco, which will tend to populate rapidly this beautiful valley, and render the town of Napa the centre of one of the richest agricultural districts in the State. After

dinner we rode five miles, to the house of Joseph W. Osborne, Esq., a merchant of San Francisco, who had invited me to make him a visit. Mr. O. had preceded us a couple of days, and met us at his gate, giving us a warm reception.

Mr. Osborne's place was the most beautiful and picturesque I had seen in the valley. In fact, it was the only house wherein there was any attempt at taste and comfort; for the country was too new to expect much in this way yet. But even his was a small and unpretending cottage after the New England fashion. The valley here is about four miles in width. Where it opens on St. Pablo Bay it is about six miles, but it gradually contracts towards the north. At the entrance it is an open plain, destitute of trees, and covered with luxuriant grass; but here it assumes a new aspect, such a one, too, as I had not before seen in the country. It is now studded with gigantic oaks, some of them evergreen, though not so close together as to render it necessary to cut any away to prepare the land for cultivation. These magnificent oaks are found sometimes in long lines, and again in clusters of twenty or thirty, forming beautiful groves; then again a space of ten or twenty acres will occur without a single tree. If this romantic valley were transferred to the older countries of Europe, it would be taken for the domain of a prince or a nobleman. It answers to the idea one has of the old and highly cultivated parks of England, where taste and money have been lavished with an unsparing hand, through many generations. As one emerges from or enters each grove, he involuntarily expects some venerable castle or mansion to appear;

or to find himself among some secluded villages. But in the entire length of the valley there are no houses to be found within a less distance than five miles of each other, and these too of the most humble and unpretending character. What is singular, and to me unaccountable in these groves of large trees is, that there are no young ones, none but the venerable and full-grown oaks, which, doubtless, for centuries have held exclusive sway over this wide-spread and beautiful domain. Nor is there any undergrowth of other trees and shrubs. I can only account for this deficiency by attributing it to fires since the occupation of the country by the Spaniards; or, by supposing that the immense herds of cattle, which for a century past have occupied the valley, have browsed upon the shrubs and young trees, until they destroyed them, and afterwards kept down the shoots as they sprang up.

The valley is hemmed in on both sides by ranges of low mountains, running north and south, which are generally covered to their very summits with forest trees. Here and there bold rocks jut out, presenting the most fantastic outlines; while between the valley and the mountains runs a lower range of rounded hills, dotted with small bushy oaks and pines, which present a fine contrast with the more sombre hues of the mountain foliage. Occasionally the gigantic *palo colorado* (red wood) raises its tall head far above every other object, making even the huge oaks appear diminutive.

In the midst of the valley winds a small stream, called Napa Creek, its course marked by the graceful

willows that grow along its margin. This creek is chiefly supplied by springs near the head of the valley ; but during the rainy season several mountain torrents empty their waters into it—indeed, some of them I was told contribute a portion during the whole year.

The larger portion of Napa Valley was still in the state in which nature had left it, but had all been taken up by recent settlers, and was fast being brought into cultivation. A road had just been laid out through its centre, and every farmer was occupied in marking out his land and dividing it into lots inclosed by substantial rail fences. Ploughs were cutting up the virgin sward in all directions ; and in one place I saw a ditching machine in operation. It answered the double purpose of making a ditch four or five feet wide, with an embankment of sufficient height to answer for a fence or wall. This machine was worked by two or three oxen and a windlass. It is a rapid method of accomplishing two most important objects ; and the mound is said to keep the cattle out as well as a high fence.

Mr. Osborne's men were all New England farmers, several of them from Rhode Island ; and it is astonishing to see how much more work one of these men will perform than a Mexican or Californian. He pays them seventy-five dollars a month, and finds them, which pays him better than employing ordinary hands at half the price. Mr. O. has owned this property but one year ; and a furrow was never turned on it or a seed sown, until he came into possession. He has now more than a hundred acres under cultivation, a considerable portion of which is protected by a post and

rail fence of red wood. Many fruit trees, grape vines, flowering shrubs, etc., are in a flourishing condition around his house. In no part of the Atlantic States or Mississippi Valley could such improvements be shown in the same time, except on prairie land.

March 20th. This morning we called on Mr. Yaunt, a Missourian, and one of the oldest settlers in the valley. Mr. Y. came here some twelve or fifteen years ago, and obtained a large grant of land from the Government; he, however, has cultivated very little of it, but has used it, like the other great landholders of the country, for a cattle range. The other original grantees of land in Napa Valley were Mr. Fowler, Dr. Bale, an Englishman, and Don Salvador Vallejo. The usual measure of land in this country, as well as in Mexico, is the square league, containing about five thousand acres. Señor Vallejo, who was the largest proprietor here, owned six square leagues, or thirty thousand acres. It is well for the country that these large estates are now being divided and brought into market. They will, doubtless, ere long be eagerly sought after, on account of their extraordinary fertility and beautiful situation, by gentlemen who wish to get away from the bustle of a great city, and enjoy the retirement of a country life.*

I was desirous to have Mr. Yaunt accompany us

* In an agreeable work by Lieutenant Revere, I find the following history of Mr. Yaunt: "This old man had led an adventurous and checkered life; in the course of which he had fought under Jackson at New Orleans, and in the Seminole war had been taken prisoner by the Indians, and actually bound to the stake. He had been a hunter and a trapper, and Indian fighter at large, in the heart of the continent, until

to the Geysers, and he readily promised to go; but as he did not appear at the time appointed, we waited for him till twelve o'clock, and then determined to proceed without him. Mr. Osborne now joined our party, and we resumed our journey.

The valley continued as before, level, and without

his combative propensities were gratified—and he finally found himself one day at the “jumping-off place,” and made his first attempt at ocean navigation on the bosom of the broad Pacific. In the unpretending skiff of an otter hunter, often unaccompanied save by his trusty rifle, he coasted the shores and islands of California in search of the pelt of his valuable prey. While employed one day (in the year 1836) in his regular pursuit, he chanced to steer his skiff into the navigable creek or estuary of Napa, rightly judging it a place of resort for his furry friends. The valley was then inhabited by none but Indians; and he made his way up to a beautiful spot, a few miles from his boat, which had been selected for a rancheria by a tribe called the “Caymas.” Here he sat down to rest; when suddenly there flashed upon his mind, like a gleam of light, a long-forgotten prophecy of an old fortune teller in his native State. He declares that the sibyl had predicted the spot of his future residence in terms exactly answering to the description of this valley, including all the accessories of grove, plain, mountain, river, and even “medicine water,” as the Indians call the springs. The old man pondered over this prophecy, counted his gains, which had been considerable, and philosophized over the vicissitudes of human life, not forgetting, however, to examine the valley more carefully. On his next visit to Monterey, he became a citizen of California, and obtained a grant of land, embracing the charmed spot indicated by the Western witch. He then came and settled it, purchasing cattle with his gains in the “lower country.” But the happy valley then swarmed with Indians, jealous of white men, and constantly fighting among themselves; so that this elysium was turned into a pandemonium by their screams and war-whoops. He quitted his skiff, formed an alliance offensive and defensive, with the rancheria of Caymas, erected a log house, after the manner of his ancestors in the days of Daniel Boone, and with his faithful rifle—the only fire-arm in the valley—not only stood and repelled the

a hill or an undulation. A luxuriant growth of grass, studded with brilliant wild flowers, lined our path. As we continued north, the adjacent hills became more thickly wooded, particularly with pines and firs; the red-wood, a species of cypress, still more conspicuous, raising its tall stem far above the others.*

attacks of the rival rancherías, but attacking in turn, exterminated the unruly, sustained the wavering, and, single-handed, bullied the whole valley into submission. Many a weary, and anxious, and watchful night did he spend ere this result was achieved; but once accomplished, his sovereignty remained undisputed; the conquered became his servants; and the allies of Caymus remain to this day his laborers and his farm hands."—*Tour in California*, p. 95.

* This tree is remarkable for the great height which it attains. I have been told by credible persons that specimens are now growing which are three hundred feet in height; and I have seen persons who have measured fallen trunks two hundred and sixty-six feet in length. It is one of the most important vegetable productions of California; and besides the various uses to which it is applied when sawed into boards, it is extensively employed for fencing purposes, the grain being so straight that it splits with the greatest ease; indeed, before the introduction of saw-mills, it was usual to split logs of the red wood into planks.

It is also said to be very durable. Colonel Fremont saw posts which had been in the ground three fourths of a century, without traces of decay. The houses built by the Russians at Bodega many years since, are of this timber, with posts sunk in the ground, into which the horizontal pieces are mortised. The planks upon the sides are about three inches thick, and had been but little smoothed off after being split. No signs of decay could be detected even in the posts. At this place, Captain Smith erected a steam, grist, and saw-mill, in 1845, being the first structure of the kind in the country. He states that they could not saw logs much over four feet in diameter, and never cut any less than eighteen inches; and yet the average number of cuts or logs, each of sixteen feet in length from a single tree, was between eight and ten.*

* Report of P. T. Tyson to the Secretary of War, on the Geology and Topography of California.

Passed the farm of Mr. Yaunt, and soon after that of Señora Bale, the widow of an English physician,

Fremont describes the largest red-wood measured by him to be fifteen feet in diameter, and 275 feet in height. Lieut. Stoneman, U. S. Army, speaks of another of about the same height, and twenty-one feet in diameter. The largest tree seen by Mr. Tyson (quoted above) was in the forests near Bodega: it had been cut down and a portion removed; the stump was twelve and a quarter feet in diameter, clear of the *very thick bark*. He saw many trees of nine or ten feet, and those of six and eight feet, were very common.

After examining these forests to some extent, Mr. Tyson says he "measured off a space equal to one seventh of an acre, which was estimated to contain about an average of the forests of that region, and found within it three trees about one hundred feet high and eighteen inches thick, and twelve others varying between four and eight feet in diameter, and from 180 to 230 feet high." It is difficult to form an idea of the product of timber upon an acre containing the proportion within the fractional part above noted, without an arithmetical calculation, when it will be found to produce about one million feet of boards, one inch thick, besides five hundred cords of wood from the tops and limbs.

Captain Smith thinks he alone has seen ten thousand acres of such forest, and Mr. Tyson saw many acres which would yield considerably more in proportion than the measured space.

Judge Thornton speaks of pines which "measured, at a height of between six and a dozen feet above the ground, forty feet in circumference, their bark nearly a foot thick, and between two and three hundred feet high." Between Paget Sound and Fort Harrison, some of the fallen trees have been found to be 265 feet in length. "These trees are perfectly straight and without branches for a distance of 150 feet. In many places where these trees have fallen, they present barriers to the vision even when the traveller is on horseback."—*Oregon and California*, Vol. I. p. 350.

Mr. Walter Hitchcock gives the following account of forest monsters which fell under his observation :

"The big trees (for there are 131 of them over ten feet in diameter standing on the limits of a few acres) stand in Mammoth Tree Valley,

who settled and died here. This lady has a large estate, which contains more improvements than any

about thirty miles north of Sonora, in Calaveras county. The mammoth tree which has been felled, was bored down with long augers, and took four men twenty-two days to get it down. The stump stands about six feet above the level of the ground, and its top has been made level and smooth, which required sixteen days work. I measured it from the inside of the bark across to the inside of the bark, and it measured twenty-five feet, and is perfectly sound clear to the heart. The bark, to the height of 52 feet, has been taken from the trunk in sections, and sent to the fair at New-York. If the top half of the tree were taken off, so as to make a level surface, a stage coach with four horses might be driven on it, from the butt towards the tip, a distance of 166 feet, it being at this length ten feet in diameter. At the length of 280 feet, it is four feet in diameter. At this point it was broken off in falling, and the tip was broken into fragments so fine I could not measure them; but its height had been taken before it was felled, and set down at 300 feet. It is called *arbor vitæ*; but it is not fully decided to what variety it belongs. It is a little curious that no other trees of the same kind can be found less than seven feet in diameter, and this tree is estimated by a scientific gentleman from San Francisco to be 3,100 years old.

“There are many others still standing, of the same kind, which are monsters; some even larger than this, but not sound. One, called Uncle Tom’s Cabin, has a more commodious room in it than many miners’ cabins. There are some large ones blown down, and one I must not fail to describe. It was evidently decayed before it fell, and in its fall broke off sixty feet from the roots. This part is hollow; and I cannot give you a better idea of its size, than by telling you that I rode my horse through it from end to end. At the end where it is broken off, the shell is very thin, and as I sat on the horse, I could not reach my hand to the inner surface, over my head; but half-way through, the shell was as much as three feet thick over my head, and more than that under the horse’s feet, and here it was necessary to lean forward. But this is not the largest. There is another one blown down, which measures 110 feet in circumference and 410 feet in length. This, too, is hollow; and if the hollow were enlarged a little, it would make a very good rope walk.”

other farm in the valley. In her orchard I noticed pear and peach trees, and grape vines in abundance; while around the house were rose bushes and other flowering shrubs. The lady was at work in her garden, in which she seemed to take a deep interest; while frolicking around her were six beautiful children, whose light hair and fair complexion indicated their Anglo-Saxon parentage. Passed other farms, some of which, particularly Mr. Keller's, bore the marks of an old settlement, from the extent of its fences, its barns, saw-mill, and other improvements. Here was a large orchard of peach trees in full bloom; which trees, I was told, were brought round Cape Horn from the Atlantic States. Every thing here was in a flourishing condition; although in the form and arrangement of the buildings a sad deficiency of taste was visible.

A ride of three miles further brought us to Mr. Kilburn's, a Missourian, with a Californian wife. We stopped here for the night, and were disappointed in not finding Mr. K. at home. He is another old resident, having been some seven years in the valley. As this gentleman was familiar with the district we were about to visit, we had relied on his accompanying us; or, failing to do so, we had hoped to obtain such information from him as would enable us to find the objects of which we were in search. Mrs. Kilburn received us kindly, although we were all strangers to her; nevertheless she seemed a little flustered when we told her we had come to pass the night there. She is quite young, good-looking, and has an interesting family of little ones around her, who, like the children before

mentioned, exhibit their Anglo-Saxon descent. A fine supper was soon prepared for us; after partaking of which, we were directed to our beds in the chamber above, all clean and comfortable.

The valley for the last few miles had diminished much in width, being not more than a mile at Mr. Kilburn's farm. The soil, too, had changed from a black loam to clay and gravel. Nevertheless, vegetation seemed quite as luxuriant, and the valley presented a greater variety of trees. The oak, which, as I have stated, monopolizes the valley below, here gives way to the lofty pine, spruce, red-wood, cedar, &c.

I had heard at San Francisco of the large yield of vegetables on this farm, and made inquiry as to its truth. I found the statement to be correct; and that from two acres of onions planted near the house, Mr. Kilburn had realized last year, in the market of San Francisco, *eight thousand dollars* in cash. He also raised an immense number of cabbages and other vegetables. In explanation of this, I ought to mention that onions are considered the most valuable of all vegetables among the gold miners, on account of their antiscorbutic properties. They grow here to an enormous size, and give an immense yield. My own experience convinces me of the great value of onions where there is a predisposition to scurvy, and there is no vegetable which one craves more than this. Many have I bought at twelve and a half cents a piece, and eaten with more relish than I ever did an orange.

In our ride to-day, we crossed the valley to examine some thermal springs, which are somewhat celebrated here. They are in a plain near the base of a small hill

of conglomerate rock ; but owing to the wet and boggy condition of the valley, we were unable to approach within thirty feet of them. Columns of steam were rising from them on all sides. These springs had been visited by Professor Shepard the year before, and some account of them given by him to the public.* The temperature is said to be constantly changing. Professor S. heard that there was a place near the foot of Mount Helena, where the hot waters formerly flowed, but which had now ceased. This report induced him to visit the spot. "Externally," he says, "there was no uncommon appearance to indicate the locality. Neither a surplus or a scarcity of vegetation, and no appearance of scoria, tufa or travertine, as might have been expected." In one place, however, he found it slightly warm on the surface ; and on excavating to the depth of two feet, it became so hot that he could not bear his hand in the mud and clay. He inserted the bulb of his thermometer, and the mercury at once rose to one hundred and twenty degrees. The temperature of the springs we visited, varied from 105 to 169 degrees.

* See Silliman's Journal, Nov. 1851, p. 154.

CHAPTER XXIII.

THE GEYSERS OF PLUTON RIVER, AND RETURN TO SAN FRANCISCO.

Mount Helena—Russian inscription—Digger Indians—Dwellings—Mode of fishing—Dress—Pass the mountains—Meet bear hunters—Mode of cooking without utensils—Pluton River—The Geysers—Description of these phenomena—Effect of the water on wood—Extent of volcanic action—Return to Camp—Abundance of grizzly bears—Recross the mountains—Return through Napa Valley—Visit to the Obsidian hills—Extensive use of this material by the Indians—Return to San Francisco.

March 21st. Resumed our journey after breakfast; and at Mr. Fowler's, three or four miles distant, met a man who manifested much curiosity in our researches, when he found us inquiring about mines and the volcanic region. He showed Dr. Webb a specimen of ore, which, he said, was from that vicinity. The doctor at once pronounced it zinc, and expressed a doubt about its being found in the state in which it was exhibited to him. But the man insisted that his account of its origin was correct, and furthermore offered to conduct us to the spot; whereupon we set off together under his guidance. Crossing the valley to the opposite side, he led us up a deep ravine, where he leaped from his horse and pointed out the rock from

which he said the specimen was taken. An examination showed it to be nothing but serpentine. He led the doctor to several ledges at some distance, but their character was the same. He had evidently been imposed upon, for he acknowledged afterwards that he did not find the specimen himself. Many tricks of this kind are practised on the ignorant, and they even sometimes lead scientific men astray.

While this man was hunting up his imaginary treasures, I ascended a small hill and took a sketch of the beautiful scenery around. Directly before me on the eastern side of the valley loomed up Mount Helena or Moyacino of the Russians. This is the highest mountain for a great distance around, none within seventy or eighty miles having as great an altitude. On its summit is an inscription in Russian characters on a plate of copper, giving the latitude and longitude of the place. We met several persons who had seen the tablet. The Russians had a settlement called Fort Rosse on Bodega Bay, opposite this mountain; and the tablet was doubtless placed there to show the line of boundary which Russia claimed.

The view here exhibited the finest alpine scenery I had yet seen in California, and showed that we were advancing northward as well as reaching a higher elevation.

Reached Mr. Knight's, twelve miles from Kilburn's, at noon. Here the valley grew quite narrow, or rather terminated, it being intersected by a range of hills. At this place, another valley opened some two or three miles in width, and extended about ten miles farther to the north.

Mr. Knight is a young man from Vermont, who came across the continent about seven years before our visit, with the first emigrants to Oregon. As the country did not suit him, he pushed his way southward, until he struck this valley. He owns a large tract of land here; but in consequence of his distance from market, he has, very wisely, turned his attention from cultivating the soil, to that of raising stock. His isolated position, and the hills of grass and wild oats which surround him on every side, render it a most advantageous one for this purpose. Although surrounded by wild beasts and warlike Indians, and with no neighbor within twelve miles of him, he had not forgotten all the enjoyments that belong to civilized communities, as was evinced by a piano-forte and a case well filled with books.

An Indian village stood a few hundred yards from the house; and at my request Mr. Knight went out and brought me three of the most intelligent among them, from whom I obtained a full vocabulary of their language. Like many other tribes of the country, and of this region in particular, they appeared to have no name for themselves as a people. By the white people, these and all other Indians between the Sacramento and the coast, and thence through the central parts of the State, are called "Diggers," or "Digger Indians," from the fact that they live chiefly on roots, which they collect by digging. I therefore set them down as Indians of Napa Valley. We had met with several small bands, and passed a few villages on our way up; but from none could I learn that they had any name for their tribe. This fact will account for

the great diversity in the names of the California Indians as given by travellers. In examining the various books on this country and articles in scientific journals, I find tribes mentioned by names which are not elsewhere to be found; and in my own inquiries I have found tribes who called themselves by names which I never heard of before. This has induced me to believe that the small tribes or bands, which abound here more than in any other part of North America, when asked to what tribe they belong, give the name of their chief, which is misunderstood by the inquirer to be that of the tribe itself.

Their houses are circular, and from twelve to thirty feet in diameter, the interior usually excavated about three feet below the surface of the ground. Within this circle posts are planted, forked at the top, upon which rest poles reaching from one to the other. The spaces between the posts are filled in with sticks or tules, against which the earth is firmly banked up outside. The roofs are dome-shaped, and, in the smaller houses, supported by a single post in the centre, on the forked top of which rest two main rafters, with their outer ends planted in the ground. From these are stretched stout poles, about a foot apart and thatched with sticks and tules, or rushes closely interwoven, and covered with a solidly pressed layer of earth about a foot thick, making a roof completely water proof in the heaviest rains. In some villages the houses have but one aperture, which is on the top of the roof, and serves for both door and chimney. This is entered by a sort of rude ladder, or by notches cut in the centre-post. Others have an opening at the

INTERIOR OF INDIAN HUTS, CALIFORNIA.—P. 80. VOL. II.

side, so small as not to be entered except by crawling on the hands and knees. Around the sides of the interior are wide shelves, formed of poles and rushes resting on forked posts, which serve for beds.

Summer huts of California Indians.

In the view of the interior of one of their dwellings is seen a number of decoy ducks which they use to good advantage. Although the California tribes exhibit much skill in fishing and in trapping game, and the erection of their dwellings, they show little ingenuity in the arts of design. The accompanying rude figure in wood, of a woman and child, which was

found on the coast, is all that I have seen of their carving.

Figure cut in wood.

The Indians dwelling near the great rivers of California make much dependence upon the salmon and sturgeon which they can take. For this purpose they use both nets and spears. When the river is wide, the nets are stretched by means of booms projecting from the banks, sometimes a hundred feet into the stream. These booms are made of the trunks of trees, fastened together at the ends, and kept at a right angle with the shore by stays of grape, vine stretching from the boom to trees or stakes. Beneath the outer end of the boom is a float or raft of tulé, upon which is stuck a branch gaily trimmed with feathers and other ornaments, as a charm to secure success. Other charms, usually made of bunches of feathers raised upon poles, are displayed along the bank, where are also one or two huts for the party in attendance. One of the party holds constantly in his hand a line attached to the net, by means of which he can feel when a large

fish is entangled, whereupon the net is hauled in and the prize secured.

California Indians catching salmon.

When a sturgeon is caught, the spinal marrow, which is considered a delicacy, is drawn out whole, through a cut made in the back, and devoured raw, with a rapidity quite startling to one not aware of the strength of an Indian's stomach.

The spear is a very ingenious and effective contrivance. When thrown into a fish, the head, which is of bone with a line attached towards the point, detaches itself from the pole, which serves as a drag to weary out the fish. As soon as the pole can be seized, nothing remains but to haul the prey in.

The men either go naked or wear a simple breech-cloth. The women wear a cloth or strips of leather around their loins. A basket pointed at the lower

end, is in universal use among them, for gathering the roots and seeds which form their chief subsistence. This is carried on their backs, supported by a band across the forehead. Their arms of defence are bows and arrows. Some tribes, however, make use of the spear or lance. In one respect the California Indians differ from all others. I allude to their beards, which are generally permitted to grow. It is true they are not as thick and bushy as in the white race, but short, thin, and stiff. I have never seen them extend beyond the upper lip and the chin. The hair of all the California Indians I have seen is cut short.

After partaking of an excellent dinner, we took leave of our host. For several miles our journey extended over a plain hemmed in on all sides, on which large herds of cattle were grazing; then came ranges of low hills, all covered with wild oats or clover. The cattle truly luxuriated here. A ride of twelve miles, alternately over low hills and valleys, and winding through clusters of trees and shrubbery, brought us to the establishment of MacDonal'd, the last settler in this part of the country, towards Oregon. We received a cordial welcome from Mr. MacDonal'd and his wife,—a young woman of twenty, who must have some courage to settle down in this lonely spot. On making known my intention to visit the volcanic region, Mr. MacDonal'd consented to be our guide, although busily engaged in putting in his crops.

Having an hour or two to spare before dark, I took a sketch of the valley and adjoining mountains, all of which presented a most picturesque appearance. The valley is here very limited, being confined to

patches of from twenty to fifty acres, but all connected by a small and never-failing stream of excellent water. The object of our friend in settling here was to secure to himself a large tract of land without encroachment. Thus he has a section of good tillable land of one hundred and sixty to two hundred acres, and on the low hills around it about four thousand acres excellent for grazing purposes. Having secured all the valley, no one would take up land on the hills. His section would, therefore, give him the use of the large tract adjacent, which was all he required.

March 22d. Took an early breakfast, and started at seven o'clock. MacDonald led the way, and we followed him in Indian file. We had now no more beautiful valleys or grassy plains to traverse. Nothing but a succession of lofty and rugged mountains lay before us, through the intricacies of which we had to wind our way. There was no road, nor even a trail, save those made by wild animals, of which there was an abundance in these parts. Our guide often directed our attention to the huge tracks of the grizzly and brown bear, and again to those of the elk, which constantly crossed and recrossed our path. He had been several times to the place we were going, and knew the country well; yet so wild and rugged was it, so dense the forest, and with such a succession of ascents and descents, that he sometimes seemed at a loss which way to go. The general direction was well known; but among such a number of deep gorges and ravines, mountains, hills, and valleys, it was no easy task to select the right one; and a mistake in the mazes of such a place would lead us into inextricable difficulties.

At noon, having been five hours in the saddle, we stopped to rest ourselves, as well as our animals, on one of the elevated spurs, from which we had a grand view of a vast stretch of country towards the coast. Some ten or fifteen miles distant lay Russian River, winding its way along a beautiful valley, bounded by a succession of hills; and beyond this rose the coast range of mountains. While the animals were grazing, I took a sketch of this enchanting spot.

Pursuing our journey still over hills and through ravines; forcing our way among the thorny chapporal and thickets;—now winding along the side of a steep hill, where a single misstep would throw horse and rider some hundred feet below, and now leading our frightened animals up some precipitous ascent where it was unsafe to ride them, we at length reached the summit of the mountain beyond. From this elevated point the view was grand beyond description. On the east, far in the distance, the horizon was bounded by the snow-capped summits of the Sierra Nevada, forming a well marked line with the deep blue of the horizon. Nearer, and on every side, lay mountains of every variety of form; some rugged and bare, others covered with a deep Alpine foliage, while others again of less height, from their yellow hue, seemed clothed with the rich verdure of wild oats. Four or five miles distant, in an opening surrounded by rugged mountains, lay Clear Lake.

After following the summit we were now on, for a couple of miles, we began to descend again into the deep gorge, through which runs Pluton River, on whose banks are the volcanic phenomena and geysers of

which we were in search. The descent was here so steep that we were obliged to dismount from our animals and lead them down. Our progress was now necessarily rapid, and we soon reached the base of the mountain. Here we suddenly came upon four men, who had come out a few days before us from MacDonald's to amuse themselves in hunting the grizzly bear. We reached this place at four o'clock, a distance of but sixteen miles, after a most fatiguing journey; although the beauty and variety of the scenery well repaid us for the effort. As there was still a descent of five hundred feet to the stream, and a mile to the geysers, we determined to leave their examination till morning, and devote the remainder of the day to rest and the preparation of our dinner.

As the hunters had nothing but bear's meat in store, three of them took their rifles and went out to procure a deer for dinner. In less than an hour all returned, each bringing with him the hind quarters of a fine deer, having been equally successful in their short hunt. While they were absent, our servant had made a fire, and got a kettle of boiling water ready for making coffee. In ten minutes after their return, the venison and bear's meat were roasting before the fire, and emitting the most appetizing odors.

The method of preparing a fine game dinner without a single cooking utensil deserves to be mentioned. First, a number of sticks are cut about two feet in length, the size of one's finger, divested of their bark, and sharpened at one end. These correspond to the spits in civilized roast-ovens. The meat is now cut up into pieces about three quarters of an inch in thickness

and half the size of one's hand, with a hole in the centre. Through these the sharpened stick is thrust, and its lower end planted in the ground before the fire. As our fare consisted of venison and bear's meat, successive layers of each were put upon the sticks, the fat of the latter, as it dripped down, basting and furnishing an excellent gravy to the former. In fifteen minutes, with occasional turning, the dinner was pronounced ready to be served up.

Being unprovided with the luxury of a table, we seated ourselves on the grass, beneath the wide-spreading boughs of a tree, and a few yards from the fire, in order to be near the kitchen, and to have our meats and coffee warm. Before each person was stuck in the ground a stick of the roasted meat. A bag of hard bread (pilot bread), some sugar, salt, and pepper, were placed near, and each man was provided with a tin cup filled with coffee. Thus furnished, and with sharp appetites, we fell to, and never was a feast more heartily appreciated. Our coffee and bread were excellent; and those who were not satisfied with one stick of meat, found another ready at the fire when the first was gone.

By the time we had finished our dinner, it was dark. We then sat for an hour or two listening to the feats and adventures related to us by the hunters before referred to, all of which were exciting and full of interest; after which, one by one, we rolled ourselves in our blankets, and dropped asleep, dreaming of grizzly bears, elk, venison, and the wild scenery we had been enjoying during the day.

March 23d. Was up by sunrise, after an excellent

night's rest; and took a bath in the waters of a little stream that tumbled down within twenty feet of our camp-fire, by which time our breakfast was ready. This was a counterpart of yesterday's dinner, viz., bear's meat, venison, hard-bread, and coffee. Having dispatched it, we set off for the geysers: Dr. Webb, with his hammer and leather bags for minerals, and with boxes and bottles for small zoological specimens; Mr. Thurber, with his portfolio for plants; and I, with my sketch-book. We were all provided with pistols or rifles besides. It would have been easier and attended with less risk, to make the descent on foot; but we were obliged to go on horseback, on account of having to ford the stream. The river or creek was from thirty to forty feet wide where we crossed it, about half up the horse's middle, and very rapid. On either side, the banks were rocky and steep, rendering it somewhat difficult, though with steady animals not a dangerous passage. About a quarter of a mile from the opposite bank we dismounted, unsaddled our animals, and staked them out to feast themselves on the rich clover which there abounded, and then completed our journey on foot. A few hundred yards brought us to the first of the geysers, or "volcanoes," as they were called by our guide. I should not forget to remark, that we saw in several ravines, as we passed along, traces of former volcanic action. The rocks were bare, and in a decomposed state, showing the effects of heat or fire, although no heat was then perceptible.

At the first place we stopped, there was a show of about half an acre of decomposed granite, and other rocks, from cavities in which issued fumes of sulphur

and small quantities of steam. At these places were beds of crystallized sulphur; and in others, sulphur was exposed on turning up with a stick the exterior crust. There was every appearance around us that the rocks had been subjected to an intense heat, which was now gradually abating. After collecting specimens of the sulphur and adjacent rocks, we continued further up.

Another quarter of a mile, over steep hills and across deep ravines, brought us to the principal "geysers." Here was truly a grand prospect, and difficult to describe by one unacquainted with such scenes; for to speak with scientific precision of such a remarkable spot as this, the writer should be familiar with volcanic regions and know something of similar phenomena. The action here was confined within a narrow ravine, in the mountain side, running nearly at right angles with Pluton River, which we had crossed. The banks were from one hundred and twenty-five to one hundred and fifty feet in height, breaking in from the mountain, which rose up from ten to fifteen hundred feet above, and were wholly composed of decomposed rocks. In the chasm beneath us, columns of steam were spouting out on every side; while deep at the bottom, ran a small rivulet. Vegetation of luxuriant growth crowded close upon the crumbling rocks, consisting of various kinds of shrubbery, pines, oaks, firs, &c.

We clambered down to the spot where the *scoria* or burnt rock first appeared, and seated ourselves under the shade of a pine tree. From this point I took a sketch looking down the gorge. On each side of where we sat, some twenty or thirty feet below, a

THE MOUNTAINS

small stream came tumbling down, concealed from view by dense foliage, and united at the base of a jutting mass of rocks, as seen in the sketch. I thrust a staff, which I carried with me, some three or four feet into the crumbled granite beneath; which led us to think it not quite safe to remain where we were. From this place, we got down with some difficulty to the bottom of the gorge, where the main stream ran. The water was here cold and pure, exhibiting no unpleasant taste. A few yards further brought us into the midst of the puffing geysers, or steam-jets; for I knew not by what other name to call them. Fumes of sulphur here met our nostrils at every step, while the rustling steam, as it spouted from a hundred cavities, completely enveloped us. The latter did not issue in one continuous column, but at short intervals, as from the pipe of a high pressure engine. It was with some difficulty that we could breathe here among the fumes of sulphur and the steam; and we crouched low in the bed of the rocky stream to avoid them. In cavities along both banks, and near the running brook, was boiling water, which rose and fell, accompanied by a loud gurgling noise, resembling that of a gigantic steam condenser. In one of these cavities, stones as large as an egg were in a state of commotion, presenting a curious resemblance to a pot of boiling potatoes. I held my hand fifteen inches above this boiling pot, at which distance the water scalded it. From this cavity to the running stream, was just the width of my hand; though the surface of the boiling water in the cavity, was about a foot above the running water. The whole of this violent commotion was accompanied by a tremendous

noise beneath the earth's surface, quite equal to and resembling that made by several ocean steamers, letting off their steam through their large pipes, loud, deep, and harsh. There was no cessation to this awful roar, but one continued noise, as though a vast workshop beneath was in full operation.

The banks of the gorge were now too steep to attempt to ascend, nor would it have been safe to do so among so many jets of steam, boiling caldrons, and fumes of sulphur; so we made our way down the gorge in the very bed of the stream, jumping from rock to rock, first on one side and then on the other, and occasionally, where the stream took a leap, letting ourselves down in the best way we could. Thus we worked our way along for about an hour, filled with admiration and wonder at the mysterious workings of nature around us. The water, as we advanced, grew warmer, in consequence of accessions from the boiling cavities along its margin, until the stream became quite hot. We had here an opportunity to select a bath of any temperature, from one of icy coldness to that of one hundred and fifty degrees; and we did not fail to improve it in some of the deeper basins of the stream, which seemed prepared by nature for such a purpose.

Having thus refreshed ourselves, we clambered up the opposite bank; and as we had now passed through that portion of the gorge which had been affected by the heat, we lay down awhile under the shade of a tree on the bank of Pluton River. Looking up here, we saw before us, at the distance of a few hundred yards, another of these volcanic wonders. This was directly on the north-east bank of the stream, and was marked

GEYSERS, PLUTON RIVER, CALIFORNIA.—p. 42. vol. ii.

by a patch of decomposed rock of a whitish cast, covering about an acre. Here also jets of steam issued forth, but not in so many places, nor with as much force as within the gorge just described. Dr. Webb and Mr. Thurber examined it, and afterwards visited several others, further up the river; but none of them were found to equal the first in grandeur. I remained behind with Mr. Osborne, to take a sketch from the bank where we stood, showing these last named geysers, and the deep mountain gorge through which Pluton River runs. The scenery here was truly grand. Immense pines grew on the mountain sides and tops, while oaks and smaller trees filled the narrow valleys and ravines, which the rains had made. Just below us ran the river, dashing over rocks in its steep descent, and often concealed by the thick foliage which overhung it.

Mr. Osborne and myself then returned and crossed the foot of the gorge where the great geysers are, with the intention of getting a view of the chasm looking up towards the point from which I had taken my first sketch. To reach this point was easier said than done, and proved the most difficult and only dangerous adventure of the day. However, by lying flat on our breasts and working a resting-place or notch with our feet in the crumbling rocks, and occasionally laying hold of a projecting root, we succeeded in reaching the desired point. Here, on a projecting cliff, grew a few shrubs of the *manacita*, beneath which I crept on my hands and knees; and having reached the point, sat down and took a sketch, while my companion refreshed himself beneath the shade.

From this point is a fine view of the chasm or gorge, with the little stream at the bottom, and the jets of steam spouting from its sides. The projecting rock, near which I took the first sketch, is seen at the head of the gorge, and in the centre of the picture. Close upon the decomposed rock appears the luxuriant vegetation; while the mountain, towering far above all, forms the background.

The decomposed rocks, of which I have so often spoken, are in general of a whitish cast, curiously interspersed with spots of every hue. I noticed many patches of deep red, and some of light yellow and green; while here and there were others of black, brown, and slate color.

Having completed my sketches, we hastened back to the place where we had left our animals. Here we threw ourselves on the grass in a deep grove near the bank of the mountain torrent, to await the return of Dr. Webb, Mr. Thurber, and MacDonald. At the same time I sent my servant ahead to our place of encampment to build a fire, put on a kettle of water, and make other preparations for dinner. Within half an hour our friends made their appearance, when we mounted our nags, recrossed the river, and, after a little hard tugging up the mountain, reached our camp fire in safety, delighted with the adventures of the day.

I am not aware that this interesting spot has been visited by any man of science, except Professor Shepherd, of Western Reserve College, Ohio; and as his experience and profession better fitted him for investigations in such phenomena than mine, I quote a

portion of his remarks, which will convey a fuller and clearer idea than my feeble description. My time while there was short, and mostly spent in making sketches, and in collecting a few specimens of sulphur and of the contiguous rocks; nor had I the means of testing or examining the waters.

“You may here find sulphur water,” says Professor Shepherd,* “precisely similar to the celebrated *White Sulphur* of Green Brier County, Virginia, except its icy coldness. Also red, blue, and even black sulphur water, both cold and hot. Also pure limpid hot water, without any sulphur or chlorine salts; calcareous hot waters, magnesian, chalybeate, etc., in almost endless variety. Every natural facility is afforded for either vapor, shower, or plunging baths. Where the heated sulphuretted hydrogen gas is evolved, water appears to be suddenly formed, beautiful crystals of sulphur deposited (not sublimated as by fire), and more or less sulphuric acid generated. In some places the acid was found so strong as to turn black kid gloves almost immediately to a deep red. * * * From numerous experiments made here and in the mountains of Virginia, I am confident that all sulphur springs possess a high temperature, after descending below the cold surface water. Notwithstanding the rocks are so hot as to burn your feet through the soles of your boots, there is no appearance of a volcano in this extraordinary spot. There is no appearance of lava. You find yourself standing not in a solfatara, nor one of the salses described by the illustrious Humboldt. The rocks

* Silliman's Journal for November, 1851, p. 156.

around you are rapidly dissolving under the powerful metamorphic action going on. Porphyry and jasper are transformed into a kind of potter's clay. Pseudotrappean rocks are consumed much like wood in a slow fire, and go to form sulphate of magnesia and other products. Granite is rendered so soft that you may crush it between your fingers, and cut it as easily as unbaked bread. The feldspar appears to be converted partly into alum. In the mean time the boulders and angular fragments brought down the ravines and river by floods are being cemented into a firm conglomerate; so that it is difficult to dislodge even a small pebble, the pebble itself breaking before the conglomerate yields.

“The thermal action on wood in this place is also highly interesting. In one mound I discovered the stump of a large tree silicified; in another, a log changed to lignite or brown coal. Other fragments appeared midway between petrification and carbonization. In this connection, finding some drops of a very dense fluid, and also highly refractive, I was led to believe that pure carbon might, under such circumstances, crystallize and form the diamond. Unfortunately for me, however, I lost the precious drop in attempting to secure it.

“A green tree cut down and obliquely inserted in one of the conical mounds, was so changed in thirty-six hours that its species would not have been recognised except from the portion projecting outside, around which beautiful crystals of sulphur had already formed.”

According to the statement of MacDonald, our

guide, who had made several visits to the geysers, their activity has greatly diminished, or we saw them under less favorable auspices than usual. He said that when last here the water spouted up from five to ten feet in height; that the jets of steam were much larger and more steady; and furthermore, that a day often exhibited a material difference. That the action has lessened, and nearly ceased, is certain as respects the first one we visited; for it now appears like an expiring fire.

When Professor Shepherd visited this place, a year before us, he says that within the space of half a mile square he "discovered from one to two hundred openings, through which the steam issued with violence, sending up columns of steam to the height of one hundred and fifty to two hundred feet," * * * and again, "throwing out jets or volumes of hot scalding water some twenty or thirty feet, endangering the lives of those who stood near. In some places the steam and water came in contact, so as to produce a constant *jet d'eau*, or spouting fountain, with a dense cloud above the spray, affording vivid prismatic hues in the sunshine." With such jets of water and steam as these, the grandeur of this extraordinary spot would be greatly enhanced.

Our dinner was soon ready, and we seated ourselves on the grass again, with appetites sharpened by a long fast and a laborious tramp of nearly ten hours. Sticks of the same delicious bear's meat, and venison were placed before us, with a second course, on smaller sticks, of some fine grouse which MacDonald had shot. This was a bird I had not before seen. It was larger than the ordinary prairie fowl, and proved

delicious eating. A bath followed our repast, after which we rolled ourselves up in our blankets and lay down for the night. The novelties of the day occupied our attention for an hour, when we quietly dropped off, and slept as soundly under the protection of the spreading oak as beneath a tent or in the most luxurious chamber. These were the first nights I spent in the open air, on the bare ground, since I was taken sick near Ures; and I felt a little uneasiness at being so exposed. But I neither took cold nor suffered any other inconvenience from it, although in the month of March. One soon becomes habituated to this mode of life, and is less liable to colds and illness than when sleeping under a roof with the addition of comfortable fires.

I learned from the hunters who were with us the first night that this region abounds in game, particularly bears, elk, and deer. They had been here but three days before our arrival, and in that time they had seen no less than thirty-two bears, most of them of the grizzly species; the others of the brown and black varieties. Of these they had killed and obtained two; three they had wounded and lost. Of deer they had also killed many. The bear's sense of smelling is so good, that they soon found out our proximity, and gave us a wide berth. Deer were seen all around us.

March 24th. Our excellent guide and hunter, MacDonald, called us to breakfast at daylight; soon after taking which we mounted our animals and began the ascent of the mountain, whose summit we speedily attained. On looking at the valley beyond, we found it completely buried in a fog, the tops of the mountains alone being visible. These appeared like islands

and long necks of land in the midst of a vast body of water. While we were on the crest of the high range, a dense fog so completely enveloped us that we could see nothing but the point on which we stood. We made our way back much more rapidly than we came, it being earlier in the day and much cooler; so that by twelve o'clock we were at MacDonald's place, where we dined and allowed our animals to feed and rest.

At half-past two we bade farewell to our kind and hospitable hosts, Mr. and Mrs. MacDonald, and resumed our journey. Stopped for fifteen minutes at Mr. Knight's, when we again pushed on, and reached Mr. Kilburn's at sunset. This gentleman was now at home, and gave us a warm reception. We learned many particulars from him corroborating the statements we had heard of the extraordinary fertility of the soil in Napa Valley, as well as the great yield of vegetables on his own land, of which I have before spoken.

March 25th. Took an early start, first making inquiries of Mr. Kilburn about the locality of some hills of "black flint" which we had heard of. We had occasionally picked up along the road small pieces of obsidian, and were extremely desirous to find whence they came. After many inquiries we were directed to the farm of Mr. Kelly, who has a small mill on Napa Creek, a short distance from the road. We found Mr. Kelly at home; and on making known our wishes to examine the place referred to, he took a spade and accompanied us to the spot, about half a mile distant, on the eastern side of the valley. We found it to be a spur of the mountain ridge, about eighty feet in

height, projecting quite out into the plain. The whole seemed full of obsidian, covered with a layer of earth, on which is a thick growth of trees and shrubbery, save on the summit, where there is less soil. Here in many places the surface was covered, from six to twelve inches in depth, with broken pieces and small boulders of this volcanic substance, resembling a newly made macadamized road.

Taking the spade, I scraped away the fragments and loose pieces to reach the mass below. This we found existing in a conglomerate state. The mass in which the obsidian is imbedded is quite soft and friable towards the surface; so that it was difficult to detach it with the obsidian adhering to it, except in very small pieces. The largest of the specimens obtained was about the size and shape of an ostrich's egg, from which they diminished to that of a pea. Many presented sharp angles, where they had come in contact and been broken. The substance in which the obsidian is imbedded resembles a coarse mortar of lime, sand, and gravel. I took a sketch of Napa Valley from these hills, showing Mount Diabolo in the distance, which is plainly seen from San Francisco and Sacramento.

Obsidian is used by the Indians for their arrow-heads in all parts of North America west of the Rocky Mountains. It is found too among many tribes to the east of this range. The ancient Mexicans made of it the knives which they used in their sacrifices. We found small fragments of it along the Gila, wherever there had been any Indian villages; and also among the ruins of the Casas Grandes, in Chihuahua,

as well as those of the Gila and Salinas Rivers. The Apaches had arrows pointed with the same material. Yet I know of no other locality where obsidian is found in place in any of the regions visited by the Boundary Commission except this. All the specimens we saw were black, occasionally with a smoky or brownish tint.*

We now continued our journey, and reached Mr. Osborne's at two o'clock. After dinner we rambled over the adjacent hills to obtain a better view of this delightful valley, which lost none of its beauties from whatever point it was observed.

On the opposite side of the mountains which bound Napa Valley on the west, is Sonoma Valley. This is similarly situated, running north and south between ranges of low mountains. It likewise possesses great fertility, but has not the picturesque beauty of Napa. The same may be said of the valleys of Petaluma, Novato, and San Rafael.

March 26th. Took an early breakfast and bade adieu to our kind and gentlemanly host, who intended to follow us in a few hours. We did not wait for him, as he wished to stop on the way, and I was desirous to pay my respects to General Hitchcock and the other officers at Benicia before returning to San Francisco.

* Obsidian is said by Pliny (Nat. Hist. xxxvi. 26) to have been first found in Ethiopia by a person named Obsidius, from whom it derives its name. It occurs also in various parts of Europe, Asia, and America, and in the vicinity of most volcanoes. Pliny says that gems, and sometimes whole statues, were made of it. He also speaks of four elephants of obsidian, which were dedicated by Augustus in the temple of Concord.

As it was quite cool, we were enabled to ride fast and reach Benicia by two o'clock. Took dinner, and afterwards walked out to the military post, when I made my calls upon the officers there. Mr. Osborne joined us at five o'clock, and at seven we took the steamboat for San Francisco, where we arrived at nine.

CHAPTER XXIV.

THE QUICKSILVER MINES OF NEW ALMADEN.

Leave San Francisco—San José Valley—Fertility of the soil—Mission of Santa Clara—San José—New Almaden—Quicksilver mine—Mode of extracting the ore—Large tanks of quicksilver—Account of the quicksilver mines of Spain—Production of this metal in all parts of the world—Situation of the New Almaden mine—Descent into it—How worked—Laborers—Extent of the mine—Effect of the mercury on laborers—History of the mine—Return to San Francisco—Captain Sutter—His history.

I REMAINED in San Francisco until the 2d of April, to close up my business there before returning to San Diego. To make the most of my time while in California, I determined to undertake the journey to Monterey by land, first sending forward our outfit and supplies.

No event of interest happened while here except a trip which, in company with a small party, we attempted to make in the steamer *Active*, Capt. Alden, attached to the U. S. Coast Survey, to the Faralones. These are some small rocky islands, which lie twenty-five or thirty miles off the entrance to the Bay of San Francisco. The party, however, were so late in assembling, that after getting outside the entrance or Golden Gate, it was found we could not reach the

islands before nightfall; in consequence of which the voyage was abandoned.

April 2d. Left San Francisco at 8 o'clock in the stage for San José, forty miles distant. We were accompanied by Doctor A. Randall, a gentleman of science long resident in the country, and familiar with its localities of interest. Our course was south through the San José valley, which in many respects resembles the beautiful valley of Napa. It is entirely flat, with scarcely an undulation. Like the former, it is filled in many places with large wide-spreading oaks. There are also spaces for miles destitute of trees or shrubs, resembling the broad grassy plains of lower Texas; while again appear beautiful groves and clusters of oaks, cypresses, and sycamores, as picturesquely disposed as if planted by the hand of a skilful landscape gardener. The soil is rich, and was covered with a luxuriant growth of wild clover and grass. This valley extends for more than a hundred miles towards Monterey, being separated from the coast by a range of low mountains. Its width for a long distance after leaving San Francisco is not less than fifteen miles, though it diminishes as we approach San José. Yet this entire valley has all been taken up, and covered with claims upon claims; so that for many years to come the lawyers will doubtless derive the largest income from it. As yet there are few settlers upon it, and but little land under cultivation. When we take into consideration the extraordinary fertility of the soil in California, it will be seen that such an immense tract as this San José valley is capable of producing a vast deal towards supplying the State with food. Its

GOLDEN GATE AND FORT POINT. ENTRANCE TO SAN FRANCISCO.—p. 54. vol. ii.

value is justly appreciated by the people; as is shown by the readiness with which the stock for a railroad to connect San José with San Francisco was taken up.

The road is excellent for the entire distance, and the stage rolled rapidly over it. Three miles from San Jose we passed the mission of Santa Clara, a collection of old buildings with a church. Here the land seemed to have been long under cultivation, judging from the long rows of venerable and gigantic overgrown oaks which border the road. There were also some fine large orchards and vineyards here, which belong to the mission. But the stage did not stop; and we had no time to examine it. At half-past four, we reached San José.*

* I cannot refrain from quoting a passage from Vancouver, one of the most reliable of the early voyagers to California, giving an account of his journey from Monterey to Santa Clara. The reader will be struck with the resemblance between this district as described by him and the beautiful valley I visited north of San Francisco.

"We considered our route to be parallel to the sea-coast; between which and our path, the ridge of mountains extended to the south-eastward; and as we advanced, their sides and summits exhibited a high degree of luxuriant fertility, interspersed with copses of various forms and magnitude, and verdant open spaces enriched with stately fruit-trees of different descriptions. About noon we arrived at a very pleasant and enchanting lawn, situated amidst a grove of trees at the foot of a small hill, by which flowed a very fine stream of excellent water. We had not proceeded far from this delightful spot, when we entered a country I little expected to find in these regions. For about twenty miles, it could only be compared to a park which had originally been planted with the true old English oak; the underwood that had probably attained its early growth, had the appearance of having been cleared away, and had left the stately lords of the forest in complete possession of the soil, which was covered with luxuriant herbage, and beauti-

Santa Clara was but recently occupied by a priest ; it has now shared the fate of all the other missions of the State, which have either been abandoned or have fallen into the hands of speculators.

April 3d. After breakfast, walked about the town, but found nothing of interest. The pueblo of San José, is an old place ; its admirable situation, at the head of the rich and beautiful valley I have described, attracted the attention of the Americans soon after the subjugation of the country, and it was selected as the capitol of the State. This gave to it an impetus, and brought it at once into notice. Many hotels and other buildings soon sprang up, a large city was laid out, and, as is usual in such cases, much money was made and lost. But its growth was as suddenly checked by the subsequent selection of another place for the future capitol. It is situated about five miles from the southern extremity of the Bay of San Francisco ; and being in the centre of one of the most fertile districts in the State, it will yet become its first agricultural town.

On inquiring for Indians here, I learnt that there was a woman of the *San Luis Obispo* tribe, living in the place. I lost no time in calling upon her, and found she was married to an American. She proved, as I had heard, to be quite an intelligent person, about 35 years of age, living in a comfortable house with her family around her. On my requesting to know the principal

fully diversified with pleasing eminences and valleys ; which, with the lofty range of mountains that bounded the prospect, required only to be adorned with the neat habitations of an industrious people, to produce a scene not inferior to the most studied effect of taste in the disposal of grounds."—*Vancouver's Voyages*, vol. ii. p. 16.

words of her language, she readily complied; and in a few hours, I obtained a most satisfactory vocabulary.

In the afternoon, we took the stage for New Almaden, thirteen miles distant. Our route lay through a valley of unequalled beauty, the entire distance being dotted with large oaks and sycamores, with an occasional clump of firs and red-woods, the latter towering high above all others. There are some clusters of these red-woods of enormous size between here and Monterey, of which we heard much, and regretted that we had no time to visit them. On reaching the town, I drove at once to the house of Mr. Young, the superintendent of the quicksilver mines, to whom I had a letter of introduction from Captain Hallock, U. S. A. of San Francisco, one of the officers of the Company.

April 4th. New Almaden consists exclusively of the buildings belonging to the company which owns the quicksilver mine. It embraces furnaces, store-houses, dwelling-houses for the officers and laborers, offices, mechanics' shops, &c. Many of them are of wood; but a large and fine range of substantial brick buildings is now in the process of erection, to take the place of the wooden ones. The novelty of the business of extracting the quicksilver from the cinnabar, required a number of experiments, involving a very heavy expenditure; for there was but one other mine in the world, that of Almaden in Spain, where the operation was carried on on a large scale, and it could not be expected that a rival company like this, whose operations would effectually destroy the monopoly the latter had for ages enjoyed, would be permitted to derive any information from their long experience. Machine-

ry of various kinds was therefore imported from England and the United States at enormous cost, much of which has since been rejected, either on account of the great expense of running it, or its inadequacy to perform the service required. Six furnaces are now in operation reducing the ore, all of which seem to be alike, and of the most simple construction. On these furnaces the ore is heaped. A steady, though not very strong fire, is then applied. As the ore becomes heated, the quicksilver is sublimed; and then being condensed, it falls by its own weight, and is conducted by pipes which lead along the bottom of the furnace to small pots or reservoirs imbedded in the earth, each containing from one to two gallons of the ore. The furnaces are kept going night and day, while large drops or minute streams of the pure metal are constantly trickling down into the receptacles. From these it is carried to the store-house, and deposited in large cast-iron tanks, or vats. These are of various shapes and sizes, and are fixed in solid beds of stone and mortar. The largest, a square vat between four and five feet across, contained twenty tons of pure quicksilver. By way of illustrating the great specific gravity of this metal, a board was placed on it, upon which I sat, thus floating upon a bed of quicksilver; yet my weight did not sink the board to the depth of a quarter of an inch. On thrusting my bare arm into this vat, a most singular and chilling sensation was produced. I then took a stick of light and porous wood, which I immersed for about a minute; and when I withdrew it, the metal had penetrated through every portion of it, so that in weight it was little less than the quicksilver itself.

QUICKSILVER FURNACES, NEW ALMADEN, CALIFORNIA.—P. 58. vol. ii.

In the warehouse the metal is prepared for market. This is done by putting it into wrought iron flasks or canisters holding 75 pounds each. It is dipped up with ladles, and poured into the flasks through an ordinary tin funnel. The opening or neck of the flask (which in form is something like a junk bottle) is then stopped with a close-fitting screw, put in with a vice, so as to make it tight as possible. These flasks, which weigh twenty-five pounds each, are all made in England, where I suppose they can be furnished much cheaper than in the United States. From the warehouse the flasks are transported by ox-carts to tidewater, about twenty miles distant, whence they are shipped to San Francisco. The present (1852) price of the metal there is sixty cents a pound, a very great reduction from that which the quicksilver from Spain has commanded, though of equal quality. A shipment of a thousand flasks was lately made to Canton, by way of an experiment. In China it is chiefly used in the manufacture of vermilion and other articles of commerce.*

* As this is the only quicksilver mine yet known in the United States, and is only second in the world to that of Almaden, in Spain, a few words on the latter, and of other quicksilver mines, do not seem inappropriate.

Quicksilver, or mercury, has been known from the earliest ages, but is found nowhere in large quantities, except in Spain and California. Almaden has long been famed for its mines of this metal, which, according to Bowles, are the richest in their produce, the most instructive as to the mode of working them, the most curious for their natural history, and the most ancient in the world. We find them mentioned in Theophrastus, three hundred years before Christ, and Vitruvius also speaks of them. Pliny places Cisapona, or as it is sometimes written Sisapona,

I did not learn what quantity was produced at the time of my visit here, but have since seen it stated to be about one thousand flasks per month, or nearly a million pounds a year. According to Dumas, the an-

in Bætica, and says that this mine was kept sealed with the greatest care, and was only opened to take the quantity of cinnabar necessary for the consumption of Rome. (Nat. Hist. xxxiii. 7.) The Romans considered this mineral poisonous; but notwithstanding this, their matrons painted their faces with it, and their painters employed it as a pigment. The Romans certainly worked this mine, but no traces remain of their labors. The Moors, perhaps owing to some prejudice, did not work it.

“The country about Almaden abounds in iron mines; and what is more surprising, in the same mine we find iron, mercury, and sulphur, mixed so as to form one mass. The neighboring hills are found of the same stone, and on all of them the same species of plants grow; from which we may infer that the mercury does not possess any poisonous qualities, as is generally supposed, injurious to vegetation.

“The brothers Mark and Christopher Fugger, of Germany, undertook to work this mine, and contracted to give the government four thousand five hundred quintals (of 100 lbs. each) of mercury, annually; but not being able to fulfil their promise, they abandoned it in 1635, together with the silver mine of Gualcanal, which they also had. While connected with these mines, however, their riches became proverbial in Spain, and their descendants live at present in Germany, with the rank of princes. A branch of this family afterwards took the mine, and worked it till 1645. In the following year, the government undertook the management of it. Don Juan Bustamente established the furnaces, and also troughs for cooling the mineral. These furnaces are twelve, and are called by the names of the twelve apostles. Each is capable of containing ten tons weight of stone. The furnace is kept burning for three days, and the same period is required for cooling.”—*Introduction á la Geografica Fisica y la Historia Natural de España.*

The other quicksilver mines worthy of notice, are one at Huancavelica, in Peru; at Idria in Carniola; in Hungary, Transylvania, and the district of Deux Ponts in Germany. There is a mine of cinnabar near Alicante, and another not far from San Felipe in Spain. Mercury has

nual product of the Spanish mine at Almaden is about three millions of pounds.

April 4th. After breakfast we set out on foot for the mine, which is situated near the top of a mountain immediately adjoining the works. The ascent begins directly in the rear of the store-houses, by a well con-

also been found in China and Japan: and though the amount of the produce is unknown, it is believed to be considerable.

Le Play, a French geologist, who visited Almaden in 1833, describes the mines as being richer than at any former period, furnishing annually nearly 2,244,000 pounds of mercury. About seven hundred workmen are employed under ground, and two hundred in the operations connected with extraction of the metal from the ore at the surface.

According to Dumas, the following mines yield annually, the annexed number of quintals of mercury (a quintal is 108 lbs. avoirdupois, nearly):

Almaden (Spain)	25,000	to	32,000.
Idria	6,000	"	10,000.
Hungary	} 700	"	900.
Transylvania			
Deux Ponts	400	"	500.
Palatinate	180	"	200.
Huancavelica	3,000	"	3,000.

At present, it is understood that Messrs. Rothschild, of London, have the control of the Almaden mines.

During the year 1853, the total exports of quicksilver from San Francisco, amounted to 18,800 flasks, valued at \$683,189. All this, together with the large amount used in California, was the product of the New Almaden mine. The following shows to what points the quicksilver was exported: "Hongkong, 5,642 flasks, valued at \$180,272; Shanghae, 812, \$31,199; Canton, 366, \$14,125; Whampoa, 300, \$11,500; Calcutta, 50, \$1,875; Mazatlan, 2,811, \$96,250; Mazatlan and San Blas, 255, \$10,000; San Blas, 1,942, \$72,463; Callao, 1,800, \$66,500; Valparaiso, 1,977, \$71,875; New-York, 1,845, \$77,180; Philadelphia, 1,000, \$50,000."

structed road of gradual and easy ascent, which the Company has been engaged in making for the last six months. It is a mile in length, and is now only used by mules; but it is intended to use carts and wagons on it. It winds the whole way along the side of the mountain, rising twenty-five feet in every hundred until you reach the mouth of the mine, at an elevation of a little less than one thousand feet above the commencement of the ascent.

About one hundred and fifty feet, in a direct line below the opening, they were digging a tunnel for the purpose of intersecting the main shaft. This tunnel, which is cut entirely through the solid rock, had already pierced the mountain seven or eight hundred feet, and will, when completed, be not much short of one thousand feet. It is about eight feet high, and between eight and ten feet wide. This will prove a vast saving in labor; for the ore up to the time of our visit was transported on the backs of men in leather sacks from the bottom of the shafts to the entrance to the mine, a distance of from two hundred and fifty to three hundred feet. It is not the cinnabar alone that has to be thus carried from the bottom of the mine, but the refuse rock, which forms a greater bulk than the ore itself. It cannot be separated in the mine, but has all to be brought to the surface.

We waited for Mr. Bester, the engineer, to join us before entering the mine; and as he had not returned from San José, where we left him, we determined to forego the examination of its interior to-day, and content ourselves with what we could see on the surface.

The mountain rises one hundred and sixty feet above the entrance to the mine, terminating in a cone. On a level with the entrance, a quarter of a mile distant, is the village, perched on the very summit of a rock, in which the miners live with their families. This mountain, as well as the others adjoining it, is covered with grass, and dotted with small oaks to its summit. There is nothing to distinguish the mountain in which the mine is worked from the others; hence it is reasonable to suppose that they may also contain veins of cinnabar. The intervening valleys are well wooded, and have a thick undergrowth.

April 5th. Set out this morning for the mine, accompanied by Mr. Bester, on mules, as the journey up was fatiguing, and we wished to preserve our strength for the exploration of the various shafts. On reaching the entrance, we found all actively employed;—the laborers emerging every minute from the mines, bent under the weight of their loads, which they deposited under a shed about eighty feet from the opening. Here the ore was separated, the refuse being thrown down the hill, and the rest laid aside to be sent to the furnaces. At the same time the *mulada*, or collection of some eighty or a hundred mules, was being loaded with the ore. This was put into sacks or panniers of raw hide, which hung across their backs like saddle-bags, each mule carrying on an average a *carga*, or three hundred pounds. Men stood by with a balance, in which every mule load was weighed, so that the exact quantity of ore sent to the furnaces is known. The weighing is also necessary; as the company pays so much a *carga* for bringing it

from the bottom to the surface, and for transporting it from the mine to the furnaces. This plan is preferred by the proprietors to that of employing the laborers directly themselves. The work is wholly performed by native Mexicans or Californians, the overseers and contractors who employ them being their countrymen, though of a better class. These men understand the management of their countrymen better than Americans do; and the Mexican laborers are better arrieros, and understand all that appertains to the mule better than Americans.

The laborers wore no clothing, save a breech-cloth, and a handkerchief around their heads. The arrieros had on but little more; a fancy colored calico shirt being the extent of their additional costume. The laborers who bring up the ore to the surface make from forty to fifty trips a day. The mules make but two journeys from the mine to the furnaces, completing their day's labor by one o'clock. They are then turned out to feed in the valley or on the mountain side, where the grass is good. With so little labor, they are always in fine condition. About two hundred men are employed in the various operations carried on here.

After being provided with torches, consisting of a candle fastened to the end of a stick, we commenced the descent of the mine, Mr. Bester, the engineer, taking the lead. We first advanced some sixty feet in a horizontal direction, after which the shaft takes a turn downwards, and soon after becomes perpendicular. In such places the descent is made on a single notched log, which is preferred by the miners to the

common ladder; and although very awkward at first, we soon got used to it. With one hand you take hold of the ladder, and with the other the torch. These ladders, although almost perpendicular, are seldom more than twelve or fifteen feet long, being separated by intervals, where the descent is more gradual, with steps cut in the rock. In this way we passed down through various shafts or veins to the bottom of the mine, two hundred feet below the entrance. Passages following the veins of ore extend in every direction, sometimes horizontal, then perpendicular, and again at every inclination. Their whole extent now exceeds seven thousand feet. When a vein is struck, it is followed as far as it can be with safety, whatever may be its course. The engineer, who keeps before him a map of the mine, is obliged to have an eye to the support of the superincumbent mass. Some of the veins are five feet in diameter, others half that size. Some are also richer than others.

In each of the veins is a single miner; for not more than one can work to advantage in these narrow recesses. Picks, drills, and crowbars are the tools used. The miners are paid in different ways; some at a stipulated price for each foot of the rock excavated, and others at a certain rate per carga (three hundred pounds) of ore carried to the surface. On reaching the greatest depth, where the ore is very rich, I took a pick and knocked off some fine specimens. We now retraced our steps, and reached the open air in safety.

It is an evidence of the admirable system pursued here, and the watchful care exercised by the company over their employees, that no accident has yet happened.

to any miner or carrier engaged in these subterranean labors. The workmen, nevertheless, are not without their fears, and have taken their own method to secure themselves from harm, by placing in a niche just within the entrance to the mine, an image of their saint, very prettily decorated with muslin and gaudy silks. Before this every man falls on his knees, and says his prayers, invoking the protection of the saint during the day. I have never seen a more happy and contented set of laborers than these.

Knowing the effects of mercury on the system, the question will naturally arise in the mind of the reader as to whether those employed in the mine or about the furnaces suffer from their close contact with the ore or the quicksilver. The miners, and those who merely handle the cinnabar, are not injured thereby; but those who work about the furnaces, and inhale the fumes of the metal, are seriously affected. Salivation is common; and the attendants on the furnaces are compelled to desist from their labor every three or four weeks, when a fresh set of hands is put on. The horses and mules are also salivated; and from twenty to thirty of them die every year from the effects of the mercury.

The ore, after it is deposited near the furnaces, is separated according to its quality. The larger masses are first broken up, and then all is piled up under sheds near the furnace doors. Seven or eight days are required to fill the furnaces, extract the quicksilver, and remove the residuum, the latter being the most dangerous part of the process. All is done as much in the open air as possible, the furnaces being merely protected by a roof.

I took several sketches of the village of New Almaden, as well as of the exterior of the mine, and the picturesque scenery in the vicinity. The company possess a large tract of land here, including mountain, hill, and valley. Much of it is well timbered. A fine stream of water runs directly through the village; and on its very margin is a natural soda spring, which may yet make this spot doubly attractive.

This mine was long known to the Indians, who resorted hither for the vermilion which they could collect from the cinnabar. They had dug some thirty or forty feet into the mountain; but it does not appear ever to have been worked by the Spaniards. In recent times, its commercial value was first discovered by Señor Castellero, who became its legal owner. Don José Castro, who subsequently became proprietor of it, sold out his interest to Barron & Forbes, an English house doing business in Mexico. Another partner is Mr. Walkinshaw, an English gentleman long resident in Mexico, and well skilled in mining. This gentleman now resides about a mile from New Almaden, on one of the natural parks which I have before described, and which he is rendering still more beautiful by the introduction of fruit-trees, vines, flowering shrubs, etc. To this gentleman, to Mr. Young, the superintendent, and Mr. Bester, the engineer, I feel under many obligations for the civilities extended to me and the gentlemen who were with me, in our visit to New Almaden and its mine. After a sumptuous dinner, we took the stage and returned to San José.

April 6th. In coming to San José, I had the double object in view of visiting the quicksilver mine, and of

continuing on by land to Monterey ; but I here learned that it would be impossible to proceed further by land, as the heavy rains and freshets a few weeks before, had carried away the bridges, and rendered the streams impassable, except by swimming the horses. This I did not feel disposed to do : so the only alternative was to return to San Francisco, and go to San Diego by water. We accordingly took the stage at 8 o'clock, with twenty-one passengers inside and out ; and reached San Francisco at 4 o'clock in the afternoon.

I remained in San Francisco six days, waiting for a steamer to San Diego ; and during this time I had the pleasure of meeting with Captain Sutter, whose name is well known to all who have heard or read of the recent history of California. The history of his early adventures has been on several occasions presented to the public by letter-writers ; so that it will be superfluous at this time to relate them, excepting the following anecdote, which I have not seen in print.

“ While in Oregon, whither he had come from the United States, Captain Sutter met with a party who gave such a glowing account of California and particularly of the valley of the Sacramento, that he determined to visit it, believing it to be precisely the rich country and salubrious climate of which he was in search. But to get there was not so easy, there being then no communication from Oregon by sea. He therefore shaped his course for the Sandwich Islands, and from thence to Mexico. At San Blas or Mazatlan, he found a vessel about sailing for Monterey ; he embarked in her, and afterwards reached the Bay of San Francisco, nearly twelve months after leaving Oregon. But the country

he was in search of was a perfect *terra incognita* even to the people who then composed the settlement at Yerba Buena; nor could he gain any information respecting the river which led to it, or even as to where it entered the bay. His scheme of settling in the interior among the wild Indians, was considered a dangerous one, and efforts were made to dissuade him from it; but he had made up his mind to go, and accordingly got a small boat and set off with a few men to find the Sacramento River. They coasted along the bay in vain for several days, and were about to abandon their search, when one night as they were moving slowly along by moonlight, Captain Sutter himself discovered an opening which proved to be the mouth of that river. He passed up it, and selected the spot where he built his fort, and of which he afterwards obtained a grant from the Mexican government."

When we hear of the pioneers of the West, we imagine them to be such as our Daniel Boon, who led the life of a hunter, trapper, and Indian fighter, until his home was surrounded by settlers, when he again moved farther off, desiring always to be beyond the pale of civilization. Captain Sutter was not of this class; although he has had his share in fighting the battles of Europe, as well as encountering the Indian on the prairie. He has the manners of an intelligent and courteous gentleman, accustomed to move in polished society. He speaks several languages with fluency. He is kind, hospitable, and generous to a fault; as very many Americans know who have lived on his bounty. Had he been permitted to retain his immense estate on the Sacramento, and dispose of it as wanted by actual set-

tlers, he would have been one of the richest men in America; but speculators took advantage of his easy disposition, led him into wild speculations, induced him to lend his name to a large amount, and thus extorted from him or compelled him to give up all of his valuable property, but the Hock farm, where he now resides. He still seems cheerful, and endeavors to make the most of his misfortunes. When I saw him, he told me he had not visited San Francisco for a year.*

* Captain Sutter is a native of Switzerland, from 55 to 60 years of age, and of fine personal appearance. He was one of the officers of the Swiss Guard in the Revolution of July, during the reign of Charles X. After this he emigrated to the United States, became naturalized, and resided several years in Missouri. From thence he went overland to Oregon, and in 1839 reached California. He bought out the Russian establishment at Fort Ross and Bodega, when the Russians abandoned their settlement in California. His fort on the Sacramento was a large inclosure, five hundred feet in length by one hundred and fifty in breadth, where he had under his control a body of Indians, whom he employed in cultivating the soil. After obtaining his large grant from Mexico, that government made him military commander of the frontier.

CHAPTER XXV.

RETURN FROM SAN FRANCISCO TO SAN DIEGO.

Leave San Francisco—Monterey—Its harbor—Society—Californian ladies—Father Juniper Serro's account of Monterey in 1770—Visit to the Mission of San Carlos at Carmel—Father Garces' visit in 1777—Leave Monterey—Point Conception—San Pedro—Visit to Los Angeles—Rich prairies—Large herds of cattle—Vineyards and wines—Indians of the Missions—Mission of San Gabriel—Return to San Pedro—Craw fish—Arrival at San Diego—Preparations for return to El Paso—Engage Mr. Leroux as guide—Trip to Los Coronados—Description of these islands—Sea Lions—Climate of San Diego—Visit to the Mission of San Luis Rey—Extensive buildings—Fine Valley—Kechi Indians—History of Father Peyri—Description of the harbor of San Diego—Viscaino's account of San Diego in 1602—Father Juniper Serro's account in 1769—Mission of San Diego—Picturesque situation—Fine lands—Olive trees—Society of San Diego—Initial Point and monument on the Pacific.

ON the 14th of April I embarked in the steamer Ohio for Monterey, at which place I intended availing myself of a polite invitation given me by Captain Ottinger, of the United States revenue cutter Frolic, to take passage with him for San Diego. His duties required him to stop at the various ports between the two places, which would give me a better opportunity to see the country than by remaining on board the steamer. We went to sea at five P. M. with a large number of passengers, and, having but little wind,

shot rapidly through the "Golden Gate." Outside it was so calm, that the broad surface of the Pacific resembled an ocean of glass.

April 15th. Reached Monterey at eleven, A. M., where I found Captain Ottinger with his beautiful little craft.

The coast between San Francisco and Monterey presents nothing but low sandy hills, covered with chapporal or scanty verdure. Large quantities of sand are blown up from the sea, and in many places overtop the vegetation.

On coming to this place from San Francisco, one is struck with its remarkable dulness; yet until the discovery of gold in the country, it was the chief place on the coast, and the capital of California. Many of its houses are now deserted, or in a dilapidated state, and the grass may be seen growing in its streets.

The town is prettily situated on a gentle slope of land, facing the north, about two miles from Point Pinos, which forms the southern extremity of the harbor or roadstead. The harbor is not a good one, being exposed to the prevailing north-westerly winds, and exhibiting a long beach, with as troublesome a surf as the open sea. From the southwesters it is well protected by Point Pinos. On the east is a succession of small hills, rising one above the other directly from the slope on which the town stands, and covered chiefly with pines. Behind, and immediately contiguous to these, rises the coast range of mountains. On the north, the bay makes a broad semi-circular sweep some fifteen or twenty miles distant, terminating at a point

MONTEREY, CALIFORNIA. — p. 72. vol. ii.

on the ocean opposite to, though far outside of, Point Pinos, and not visible from the town. The houses are of two classes; first, those of adobe, belonging to the old town. These are large and well built, many being of two stories, with projecting eaves to protect them from the sun. Those of wood are of recent erection, and have not the substantial appearance of the adobe buildings; these latter have very thick walls as a security from the earthquakes, which, though not severe, are quite common here. An old church stands alone upon the plain east of the town, which appeared to be in a ruinous condition. Beyond this is a lagoon, said to have been formerly connected with the bay, but now separated from it by a sandy beach, and a grassy meadow, about a quarter of a mile in width. The old presidio, or garrison, is on an elevation back of the town, towards Point Pinos, and is now occupied by United States troops.

Monterey has always been noted for its excellent society; and although the Americans have monopolized every other town in the State, it still preserves much of its original character. The old Californian or Castilian families are still in the ascendancy; but the young Americans and other foreigners are making terrible inroads upon them, and carrying off their fair daughters. Many officers of the United States army have married in California; and from what I heard, here and at other places, others intend following their example. The young señoritas certainly possess many attractions; and although shut up in this secluded part of the world, without the advantages of a good education, or of intercourse with refined society, they

need not fear a comparison with our own ladies. In deportment they are exceeding gentle and ladylike, with all the natural grace and dignity which belong to the Castilian nation. Their complexion is generally as fair as the Anglo-Saxon, particularly along the sea coast, with large black eyes and hair. In this respect they differ much from the Mexican ladies of the interior, who are generally brunettes. In form too they differ from their Mexican sisters. The latter are too often short and stout, while the Californian ladies are as slender and delicate in form as those of our Atlantic States. I was struck too with the elegance and purity of their language, which presented a marked contrast with the corrupt dialect spoken in Mexico.

The Californians as a people appear superior to the Mexicans, which may be attributed to two causes. Both countries, it is true, were colonized by the same race; but I think a superior class of men came to California, who have preserved their Castilian blood from all admixture with that of the aborigines. There were, doubtless, fewer of the poorer class too who came here, owing to the greater length and cost of the journey, and the increase by immigration has been trifling since. The original colonists possessed large tracts of lands, and have ever since continued in an isolated state, marrying among themselves, and enjoying a life of luxury and ease. The climate, unlike that of Mexico, is healthy and invigorating; while the humid atmosphere of the coast gives a fairness and brilliancy to the complexion unknown to the dry and burning plains of Mexico.

Although San Francisco will always rank first in

the scale of Californian cities, by reason of its superior harbor and great commercial facilities, Monterey will become the residence of gentlemen of fortune, on account of its more genial climate and its distance from the noise and bustle of a great city. It will be to San Francisco what Newport is now to New York.

The following account of Monterey was written by the Reverend president of the California missions, F. Junipero Serra, to his biographer, Father Palou, in a letter announcing his arrival at this place. It appears that an expedition sent by land to Monterey failed to reach it, but found San Francisco; and that subsequently two other expeditions, one by land the other by water, were sent in search of it. In the latter of these was Father Junipero. He thus writes:*

“ Long live Jesus, Mary, and Joseph!

“ Reverend Father, Professor, and President, Fr. Francisco Palou:

“ My dearest Friend and Sir:—On the 31st of May, by the favor of God, after a painful voyage of a month and a half, the packet San Antonio, commanded by Don Juan Peres, arrived and anchored in this horrible port of Monterey, which is the same, unaltered in appearance and condition, that it was when visited by the expedition of Don Sebastian Viscayno, in the year 1603. It gave me great satisfaction to learn that eight days previous the land expedition had arrived, and with it Father Juan, and that all were in good health. When the holy day of Pentecost arrived,

* *Relacion Historica de la Vida y apostolicas Tareas del padre Fray Junipero Serra, por Fr. Francisco Palou, p. 101. Mexico, 1787.*

which was on the 3d of June, the whole of the officers, naval as well as military, and all the people, assembled together in a small ravine, where the Fathers caused an altar to be erected, and the bells to be rung. They then chanted the *Veni Creator*, blessed the water, erected and blessed a grand cross and the royal standards, and chanted the first mass that was ever performed in this place. We afterwards sung the *Salve* to our Lady, before an image of the most illustrious Virgin, which occupied the altar, and then I preached a sermon. We concluded the festival with a *Te Deum*. After this the officers took possession of the country in the name of our Lord the King, whom God preserve. We all dined together in a shady place on the beach; the whole ceremony being accompanied by many volleys and salutes, on the land as well as from the vessels. To God alone be the honor and glory!

“With regard to the former expedition, its not finding the port of which it was in search, and having asserted that it did not exist, I will express no opinion, and will not judge of their motives. It is enough to say, that it has been found, and the duty performed, although rather late. This I desire may be made known to the Visitor General, and to all those who feel an interest in this spiritual conquest.

“Mission of San Carlos de Monterey. June, the day of San Antonio Padua, 1770.

“I kiss your hands, etc.

“FR. JUNIPERO SERRA.”

April 16th. This morning I got a horse and rode out to the Mission of San Carlos, on the river Carmel,

four miles from Monterey. The ride was a delightful one over gentle hills, and through valleys with beautiful grassy slopes, thickly wooded with pine, fir, and oak trees. The whole country about Monterey presents a most pleasing prospect to the eye, after seeing the parched and barren hills along the coast.

The Mission establishment, which consists of a church and the usual accompaniments of a large inclosure with ranges of small buildings, stands upon a little elevation between the hills and the sea, from which it is distant only a few hundred yards. The church which is built of stone, has two towers, containing six bells; its walls are very thick, with an arched roof, and supported by heavy buttresses. The towers, as usual, differ. The adobe buildings near, were all in a state of ruin, and tenantless; not a human being was to be seen near, while the rank grass and weeds which monopolized the ground, showed that even curiosity did not often tempt visitors to its deserted precincts. One corner of the church began to show the ravages of time: its cornice had fallen, and weeds had already taken root among its opening crevices. The remains of an orchard and vineyard, are still seen near, in a decaying state. Small pine trees cover the hills within a short distance of the church; and on its other side, the ocean rolls up its waves with a dull monotonous sound, which adds to the solitary feeling of the place.

Near by, the river Carmel, a diminutive stream, to which the appellation of brook would be more appropriate, emerges from a valley between two high ranges of grass-covered hills, and falls into the sea. Up this valley I noticed ploughed fields and ranchos; beyond

it higher mountains arise, completely shutting in the river on the East.

This Mission was for some time the residence of the Fathers Juniper Serra, and Francisco Palou, two of the most distinguished of the early Catholic missionaries in California. When Father P. Font arrived in Monterey, in 1777, from Sonora, in Mexico, with a body of men to strengthen the Colony at that place, he says the "Father President, F. Junipero Serra, with four other priests, came from the mission of San Carlos to welcome us, and we chanted mass in thanksgiving for our safe arrival;" and it "was determined that we should go to the mission of Carmel, as there were no lodgings for us here."*. . . He states that there were seven priests at the mission, that it was "an excellent spot, and the land very fertile."

April 17th. Set sail from Monterey in the U. S. revenue cutter Frolic, Captain Ottinger. The wind was ahead and light; so that by dark we were scarcely beyond Point Pinos, so named from the pines which grow upon it, and which distinguish it from the barren head-lands on the Californian coast.

April 18th. At sea. With a fresh breeze from the north-west, we scudded along finely. It is necessary to keep at a distance from the land, as there are no light-houses on the coast.

April 19th. Hailed the Pacific mail-steamer Northernner as she passed us, and put letters on board for the United States, as we should be too late for the mail at San Diego. Towards evening the winds died away,

* Manuscript Relation, in the possession of the author.

leaving us within a quarter of a mile of Point Concepcion. This is a plateau extending a couple of miles beyond the coast range of mountains. Saw two or three ranchos, surrounded by clusters of trees, and large numbers of cattle grazing upon the declivities of the mountains and upon the plain, which, to judge from its brilliant green hue, was covered with rich grass. In the night, the wind came around from the north-east with a thick fog.

April 20th. The northern point of the island of Santa Rosa, bore south six miles. Light winds and calms during the day. At 2 P. M. the steamer Active, of the Coast Survey, passed us. At nine, saw a light ahead and pursued it for an hour or more, thinking the vessel it was in might prove a smuggler. Finally came up with and hailed her; when she was found to be a small craft bound to the islands in search of sea-lions, which abound there, and are taken for the oil they furnish.

April 21st. Light winds during the day, with fog and haze. Could discover no current. Reached San Pedro at 9 P. M., and came to anchor. The wind blew quite fresh from the north-west during the night.

April 22d. San Pedro is an open bay or roadstead, about fifteen miles across from the two points which bound it, and scarcely deserves the name of a harbor. It is exposed to the prevailing winds, and affords no protection save on the east and north. When caught with a southerly gale, vessels are obliged to stand across to the islands of Catalina, twelve miles distant, for safety. It is the Port of Los Angeles, twenty-nine miles distant, and contains but two houses. These are quite

large, being used as warehouses for merchandise, as well as for dwellings. Vessels stop here for water, which has to be carted from a distance of three miles. Many also provide themselves here with beef, which is furnished at a less rate than at other places.

I was desirous to visit Los Angeles for the purpose of buying mules, which were scarce and high at San Diego. Soon after breakfast I went on shore with Captain Ottinger, and we both took the stage then about to start for Los Angeles. There were twelve passengers to go, who filled two ordinary lumber wagons, each drawn by four mules. On leaving the coast, the road was somewhat hilly for a few miles. Passed several lagoons about three miles from San Pedro, in which were large numbers of ducks, plover, curlew, and snipe, embracing varieties which I had not before seen; on leaving these, we entered upon a broad plain, which extended as far as the eye could reach, unbroken by hill or tree. This plain, the surface of which was slightly undulating, was covered with luxuriant grass and clover; and sometimes a patch of yellow mustard, growing to the height of five or six feet, filled a space of a mile or two. Flowers of brilliant hues were thickly scattered over the plain, giving it here and there a tinge of purple, orange, or yellow. In every direction, the eye fell upon large herds of cattle and horses luxuriating on the rich grass; so numerous were they, that at one time there could not have been less than ten thousand head in sight.

It was here that a skirmish took place between Commodore Stockton, or a party sent by him, and the Californians; but from what I could learn, it was little

more than a running fight, in which no great harm was done by either party.

We reached "La Ciudad de los Angeles," the City of Angels, at 4 o'clock, and put up at the "Bella Union," a very indifferent hotel. At the most miserable tavern in the back woods, I have found better accommodations than at this place.

After dinner, I called at the office of the "Los Angeles Star," to obtain a file of the paper, which contains a series of articles on the Californian Indians. Mr. Rand, one of the editors, cheerfully complied with my request, and gave me the papers I desired. I also met Mr. Hayes here, a gentleman connected with the bar, who, with Mr. Rand, manifested much interest in the objects of my inquiry; and Mr. Hayes kindly offered to accompany me to the mission of San Gabriel, twelve miles distant, where resided Mr. Hugo Reid, the author of these papers. These gentlemen informed me that Mr. Reid was better acquainted with the Indians of that portion of the State than any other person. With the hope therefore of obtaining more information on this subject, I gladly accepted the proposal of Mr. Hayes; and we agreed to set off for the Mission as soon as horses could be procured.

After waiting two hours, the horses promised Mr. Rand were still not forthcoming; we were therefore compelled to give up our ride this afternoon, and postpone it until morning. I regretted this, as I had intended to pass the evening at the Mission, and return in the morning in time to take the stage back to San Pedro. The horses were promised to be saddled and at the door by 5 o'clock in the morning.

Spent the hour that remained before dark in walking over the hills with Mr. Hayes. Los Angeles is situated in one of the finest agricultural districts in the State. It has at various times contained from fifteen hundred to two thousand inhabitants, and was formerly a place of much wealth. There are many large haciendas and ranchos in the valley, which is in a high state of cultivation, abounding in orchards and vineyards. Judging of the wine I saw, and the imperfect mode followed in producing it, there is no doubt that an article of superior quality might be made here in abundance.

I saw more Indians about this place than in any part of California I had yet visited. They were chiefly "Mission Indians," i. e. those who had been connected with the missions, and derived their support from them until the suppression of those establishments. They are a miserable squalid-looking set, squatting or lying about the corners of the streets, without occupation. They have now no means of obtaining a living, as their lands are all taken from them; and the missions for which they labored, and which provided after a sort for many thousands of them, are abolished. No care seems to be taken of them by the Americans; on the contrary, the effort seems to be, to exterminate them as soon as possible. One of the most intelligent of them, who was brought to me by the kindness of my friends here, was unacquainted with the name of the tribe to which he belonged, and only knew that it had been attached to certain missions. I obtained from him a vocabulary, which I found on examination, to be the Diegeno language, with some words different from that obtained at San Diego.

April 3d. Up at daylight, to reach the Mission of San Gabriel by breakfast-time; but the horses were not ready, as promised. After waiting three hours, we concluded to breakfast here. The horses at last were brought, the only excuse for the delay being that they could not be caught before. It now began to rain; but hoping that it would not continue, we set off, Mr. Rand accompanying me. But after we had got about three miles, the prospect for fair weather grew less encouraging; and as we were already pretty wet, we thought it best to give up the jaunt and return, much to my regret. Being thus disappointed in seeing the Mission, I was kindly furnished by the editors of the "Los Angeles Star" with the following brief account of it, which had appeared in their paper a few days before:

"Situated in the midst of a fertile valley, surrounded with abundant timber, and supplied by a thousand springs, with an inexhaustible flow of water, the Mission of San Gabriel flourished and became exceedingly rich. Authentic records are said to exist which show that at one time the mission branded fifty thousand calves, manufactured three thousand barrels of wine, and harvested one hundred thousand fanegas (two hundred and sixty-two thousand bushels) of grain a year. The timber for a brigantine was cut, sawed, and fitted at the mission, and then transported to and launched at San Pedro. Five thousand Indians were at one time collected and attached to the mission. They are represented to have been sober and industrious, well clothed and fed; and seem to have experienced as high a state of happiness as they are adapted by nature to receive.

“These five thousand Indians constituted a large family, of which the Padres were the social, religious, and we might almost say political, heads.

“Living thus, this vile and degraded race began to learn some of the fundamental principles of civilized life. The institution of marriage began to be respected, and, blessed by the rites of religion, grew to be so much considered that deviations from its duties were somewhat unfrequent occurrences. The girls, on their arrival at the age of puberty, were separated from the rest of the population, and taught the useful arts of sewing, weaving, carding, etc., and were only permitted to mingle with the population when they had assumed the characters of wives.

“When at present we look around and behold the state of the Indians of this country—when we see their women degraded into a scale of life too menial to be even domestics—when we behold their men brutalized by drink, incapable of work, and following a system of petty thievery for a living, humanity cannot refrain from wishing that the dilapidated Mission of San Gabriel should be renovated, its broken walls be rebuilt, its roofless houses be covered, and its deserted halls be again filled with its ancient industrious, happy, and contented original population.”

I noticed here quantities of craw-fish, weighing from two to ten pounds, which are taken in this bay. We ate of them, and bought a quantity to take to our friends in San Diego. Their flavor resembles that of the lobster, but is so much inferior that they would hardly be tolerated on the tables of the Atlantic coast.

We went on board our vessel before dark, and im-

mediately got under way, with a strong wind from the north-west. Our little craft scudded before it with great speed, the log showing thirteen and a half miles an hour. This continued during the night, carrying us rapidly towards our place of destination.

April 24th. Passed Point Loma at eight o'clock, and before nine anchored at San Diego. The first news I heard was the removal of Mr. Gray as surveyor, and the appointment of Major Emory in his place. This compelled me to discharge all Mr. Gray's party, and commit the completion of the survey of the Gila to Lieutenant Whipple,—an arrangement which reduced the party about to retrace its steps to the Rio Grande about two fifths.

We now set vigorously to work to prepare for our return. Our animals, which were so completely used up in the journey out, had now recovered their strength, with the exception of five or six, which were past recovery. I had been unable to purchase any mules at Los Angeles or elsewhere to the north, and was compelled to depend wholly upon San Diego and its vicinity to make up our deficiencies. Our camp equipage had been procured in San Francisco; but the harness and pack-saddles needed mending and putting in order. The wagons also required the labor of the blacksmith and carpenter on them.

A few days after my return, I was waited upon by Mr. Antoine Leroux, of New Mexico, the celebrated guide who had conducted Colonel Cooke and his brigade to California in 1846, '47, and who had a short time before arrived with the exploring party under Captain Sitgreaves, which he had conducted by the

Zuñi River to the Colorado, and thence by Fort Yuma to California. Mr. Leroux now wished to return to New Mexico, and offered me the services of himself and two men, together with several pack and riding mules, for a moderate compensation. As my party was now quite reduced, and as it was necessary to hire more men, I gladly accepted the proposals of Mr. L., and placed the animals and arrieros directly under his charge, with orders to prepare the train as soon as possible for the march.

While these preparations were being made, Lieutenant Whipple and his assistants were busily occupied in reducing his astronomical observations, and in plotting the maps of the survey of the Gila as far as it had been carried. Duplicates were also made of all the notes connected with the survey, which were transmitted by an officer to Washington for safe keeping. For Lieutenant Whipple's Report of the survey of the Gila, see Appendix D.

Before Captain Ottinger left, he invited me, with others of the Commission, to accompany him on in excursion to the Coronado Islands, a small group lying twenty miles from San Diego. Some ten or twelve gentlemen availed themselves of the Captain's politeness; and, on the morning of the 5th of May, the "Frolic" stood out to sea with a north-west wind, which brought us to the islands in three hours. We came to anchor about a quarter of a mile east of the larger and more southerly island of the group.

One party immediately went with Captain Ottinger to examine the anchorage about the islands, while the other landed. This island rises so abruptly from

the sea, that it was with some difficulty that we could find a landing place. Seeing a little nook, which the dashing waters had worn away from the rocky mass, we made for this, and succeeded in getting on shore. From this place it required much labor to clamber up the rocks for some fifty feet; after which the ascent became easy, and we met with no difficulty in reaching the crest of the island, half a mile distant. The island is a solid wedge-shaped rock, about five hundred feet high, save at the point where we landed, where it is slightly shelving. It runs north-east and south-west, and is about a mile in length, by half that in breadth at its widest part. Towards the northern end its breadth is less than a quarter of a mile. There is some soil on its surface; yet it is entirely destitute of trees. A few small shrubs are seen; and wherever there is soil, it is covered with grass and a great abundance of wild flowers, which in certain spots are so numerous, that they appear like patches of orange, purple, and yellow, when seen from the water. I walked across and along the whole length of the island, but could descend in no place except where we landed. Cacti and other plants grew among the rocks, of which Mr. Thurber obtained specimens.

About a mile to the north-west is another island of nearly the same dimensions as that we were upon, and between them two smaller ones, or rather two masses of rocks, some fifty feet high, without any vegetation. It was among these that Captain Ottinger wished to examine the depth of water; and he was gratified to find excellent anchorage there. Vessels may, therefore, anchor on both sides of these islands, and be well pro-

tected against south-east and south-west gales. The protection from the north-west winds would not be so good. One of these small islands was found to be covered with sea-lions, huge animals as large as an ox. The creatures were asleep when the party landed, and suffered themselves to be approached by the seamen, who for mere sport killed several, by knocking them on the head with stones. Some were believed to weigh as much as one thousand two hundred pounds. Some fine fish were taken by the boats; and all were again on board before dark. After starting on our return, the wind died away and left us becalmed, so that we did not reach San Diego until the following morning. The Coronados were discovered and named by Sebastian Viscaino, in the year 1602, when he entered the port of San Diego.*

The harbor of San Diego abounds in excellent fish; but, owing to the deficiency of timber, there is but little game. Rabbits are plentiful, and occasionally a deer is brought in. On the hills near, and for many miles around, grow wild oats in great profusion, furnishing an excellent fodder for horses and cattle. The other productions are wheat, barley, maize, beans, and vegetables of various kinds. The climate is mild and healthy. During the months of March, April, and May, fogs are frequent in the morning; and up to the time when we left, there was scarcely a morning or evening when a little fire was not necessary. The atmosphere is at all times more moist, with much less heat, than at San Francisco and the adjacent country.

* Torquemada, *Monarquia Indiana*, lib. v. Voyage of Viscaino.

While the preparations were being made for our journey, I made a brief visit to the Mission of San Luis Rey, forty miles north of San Diego. This is the latest of all the California missions, and was founded in 1798. It stands in a rich valley, from one to two miles wide, and is about three miles from the ocean, being separated therefrom by a range of hills. Of all the missionary establishments in the State, this possesses the most extensive as well as the most imposing structure. It is built of adobe, although stone and brick are used in some portions of it. It faces the south, and has a front of five hundred and thirty feet, the greater portion of which exhibits a colonnade of some architectural beauty, although but sixteen or eighteen feet high.* On the front is also a church ninety feet in depth, with a tower and dome. North and south, the dimensions are upwards of six hundred feet. This vast space included every thing that appertained to the mission. On the south-eastern corner is a small Campo Santo. Next comes the church with the priests' apartments immediately adjoining, and a small inclosure, or garden, shut in by the church walls on one side and by the main building on the other. This garden was handsomely laid out, and still contains a variety of fruit and ornamental trees. The main building is about three hundred feet square, with a colonnade in front. In the interior, is an open area of the same dimensions, with a beautiful colonnade all around. In the centre of this was a garden; but the only plant of interest that remains, is a

* The general plan of this building and its admeasurements have been mislaid, so that I am unable to give the exact dimensions.

pepper tree. This stands in a circular bed elevated four or five feet above the area, and is protected by a wall.

Mission of San Luis Rey, California.

On the four sides of this extensive area are double rows of apartments, some of which are very large, including reception rooms, dining halls, sleeping apartments, kitchen, &c. In the rear were corrals or inclosures for cattle; so that every thing appertaining to this vast establishment might be brought within its walls. It is all in a good state of preservation except the north-west corner of the area, where the roof has fallen in. Some of the cattle yards and stables are also out of repair. But the church, and nearly all the apartments occupied for dwellings, are still habitable.

This establishment had been abandoned with most of the other Californian missions; but when the United States became the possessors of the country, several claimants sprang up for it, and its valuable lands adjacent, some resting on purchase, pretended or real, and some on other grounds. It is said to have been purchased by some native Californians from the government about the time the country was changing owners, who sold it to the Americans. Its ownership will be settled by the Board of Land Commissioners appointed by the United States government for the purpose. In the mean time General Hitchcock, commanding the Pacific Division of the U. S. Army, has placed a file of soldiers here, to protect the property and keep off plunderers and squatters.

I remained here two nights, accompanied by Dr. Webb and Mr. Pratt, artist of the Commission, and was hospitably entertained by the Sergeant in charge; the officer in command being absent in San Diego. In such a place as this, with such a range of buildings and cultivated grounds, a prince or a nabob might luxuriate to his heart's content. Near by is an extensive orchard and garden, inclosed with high walls, and filled with every variety of fruit-trees; but the acequias, or irrigating canals, had been neglected, the dams and embankments washed away, and the beautiful gardens and shady walks, where the devotees passed the long hours when not attending to their religious duties, were all overflowed. A swamp filled with rushes and rank weeds had taken possession of these walks and groves; and here the screaming heron and other water fowl had their hiding-places.

The Sergeant, at my request, sent for an old Indian of the neighborhood, who called himself a chief. On learning that an officer of the U. S. government wished to see him, he made his appearance with three others of his tribe. The old man presented himself in the dress of a Mexican officer—a blue coat with red facings trimmed with gold lace, and a high military cap and feather. He was quite communicative, and answered my questions readily. In giving me the words of his language, he enunciated them with great distinctness, and would not be satisfied with my pronunciation until all could at once recognise the word. When I had completed my vocabulary, and read off the native words, he evinced great pleasure as he repeated the corresponding word in Spanish, occasionally exclaiming *Bueno*, or *Muy Bueno!* He called his tribe the *Kechi*.

On inquiring as to the state of things when the padres were here, the old man heaved a deep sigh. He said his tribe was large, and his people all happy, when the good fathers were here to protect them. That they cultivated the soil; assisted in rearing large herds of cattle; were taught to be blacksmiths and carpenters, as well as other trades; that they had plenty to eat, and were happy. He remembered when three thousand of his tribe were settled in the valley, dependent upon or connected with this mission. Now he said they were scattered about, he knew not where, without a home or protectors, and were in a miserable starving condition. A few hundred alone remained in some villages up the valley, a few miles from the mission. He spoke with much affection of Father Peyri, its

original founder, who had resided here for thirty-four years. At no time, he said, were there more than sixteen Spanish soldiers here, who occupied a building facing the mission, which is still standing.

Father Antonio Peyri took possession of this Mission of San Luis Rey (i. e. St. Louis the king) in the year 1798. He first built a small thatched cottage, and asked for a few cattle and Indians from the mission. At the end of his thirty-four years residence, he left it stocked with nearly sixty thousand head of domesticated animals of all sorts, and yielding an annual produce of about thirteen thousand bushels of grain. After so many years of successful labor, in which he expended the most valuable part of his life, the worthy Father left his mission with only what he judged sufficient means to enable him to join his convent in the city of Mexico, where he threw himself upon the charity of his order. The toil of managing such an establishment, would be sufficient motive for a man of Father Peyri's age to retire ; but the new order of things, which had introduced new men and new measures, accelerated his resignation. Whatever his motives may have been, his voluntary retirement in poverty, to spend the remainder of his days in pious exercises, must be applauded by the religious ; and his noble disinterestedness by all.

Mr. Alexander Forbes, who met the venerable Peyri, and who has given us this account of his history, thus closes his remarks on this mission, and the affection entertained by the Indians for their pastor : "The best and most unequivocal proof of the good conduct of these Fathers, is to be found in the unbounded affec-

tion and devotion invariably shown towards them by their Indian subjects. They venerate them not merely as friends and fathers, but with a degree of devotedness approaching to adoration. On the occasion of the removals that have taken place of late years, from political causes, the distress of the Indians in parting with their pastors has been extreme. They have entreated to be allowed to follow them in their exile, with téars and lamentations, and with all the demonstrations of true sorrow and unbounded affection. Indeed, if there ever existed an instance of the perfect justice and propriety of the comparison of the priest and his disciples to a shepherd and his flock, it is in the case of which we are treating. These poor people may indeed be classed with the 'silly sheep' rather than with any other animal; and I believe they would, in the words of the poet, even 'lick the hand though it was raised to shed their blood'—if this were the hand of the friar.*

The harbor of San Diego is second only to that of San Francisco on the Californian coast. On the north and north-west, it is formed by Point Loma, a neck of land which stretches far into the ocean terminated by a bold bluff, one of the most prominent and well-marked headlands on the coast. From this the shore takes an easterly direction for about four miles, when it turns and runs from twelve to fifteen miles towards the south. The southern and western shores of the bay, are low and sandy. The south-western shore is no more than a sand beach, connected by a narrow neck with the

* Forbes's California.—*London*, 1836, p. 230.

main land, and for the greater portion of its length is little more than a natural breakwater. The northern part of this neck is more elevated and about a mile

San Diego, California.

across. Point Loma and the northern shore of the bay, is a promontory about two hundred feet high, and nearly two miles wide, tapering off gradually with a succession of hills as it approaches the town. These hills were covered with chapporal; their declivities, both on the side of the ocean and of the harbor, being cut into deep ravines. At the base on the inner side, is good grazing.

The entrance to this harbor is not more than three or four hundred yards wide. There is a deep channel leading into the inner harbor, which requires some skill in

navigating; but when once the entrance is passed, there is an abundance of water. I saw large ships some six miles within this harbor, and was informed that the Pacific mail steamers, and one of our frigates, had also been there. An accurate survey has lately been made by the United States "Coast Survey" and elaborate maps published with the soundings and all the bearings laid down, to enable navigators to enter it.

About half a mile from Point Loma, is the *Playa*, or beach, where the mail steamers, and other vessels, stop for coal and supplies. It is convenient of access with any wind, and affords a safe anchorage. Here is a small village, and the "hide houses" which have become somewhat celebrated from the graphic account of life in California, and the process of curing hides, given by Mr. Dana, in his "Two Years before the Mast." They still stand precisely as he describes them, and are now only used as barns or store-houses. A fine road along the beach leads to the old town of San Diego, standing on a flat at the base of a high hill which extends about two miles to the south: this flat reaches more than a mile into the bay, preventing the nearer approach of vessels or boats. It also extends northwardly to a shallow opening on the north side of the promontory before described, called "False Bay."

At San Diego, a small stream runs into the bay; but during the summer, it becomes dry. At its floods, it brings down great quantities of sand, which are deposited in the channel; whence fears of serious injury to the harbor have been entertained. To obviate this, it has been proposed to change the course of the river to False Bay, into which it formerly run. It would no

doubt be beneficial, and the plan is worthy the attention of the government.

Three miles south of San Diego is another town near the shore of the bay, which was surveyed and plotted by Mr. Gray, U. S. Surveyor to the Boundary Commission, while on duty here. This is called "New San Diego." It consists of a few substantial frame houses, and is the depot for the United States Subsistence and the Quarter-master's Departments. A large and fine wharf was built here at a great expense; but there is no business to bring vessels here, except an occasional one with government stores. There is no water nearer than the San Diego river, three miles distant. Efforts indeed are making to find it with an Artesian well; but with what success, remains to be seen. There is no timber near, and wood has to be brought some eight or ten miles: nor is there any arable land within four miles. Without wood, water, or arable land, this place can never rise to importance. At the head of the bay are some good lands with pastures for grazing. The bottom lands along the stream back of the old town of San Diego, possess great fertility, and with proper attention might be made very productive.

The admirable harbor of San Diego and its position on the coast, will always make it an important stopping place for shipping; but whether the Playa or beach near the entrance, the old town of San Diego, or "Gray Town" as New San Diego is called by the people of the old town, will have the ascendancy, remains to be seen:—each has its advantages and disadvantages.

It appears from the early Spanish writers, that the promontory north-west of the harbor was once well

wooded; a fact not generally known. The earliest published account of this harbor, must possess an interest for all who watch the progress of California. The reader, too, will perceive, as in the case of San Francisco and Monterey, that the early discoverers saw the great advantages of the places; although it was left for the Americans one hundred and fifty years later to avail themselves of them. The United States were in possession of California before the discovery of its gold placers; and although they have been the means of its rapid advancement to the extraordinary rank it has now attained, yet it is certain that, even without the gold, it would sooner or later have become what it now is, from its agricultural resources and great commercial advantages.

Sebastian Viscaïno having been employed as early as the year 1594 in the "pacification and conquest of California," was selected as the head of an expedition fitted out for further explorations and colonization in 1602. After touching at various places in Lower California, it reached the Coronados Islands. "To the north of these islands," says the narrative, "on the main land, is the famous harbor called San Diego, which the squadron entered at seven in the evening, on the 10th of December; and the day following, the general ordered several persons to survey a forest lying on the north-west side of the bay. This expedition was undertaken by Ensign Alarcon, Captain Peguero, Father Antonio de la Ascension, and eight soldiers. In this forest they found tall and straight oaks and other trees, some shrubs resembling rosemary, and a great variety of fragrant and wholesome plants.

CROSSING THE PECOS.—p. 98. vol. ii.

The high grounds commanded a view of the whole harbor, which appeared spacious, convenient, and well sheltered. The forest borders on the harbor, towards the north-west, and is about three leagues in length, and half a league in breadth. And to the north-west of the wood is another harbor. On their return with their report to the general, he ordered a tent to be pitched for religious worship, and that the ships should be cleaned and tallowed, the people in the mean time being employed in wooding and keeping guard. They had their water from a little island of sand, where they dug deep trenches, in which, during the flood, the water was fresh and good, but on the ebb salt. One day a sentinel placed in the wood gave notice that he saw a great number of Indians coming along the shore, naked, and their skins daubed with black and white colors, and armed with bows and arrows. On this the general desired Father Antonio to go and offer them peace. He was attended by Ensign Juan Francisco and six soldiers. On coming up to the Indians, having made signs of peace with a bit of white linen, and throwing the earth up with their hands, the savages immediately delivered their bows and arrows to the soldiers. Father Antonio embraced them; gave them bread and necklaces, with which they were greatly pleased. But on coming to the general's quarters, the Indians, at the sight of such a number of men, drew back to a little eminence, from whence they sent two women. These approaching the general's tent with a timid air, the religious and others made them presents of beads, biscuits, and strings of bugles; and then dismissed them, to give their countrymen an account

of the usage they had met with from the strangers. Their report was doubtless very favorable; for soon after they all came with them to see the Spaniards. Most of them were painted or besmeared with black and white, and their heads loaded with feathers. The general and others received them with great courtesy, distributing among them several things, and a great many fish which had been caught with the net in their presence. The kind of paint they used looked like a mixture of silver and blue color; and on asking them by signs what it was, they gave them a piece of metallic ore, from whence they made it; and signified by signs that a certain people up the country, who had beards and were clothed like the Spaniards, made from this material very fine ribbons, resembling the laces on the soldiers' buff coats; and some like that on a purple velvet doublet, in which the general was then dressed; adding, that these men, by their dress, complexion, and customs, seemed to be of the same country with themselves. The Indians were quite transported with the good treatment shown them, and every third day came for biscuit and fish, bringing with them skins of several kinds of beasts, as sables, wild cats, and the nets with which they catch them.”*

Another interesting account of San Diego is contained in a letter written by Father Junipero Serra to Father Palou, in the year 1769, when the former landed here for the purpose of establishing the mission :†

“My dear Friend and Sir:—Thank God, I arrived

* Torquemada *Monarchia Indiana*, lib. v.

† Palou. *Vida de Fray Junipero Serra*, p. 76.

the day before yesterday, the first of the month, at this port of San Diego, truly a fine one, and with reason famous. Here I found those who had set out before me, by sea as well as by land, excepting such as died on the way. The brethren, Fathers Crespi, Biscayno, Parron, and Gomez are here, and, with myself, all well, thanks be to God. Here are also two vessels; but the San Carlos is without seamen, all having died except one and the cook. The San Antonio, although she sailed a month and a half later, arrived twenty days before the San Carlos, losing on the voyage eight seamen. In consequence of this loss, the San Antonio will return to San Blas, to procure seamen for herself and the San Carlos. The causes of the delay of the San Carlos were, first, the want of water, and, second, the error which all were in respecting the situation of this port. They supposed it to be in thirty-three or thirty-four degrees north latitude; and strict orders were given to Captain Vila and the rest to keep out in the open sea till they should arrive in thirty-four degrees, and then make the shore in search of the port. As, however, the port in reality lies in $32^{\circ} 34'$, according to the observations which have now been made, they went far beyond the port, thus making the voyage much longer than was necessary. The people got daily worse from the cold and the bad water; and they must all have perished, if they had not discovered the port about the time they did; for they were quite unable to launch the boat to procure more water, or to do any thing whatever for their preservation. The Father Fernando did every thing in his power to relieve the sick; and although he

arrived much reduced in flesh, he had not the disorder, and is now well. We have not suffered hunger or privations, neither have the Indians who came with us; all have arrived fat and healthy. The track through which we have passed is generally very good land, with plenty of water; and there, as well as here, the country is neither rocky nor overcome with brushwood. There are, however, many hills, but they are composed of earth. The road has been in many places good, but the greater part bad. About half way, the valleys and banks of rivulets began to be delightful. We found vines of a large size, and in some cases quite loaded with grapes; we also found abundance of roses, which appeared to be the same as those of Castile. In fine, it is a good country, and very different from that of Old California. We have seen Indians in immense numbers; and all those on this coast of the Pacific contrive to make a good subsistence on various seeds, and by fishing; this they carry on by means of rafts, or canoes made of tule (bulrush), with which they go a great way to sea. They are very civil. All the males, old and young, go naked; the women, however, and even the female children, were decently covered from their breasts downwards. We found in our journey, as well as in the places where we stopped, that they treated us with as much confidence and good will as if they had known us all their lives; but when we offered them any of our victuals, they always refused them. All they cared for was cloth; and only for something of this sort would they exchange their fish or whatever else they had.

“ From this port and intended mission of San

Diego, in Northern California, 3d July, 1769. I kiss the hands of your Reverence, and am your affectionate brother and servant,

“FR. JUNIPERO SERRA.”

Six miles from the town of San Diego, following up the valley, is the venerable Mission of the same name, a spot possessing great picturesque beauty, and

Mission of San Diego.

surrounded by fertile and well watered lands. It was the last of the California missions that was abandoned; and but five years ago its ancient library and its

priest still remained. The buildings, which are of adobe, are not extensive, but are in good preservation. They possess more of an Oriental appearance than any similar establishments. There was formerly a large vineyard and orchard, containing figs, peaches, etc., a portion of which is still in existence. The place is celebrated also for a flourishing orchard of olive trees, which still remains, yielding a great abundance of olives, the excellence of which we had an opportunity of testing on our homeward journey. The mission is at present occupied by United States troops, under the command of Colonel J. B. Magruder, and in consequence is kept in good repair.

San Diego, like Monterey, is noted for its excellent society. There remain many of the old Castilian families here, who have preserved their blood from all admixture with the Indians. In this circle, all Americans and foreigners visiting the place have experienced much pleasure; for such is its refined and social character, that one almost imagines himself again enjoying the delights of home. The Californian ladies are said to possess all the finer qualities of the sex, whether of the head or the heart, and to make most excellent wives. Such have been the attractions of these fair señoritas for the young American officers, that many have been induced to relinquish their commissions in the United States army, and become planters or stock raisers in California.

While detained here, I took occasion to visit the monument erected at the Initial Point, on the Pacific, of the boundary between the United States and Mexico, one marine league south of the southernmost point

of the Bay of San Diego." It is an obelisk of white marble, resting on a pedestal, and is about twenty feet in height. It stands near the margin of the table-land, about two hundred yards from the sea shore, and bears the name of the Commissioner, Surveyor, and Astronomer of the two governments, together with the latitude and longitude, viz. :

Latitude north, $32^{\circ} 31' 59'' 58'$;

Longitude, $7^{\text{h}} 48' 21'' 01$ west from Greenwich.

Monument at Initial Point, Pacific.

This monument stands directly opposite the Coronado Islands, and is seen from a great distance on land as well as by vessels at sea. On the table-land around and south of it, grow large numbers of the beautiful agave.

My journeys through California were not sufficiently extensive to enable me to discuss at length its agricultural resources, nor would an essay of such a character properly belong to a "personal narrative." But I saw sufficient in the valleys of San José, Napa, Carmel, near Monterey, Los Angeles, San Luis Rey, and San Diego, to enable me most confidently to assert that a finer agricultural country does not exist on the face of the globe. Cereals of every description, wheat, maize, barley, peas, rye, and oats grow to perfection, some in one portion, others in other portions of the State, every where yielding more than in any part of the Atlantic States or the Mississippi Valley. Fruits of every kind, including the grape, apples, pears, peaches, plums, cherries, etc., arrive at perfection. But in vegetables especially, whether we regard their variety, their enormous yield, or their excellent flavor, California certainly surpasses any thing I have ever seen in the United States. But the valleys I have mentioned are small in comparison with the broad and magnificent basins of the Sacramento and San Joachin Rivers and their numerous tributaries. The head waters of the San Joachin and the Tulare plains, which are yet unexplored and unsettled, are said to be admirably adapted to the cultivation of rice and cotton. The southern part of the State is more barren, having fewer streams and valleys, with little or no timber. But here occur those large grassy plains or prairies, such as that between the coast and Los Angeles, so well adapted to the raising of cattle. East of the mountains which form the continuation of the Sierra Nevada is a broad sandy desert, extending from the

head of the Gulf of California to the unexplored region and great Central Basin, with which we have been made acquainted by Colonel Frémont. This desert is from one to two hundred miles in width, and alike destitute of water and vegetation, excepting a few thorny shrubs and cacti.

Before leaving California, I take this occasion to acknowledge the favors rendered to the Boundary Commission by the officers of the United States army in California. To General Hitchcock, for the facilities afforded me in my journey to the Geysers, and for an escort of twenty-five men to the Pimo villages. To Lieutenant Eddy, Commissary of Subsistence at San Diego, for provisions furnished us during our stay in the country, and for our homeward journey, as well as for various acts of kindness and attention shown to the members of the Commission. Also to Colonel J. Bankhead Magruder, commanding at San Diego. To this gentleman in particular, both personally and in behalf of the government, I feel under the deepest obligation. At a time when we were left without a carpenter or blacksmith, and when none could be procured, this officer permitted me to send to his mechanics my wagons for repairs, and my animals to be shod, without which aid I could not have left San Diego. In other ways he was of great service to me and the Commission, both during our stay in the country, and while preparing for the journey before us.

FIFTH DIVISION.

SAN DIEGO TO EL PASO, ALONG THE GILA.

CHAPTER XXVI.

SAN DIEGO TO ALAMO MUCHO.

Preparations for the journey to El Paso—Leave San Diego—Accident to wagon—Snook's rancho—San Pasqual—Gen. Kearney's battle at this place—Indian village—San Pasqual Mountain—Difficult ascent—Reach camp at Santa Isabel—Deficiency of transportation—Leroux dispatched for another wagon—Indians of Santa Isabel—A Mormon arrives with a wagon—List of return party—Journey resumed—Luxuriant valley—San Felipe—Indians—Their mode of life—Narrow mountain pass—Vallecita—Desert appearance—Carrizo creek—Increased barrenness—Intense heat—Mules run away—Skeletons and carcasses of animals—Immense destruction of sheep—Utter desolation—Wagon upset—Sacket's Well—Dig for water—Meet Lieut. Sweeney in pursuit of deserters from Fort Yuma—Arrival of bearer of dispatches—Alamo Mucho.

ABOUT the middle of May the members of the Commission left their quarters at San Diego, and encamped some six miles distant near the Mission; where there was good grazing, and where the animals had been chiefly kept since our arrival. They were now busily engaged in completing the preparations necessary before setting out on so long and difficult a journey as

that before us. It was quite doubtful whether we should have sufficient means of transportation; and to make sure of this, all the provisions, tents, instruments, personal baggage, etc., were sent out to the camp. Here they were separated and weighed, or an estimate made, so as to enable us to judge whether our two wagons and twenty pack-mules would be sufficient. Uncertain how long we should be in reaching El Paso, we took seventy days' rations; in addition to which were a quantity of medical stores and anti-scorbutics, including fruits, vegetables, pickles, etc., as these important articles were not to be procured on the way.

I was ill at this time with fever and ague, and thought it most prudent to remain in quarters until the parties had got ready to move, and in fact had passed to a considerable distance into the interior, beyond the reach of the fogs and humid atmosphere of the coast. On the 26th, they commenced their march, intending to stop at Santa Isabel, fifty-six miles distant, where I was to join them.

Several days before this, I sent off twelve head of beef-cattle belonging to the Commission, with an escort of six soldiers, with orders to remain at Fort Yuma until my arrival. This plan was recommended to me, as the cattle could not keep up with us after reaching the great desert; and when they entered upon that much dreaded region, it was thought best that they should not stop, but keep on day and night until water was reached. A number of cattle were sent at the same time to supply the garrison at Fort Yuma.

For my journey, I had provided myself with a small wagon to be drawn by two mules, and a fine American

horse, which had been ridden across the country by Mr. Gray. All the other members of the Commission, as also the laborers, servants, cooks, and arrieros, were provided with mules, which experience had shown to be best for long journeys. They endure fatigue better than horses, will thrive where horses will starve, and in case of accident or emergency, may be used to carry burdens or be harnessed to a team. It was with considerable difficulty that I could procure good mules here; and for those that I obtained, I paid from seventy-five to one hundred dollars each. Nearly every thing we had, including the tents, was new, our former equipments having been to a great extent abandoned on the journey out, as the animals failed, or as they had become past restoring, from eighteen months' use, and constant exposure to a dry heat, rain, or snow.

On the 26th of May, I left San Diego, in company with Dr. Webb, in my small wagon, drawn by two mules. These excellent animals, I must observe, were the same that I started with from the coast of Texas in September, 1850. They had served me in my rapid journey to El Paso, and three times back and forth from that place to the Copper Mines. They had drawn my carriage in my first journey to Sonora, and subsequently, with four others, brought a loaded wagon from the Copper Mines to San Diego. Notwithstanding these journeys and their constant use since we had been in California, they were in as fine condition as when they left the shores of the Atlantic.

My wagon was pretty heavily laden; and ere we had got a mile beyond San Diego, in turning aside for a train, it ran into a gully with such force as to spring

the wooden axle-tree and bend the iron one. The injury did not appear to be serious; and as the road, though hilly, was very good, we hastened on. But this little accident, trifling as it seemed at first, proved a constant source of annoyance to us throughout the journey,

Ten miles from San Diego, is Soledad hill, which is very steep and difficult to pass. One of our loaded wagons had upset here a few days before. The whole country hereabouts is hilly, and destitute of trees, except in the small valleys, where the accumulation of water after rains has sustained a few mezquit trees. The hills on both sides, and as far as the eye can reach, are covered with a thick growth of wild oats. Several families have lately settled here, who make a profitable business of cutting these oats and carrying them to market at San Diego, where they are in good demand. In the afternoon, we reached San Pasqual River, a small and limpid stream, running through a rich valley covered with fine grass, and in which hundreds of cattle were grazing. About a mile in advance, we saw a large rancho, to which we directed our course, having been invited to pass the night there. This was the hacienda of Mrs. Snooks, a California lady, the widow of an Englishman, who now resides at San Diego. Word having been sent to the family occupying the rancho that I would stop here, we met with a hospitable reception, and were provided with an excellent supper and beds. This was formerly one of the largest stock-raising establishments in the country; but the high price of cattle at San Francisco has induced the owner to drive them thither for sale. There were, however, still,

many hundreds remaining. The distance to San Diego is called thirty-six miles.

San Pasqual was the scene of an action between the United States troops and those of Mexico during the late war. Our army was at one time in a perilous situation, from which it was relieved by assistance sent by Commodore Stockton, then at San Diego. I add in a note Colonel Kearney's brief report of this affair.*

May 29th. At seven o'clock, we took leave of our hospitable friends; and continuing across the plain and

HEAD QUARTERS, ARMY OF THE WEST,
San Diego, California, Dec. 13, 1846.

* "SIR: In my communication to you of yesterday's date, I brought the report of the movements of my guard up to the evening of the 5th instant, in camp near a rancho of Mrs. Snooks, about forty miles from San Diego."

* * * * *

After giving the details of his position, and of his officers, the General thus proceeds:

"As the day (December 6) dawned, we approached the enemy at San Pasqual, who was already in the saddle, when Captain Johnston made a furious charge upon them with his advanced guard, and was in a short time after supported by the dragoons, soon after which the enemy gave way, having kept up from the beginning a continual fire upon us. Upon the retreat of the enemy, Captain Moore led off rapidly in pursuit, accompanied by the dragoons mounted on horses, and was followed, though slowly, by the others on their tired mules. The enemy, well mounted, and among the best horsemen in the world, after retreating about half a mile, and seeing an interval between Captain Moore with his advance and the dragoons coming to his support, rallied their whole force, charged with their lances, and, on account of their greatly superior numbers, but few of us in front remained untouched. For five minutes they held the ground from us, when our men coming up, we again drove them, and they fled from the field not to return to it, which we occupied and encamped upon. A most mel-

along the valley near the river, we reached, in six miles, the Indian village of San Pasqual, consisting of forty or fifty rude huts of mud, grass, and poles. A few patches of ground seemed to be cultivated; but,

ancholy duty now remains for me : it is to report the death of my aide-de-camp, Captain Johnston, who was shot dead at the commencement of the action; of Captain Moore, who was lanced just previous to the final retreat of the enemy; and of Lieutenant Hammond, also lanced, and who survived but a few hours. We had also killed, two sergeants, two corporals, and ten privates of the First Dragoons, one private of Volunteers, and one man attached to the Topographical Department. Among the wounded are myself (in two places), Captain Gillespie, and Captain Gibson, of the Volunteers; one sergeant, one bugler, and nine privates of the Dragoons; many of them receiving from two to ten lance wounds, most of them when unhorsed, and incapable of resistance. Our howitzers were not brought into action; but coming to the front at the close of it, before they were turned so as to admit of being fired upon the retreating enemy, the two mules before one of them got alarmed, and, freeing themselves from their drivers, ran off among the enemy, and were thus lost to us. The enemy proved to be a party of about one hundred and sixty Californians, under Andreas Pico, brother of the late Governor. The number of their dead must have been considerable; though I have no means of ascertaining how many, as just previous to their final retreat they carried off all excepting six. The great number of killed and wounded proves that our officers and men have fully sustained the high character and reputation of our troops; and the victory thus gained over more than double our force may assist in forming the wreath of our national glory. I have to return my thanks to many for their gallantry and good conduct on the field, and particularly to Captain Turner, First Dragoons, and to Lieutenant Emory, Topographical Engineers, who were active in performance of their duties in conveying orders from me to the command.

“On the morning of the seventh, having made ambulances for our wounded and interred the dead, we proceeded on our march, when the enemy showed himself, occupying the hills in our front, which they left as we approached, till reaching San Bernardo, a party of them took

on the whole, the place bore a miserable appearance. Few Indians were seen, as they were still indulging in sleep.

Crossing the San Pasqual River again, we reached the base of the hill, or rather mountain, of the same

possession of a hill near to it, and maintained their position till attacked by our advance, who quickly drove them from it, killing and wounding five of their number, with no loss on our part.

“On account of our wounded men, and upon the report of the surgeon that rest was necessary for them, we remained at this place till the morning of the 11th, when Lieutenant Gray, of the navy, in command of a party of sailors and marines, sent out from San Diego by Commodore Stockton, joined us. We proceeded at ten A. M., the enemy no longer showing himself, and on the 12th we reached this place; and I have now to offer my thanks to Commodore Stockton, and all of his gallant command, for the very many kind attentions we have received and continue to receive, from them.

“Very respectfully, your obedient servant,
(Signed) S. W. KEARNEY,
Brigadier General, U. S. A.

“BRIGADIER GENERAL R. JONES,
“Adjutant General, U. S. A.”

“The eminent services of Commodore Stockton,” says Lieutenant Revere, “at this most important and critical juncture, can hardly be too highly extolled. While the party press at home were making free with his proclamations, and denouncing the decided course which he had taken the responsibility to adopt, those who were at the seat of war regarded him as the sheet anchor of their hopes, and were able to see that his whole conduct was suited to the emergency which had arisen. To his gallantry, wisdom, sagacity, and prudence, to his timely and energetic measures, the people of the United States are chiefly indebted for the rapid and final suppression of the Californian insurrection, which at once and for ever sealed the destiny of the most magnificent and opulent territory in the world.”—*Tour in California*, p. 171.

name, the terror of all travellers when accompanied by wagons. We had heard much of this hill, and were fully prepared to undertake the labor of passing it. To keep our seats in the wagon was out of the question; so we all got out, and literally put our shoulders to the wheels. The driver, while he held the reins, braced up the wagon to prevent its upsetting, and Dr. Webb and myself alternately pushed behind or chocked the wheels. The mules tugged with all their strength, and we moved steadily though slowly on, stopping every forty or fifty feet to let the animals rest. The road pursued a zig-zag course, winding along the side and around the hill, which somewhat lessened the difficulty of the ascent. But the steepness was not the greatest difficulty to encounter. This consisted in the "sidling" places, where the wagon could not stand upright, and required to be held up with ropes while ascending or descending. Then, again, portions of the road were very rocky, and much gullied by running water. Occasionally there was a cessation of hills, and a short piece of good road; but then soon came descents, which were attended with more trouble than the ascents; for the wheels had to be locked, and the wagon held up with ropes.

In this way we journeyed the whole day with little variation. San Pasqual forms part of a high mountain ridge running north and south. From its summit we had a fine view of the surrounding country, though lesser hills extended far along its base. I have no doubt that a closer reconnoissance of the country would make known a more practicable route than this, by

avoiding such a frightful mountain. It answers well enough for pack-mules, for which I presume it was constructed; but it was never attempted to be passed with wagons until Colonel Cooke crossed it in 1847. A variety of trees and shrubbery grow along the road, with the greatest abundance and variety of wild flowers, for the most part, as is usual in this country, of brilliant colors.

The long descent from this mountain, after the higher portions had been passed, was comparatively easy. We then reached valleys covered with live-oaks, and affording an abundance of grass. Next, several small hills, with intervening valleys and patches of woodland, were passed, until we reached Santa Isabel. When within a couple of miles of this place my mules began to show the effects of their toilsome day's journey, and the wagon was nearly disabled. Fearing they would not get in, I took my servant's mule and hastened on to our camp, which I reached at seven o'clock; and sent two fresh mules back to the assistance of my party. Soon after Dr. Webb came in, and reported that the axle-tree had given out, and the wagon could proceed no further; so that it was necessary to send pack-mules to bring in its contents, and also provisions for the men. I now took possession of my tent with its appurtenances, and sat down to an excellent supper, prepared in anticipation of my coming. It was pleasing to find myself once more in a tent for the first time since I was taken ill at Ures. It was invariably the case, that we all enjoyed better health when in camp and on our march, than when shut up in quarters with little or nothing to do. An

active, moving life in the open air always brings with it a good appetite and sound sleep, and is the surest antidote to, or rather preventive of, disease. Distance travelled to-day, twenty-two miles.

I found my party encamped a mile beyond the Indian village of Santa Isabel, in one of the most lovely groves of large branching oaks that it had ever been our fortune to meet with. It is closely hemmed in on three sides by high hills, all of which are thickly wooded, while a clear mountain stream passes directly through it. Grass in abundance grew all around us, on which our mules were luxuriating. The tents were all pitched beneath trees, and but a few feet from the stream to which I have alluded.

Soon after I arrived, Colonel Craig, commander of the escort, called and reported his men ready for our march. He had been furnished by Colonel Magruder with six additional soldiers, who were to accompany us to Fort Yuma. Lieutenant Whipple was occupied during the evening in taking astronomical observations, as the weather was now clear and pleasant, a very perceptible change having taken place since we left the coast.

Soon after the train had left its camp near the Mission of San Diego, it was reported to me by Mr. Thurber (who acted as Quarter-Master in addition to his other duties), that another wagon would be absolutely necessary. I accordingly directed that he should send Mr. Leroux at once to the Mormon settlement at San Bernardino, about a hundred miles distant, to purchase a wagon from some of the recently arrived emigrants, and should await his return at Santa Isabel. Mr. Leroux,

who but a short time previous had been to that place, and knew many of the Mormons, set off on his errand.

May 30th. Remained in camp. Got my wagon in, and made a new wooden axle-tree. Found the iron portion much bent and very weak. Lashed the two strongly together with rawhide.

Santa Isabel is an Indian village, and was once a place of some note, when the missionary establishments were in the ascendancy. A roofless church and a few miserable huts, are now all that remain. Nevertheless, the inhabitants cultivate the soil, and by means of irrigation, which they well understand, raise wheat, maize, pumpkins, and beans. The vine succeeds very well here, and was formerly cultivated to a considerable extent. The land near is very fertile, which had induced some Americans to select it for their homes. The long neglected fields were being turned up, which gave the valley a pleasant appearance. Several of the Indians, who belong to the Diegeno tribe, visited our camp to-day. They were dressed in their holiday clothes, such as red and white shirts; while the chief Tomaso, who seemed an intelligent man, wore an old coat trimmed with silver lace, which had once belonged to some Mexican officer.

May 31st. Remained in camp. In the afternoon Mr. Leroux returned, accompanied by a wagon, which was driven by its owner, a Mormon, named Smithson. After paying him, I invited him to remain with us over night, as he had had a fatiguing day's journey. We were much amused during the evening in listening to the history of our Mormon friend, who also enlightened us with a lecture on the peculiar doctrines of his sect.

He seemed a harmless, though zealous man, ardent in his religious belief, and was I should think, a fair specimen of his fraternity. His people had lately purchased the extensive haciendas and buildings at San Bernardino, covering several miles square, for seventy thousand dollars, one half of which amount they had paid in cash. This is one of the richest agricultural districts in the State, and is said to have been a great bargain.

June 1st. In consequence of the heat, I deferred leaving until 6 o'clock in the evening. As the party was now got together, I give the names of those composing it.

JOHN R. BARTLETT,	<i>Commissioner.</i>
THOMAS H. WEBB, M. D.	<i>Secretary and Surgeon.</i>
GEORGE THURBER	<i>Quarter-Master, Commissary, and Botanist.</i>
HENRY C. PRATT,	<i>Draughtsman and Artist.</i>
MALCOLM SEATON,	<i>Assistant Surveyor.</i>
ANTOINE LEROUX,	<i>In charge of Pack-mules ;</i>

with *servants, cooks, arieros, and teamsters.* We had but two wagons, the remainder of our camp-equipage and provisions being transported by pack-mules. Dr. Webb and myself, rode in a small wagon, which I bought in San Francisco, and which turned out to be a very poor affair, made to sell, and not for such a journey as lay before us. We also had riding animals for a change, and in case of accident to the wagon.

The party to complete the survey of the Gila, was as follows :

LIEUT. A. W. WHIPPLE,	<i>Corps Topographical Engineers, Astronomer in command.</i>
-----------------------	--

HUGH CAMPBELL,	<i>1st Assistant.</i>
FRANK WHEATON,	<i>Topographer and Assistant.</i>
HENRY C. FORCE,	<i>Assistant.</i>
JOHN J. PRATT,	<i>Do.</i>
JOHN O'DONOGHUE,	<i>Computer.</i>
CHARLES A. GICQUEL,	<i>Instrument carrier ;</i>

with *flag-bearers, attendants on instruments, laborers, servants, cooks, arrieros, and teamsters*, making altogether about twenty-five men. This party had both wagons and pack-mules as well as myself; and all, both officers and attendants, were mounted on mules or horses.

LIEUT. COLONEL L. S. CRAIG commanded the escort, now reduced by desertion to five men of his own command, with a detail of ten men from that of Colonel Magruder, at San Diego.

The entire party embraced six wagons, twenty-five pack-mules, and about fifty officers and men, mounted.

June 1st. The day being very hot, we did not strike our tents and leave camp until 6 o'clock, P. M., when Colonel Craig and myself led the way. The road was very good along the valley where it was level; but there were many deep gullies, which required the use of ropes to keep the wagons in an erect position. Our course had been north-east. The scene changed as we passed around the spur of the ridge which bounded the eastern part of the valley. Here a broad plain opened to us, with but few trees, although well covered with grass. Our course now lay south-east. The moon rose remarkably bright; and, with a cool and comfortable night, we jogged steadily along and made good progress. Towards midnight we entered a thick grove

of oaks, which so closely lined the road, that it was with some difficulty that we found our way through them. It was a beautiful spot for an encampment, and we felt quite disposed to stop; but we knew of no water near. The grass, too, was quite sparse. We therefore pushed on to the Indian village of San Felipe, near which we encamped at 2 o'clock in the morning. I immediately threw myself down and enjoyed a delightful sleep, such as none can appreciate but those who have tried a camp life. Distance travelled, twenty-eight miles.

June 2d. Found ourselves in a valley without woods, in the lower part of which was a marshy spot with pools of water. Early in the morning our tents were thronged with Indians, who appeared to belong to the Diegeno tribe. They were a filthy looking set, half clad and apparently half starved. During the day, we saw many men and women wading about the marsh gathering roots and seeds; of which two articles and acorns, their principal food consists. The women seemed to be the chief laborers, the men lounging about the camp most of the day. The improvidence of this people seems almost incomprehensible. A very little exertion would have repaid them with all the wheat, maize, and vegetables, required for their subsistence. To these they might add a few cattle, which, in this country, may be obtained for a mere trifle from the ranchos, whose increase in this fine valley would give them a plentiful supply of meat. As it is, they have neither corn nor meat, and spend ten times as much labor in collecting the roots, seeds, and other wretched food they live on, as would be necessary by

cultivating the soil to produce bread, fruits, and meats in abundance.

Their village consists of twenty-three miserable old huts or wigwams built of straw and rushes. Some were covered with raw hides of various colors. A few small patches of ground were cultivated, not exceeding altogether a couple of acres. This was not for the want of land, as there are many hundred acres of good land around them, which by irrigation could be made very fertile. From appearances near the village, I was led to believe that there had long been a settlement here, there being not only traces of former buildings in every direction, but also of acequias or trenches for irrigating the lands.

At 4 P. M. struck our tents. The road continued good for six or seven miles, its course still south-east. The grass had now disappeared, and the thorny chaparral which had taken its place was the first indication that we were passing into a desert region. We now entered a cañon, or mountain pass, caused, like most others, by the action of running water for ages. This pass had been used only for mules, until Colonel Cooke entered the country with wagons. Not being able to get through, he was obliged to come to a halt, and open a passage with axes and hammers through the solid rock, a work of great labor. This defile consists of perpendicular walls of rock about fifteen feet high, and of a width barely sufficient for wagons to pass. In its bed are large masses of rock reaching to the axle-trees. At the narrowest point one of our wagons stuck fast; but after taking out the mules, by dint of lifting and prying, we at length

got through. The space here was but two inches wider than the axle-trees of the wagons. There were, also, several steep and rocky descents where the wheels had to be locked, and the wagons held back with ropes. This pass was not less than three miles in length; and should two trains meet here, it would prove a serious business for both.

The descent into the valley beyond, continued gradual for several miles; but at length our course was stopped by a bold rocky hill running directly across it. This we ascended, over a very bad road; but bad as it was, it was better than the descent, which was the most perfect break-neck place that a wagon ever attempted to pass. It was exceedingly steep, filled with large loose rocks, with an occasional perpendicular leap of three or four feet. I feared that our wagons would not hold together, even if they escaped being upset. But the only accident that happened, was the breaking of our two remaining barometers, a very serious one for the meteorological observations.

At the bottom of this hill, we continued for five or six miles through a valley, with no other vegetation than the usual desert plants and cacti, accompanied by the great *agave* which seemed to luxuriate in this barrenness. At 11 o'clock, P. M., we reached *Vallecita*, eighteen miles from San Felipe, where we pitched our tents among some willows.

June 3d. *Vallecita*, as its name indicates, is a little valley, surrounded by lofty and barren mountains. Pools of sulphurous water are found among the willow bushes, but not a tree was to be seen. The grass, too, had changed, having here a wiry character. A depot of

provisions is kept at this place, with a file of soldiers, for the supply of Fort Yuma, and of government trains passing and repassing. A few horses are also kept here, to facilitate the communication between Fort Yuma and San Diego. The distance between those places is about two hundred and twenty-five miles, and Vallecita is about half way. Beyond it, towards the Colorado, there is little or no grass; so that trains, after they have crossed the desert, usually stop a day or two here, to recruit their animals.

A band of Diegeno Indians live here, to whom the arrival of a train is an event of some importance. They made their appearance early this morning, dressed in their holiday clothes, and appeared more cleanly than any Indians we had seen. Nearly all wore clean white or fancy calico shirts, their only garment; pantaloons being regarded by all Indians as useless articles of dress. These people were formerly connected with the Missions, and hence call themselves Christians; but they now live in a most degraded state of indolence and poverty. They cultivate beans and pumpkins, and pick up an occasional mule, which serves them for food; though their main reliance is upon the acorns, which they collect and store up in large baskets for winter use. The labor of preparing them for food is, like almost all other labor, performed by the women, who were to be seen in front of every hut wielding their heavy stone pestles. When the acorns are reduced to flour, it is washed to remove the bitter taste, and then cooked into a kind of gruel, or made into bread. These Indians were very attentive to us, bringing us wood (which is very scarce here) and water,

and otherwise assisting about the camp. They seemed amply repaid with a few old clothes, or any fragments of food that remained from our tables. Our culinary department was always the great point of attraction to these poor creatures, who would often form a double circle around the camp-fires, much to the annoyance of the cook. The weather was excessively hot to-day, the mercury standing at 105° Fahrenheit in the shade under the bushes.

Took our departure, at 6 P. M. Each mile we advanced, grew more barren. The road continued through deep sand or loose gravel, reminding us that we had fairly entered upon the desert of which we had heard so much. On leaving this valley, all traces of grass disappear. A few stunted shrubs armed with thorns, strove hard for an existence; and the wonder is, that any vegetable life can flourish amid such barrenness. But the cacti and agave seem to delight in such arid and desert regions, as though the intense heat and dry atmosphere were the vivifying influences that nourish them. The bleached bones and dried carcasses of oxen, mules, and sheep, began to mark our road, mementos of the sufferings of former parties. The moon still shone bright, while we journeyed slowly on through the heavy sand for twenty miles, till, at one o'clock in the morning, we arrived at Carrizo Creek. I had got considerably in advance of the wagons, and without waiting for them or my tent, stretched myself on the bare earth (for it was so warm that a covering was unnecessary), and was soon lost in sleep.

June 4th. Carrizo Creek* is one of those remark-

* Carrizo, means *reed grass* (*Arundo phragmites*).

able streams which sometimes spring up in desert regions. It rises in the very centre of barrenness, flows for about a mile, and is again absorbed by the desert. It has worn for itself a bed about fifteen feet below the plain. It is from three to nine inches in depth, and varies from six feet to as many yards in width. Where the banks have been washed away, it receives, in several places, accessions from springs; but when these cease, the stream grows less and less, until it is all absorbed by the sands. In the ravine or bed formed by this water, mezquit bushes grow to the height of ten or twelve feet, the deep green of their foliage presenting a pleasing contrast with the desolation around, and marking the course of the stream from its beginning to its end. The grass, which grows in a few patches, in little nooks which receive their moisture from the creek, is very coarse and wiry; and of this there is not enough to supply the few passing trains that come this way. The heat here to-day was insupportable, the mercury ranging at 114° in the shade. The rays of the sun beat through our tents, so that we could not remain in them. Some retreated beneath the wagons; while myself and others found our way into little gullies or ravines beneath the clay banks, where, partly sheltered by the banks and partly by bushes, we passed the day.

We had much trouble here with our mules, who did not like the coarse grass before them; so that while the herders thought that they were quietly trying to pick up a living on the margin of the stream, they were off at full speed for Vallecita, where they had a recollection of better fare. Some were arrested in their

flight within a few miles of camp, while others were not overtaken until they had reached the grassy patches they were in search of. This is a common habit with mules, and often impedes the progress of a train. I have known them, where the grass was poor, to retrace their steps twenty-five miles for the sake of finding better. Experience showed us that in such places as this the animals must be closely watched, and at night tied up to the wagons.

We noticed a peculiarity in the water here, which was that, although sweet, it did not quench the thirst. We all drank incessantly without being satisfied.

As we entered the great desert here, and expected to find no water, except by digging, until we reached the Colorado, one hundred miles distant, we filled all our kegs, canteens, empty bottles, and every thing else that would hold water. I then directed the wagons to be loaded, the mules packed, and the train to move at sunset.

I have forgotten to mention that we saw along the banks of Carrizo Creek, near our camp, an innumerable quantity of the bones and dried carcasses of sheep, a rare occurrence in a region infested by hungry wolves; but numerous and hungry as the wolves are, there is such a thing as satiating their appetites, and of this we had an example before our eyes. Here were the bodies of many thousands of sheep lying in piles within the space of a hundred yards. This wholesale mortality is said to have been caused by their eating of a poisonous plant; but as we could find no specimens of such a plant, we believed that the poor creatures, after traversing the desert and being probably three or four

days without water, had drunk themselves to death. Most of the bodies were in the immediate vicinity of the stream.

It was not until half-past seven o'clock, P. M., that we moved from camp. The road continued heavy through loose sand and stones, making it impossible to move more than two miles an hour. Six or seven miles brought us to a steep sand hill, which no team alone could ascend. Ten mules were accordingly hitched to each wagon, when by dint of tugging, and a good deal of beating and hard swearing, the poor animals reached the summit with their loads. One of Colonel Craig's wagons was upset and rolled over and over to the bottom of the hill, but fortunately escaped with no other damage than that of smashing the medicine chest; which, however, was a loss we afterwards severely felt.

This was the most desolate spot we had seen, presenting indeed the very climax of barrenness. We were surrounded in all directions by hills of clay, their sides cut into deep ravines. As far as the eye could reach by the light of the moon, which rose at ten o'clock, not a sign of vegetation appeared. I believe there had not been a day, from the time of our landing on the coast of Texas till we trod the shores of the broad Pacific, that we had not seen the mezquit in some form, or the common prickly pear. Here they could not exist.

June 5th. Reached the water-holes called Sackett's Wells, twenty-four miles from Carrizo, at 3 o'clock this morning. Before leaving camp last night, I sent four men with spades in advance, in order that they might

sink some holes, and have a small supply of water for us on our arrival; but as they were ignorant of the place and were unfamiliar with the best indications of water, they had accomplished little. Some more experienced hands now set themselves busily at work in an arroyo, or place where there was a slight depression in the desert, marked by some mezquit bushes, whose freshness showed that water sometimes reached their roots. After digging about six feet, the water began slowly to enter; and by dipping it up with a basin, we managed to supply our animals.

The desert where we were now encamped, is an open and remarkably level plain, with scarcely an undulation. On the south-west, twenty miles distant, is a range of lofty mountains, which forms its limit in that direction. On the north and east, it is bounded by the horizon, no mountains or hills being visible. The soil is either a fine gravel, or loose sand. The vegetation is exceedingly sparse, consisting chiefly of stunted mezquit and the *larrea Mexicana*. Near the arroyo, where water sometimes finds its way, a few mezquit bushes have attained the height of ten feet, whose brilliant hue is most agreeable to the eye, amid so much barrenness. A little grass was found in clumps about a mile from our camp in an arroyo, whither our animals were sent. This, with the young shoots of the mezquit, was all they had. At sunrise this morning, the mercury stood at 92° , and at noon 108° in the shade. Distance from Carrizo Greek, twenty-five miles.

Lieutenant Sweeny arrived this morning from Fort Yuma in pursuit of two deserters from that post, and

remained with us during the day, believing himself to be in advance of them, and that they would stop here for water. In the afternoon Mr. Jenkins reached us from San Diego. He was the bearer of dispatches to me from the government, having left El Paso del Norte on the 19th February. He came by way of Chihuahua and Mazatlan; and had encountered serious obstacles on his route. As there was no party coming across the country by the Gila route, he was obliged to pass through Mexico, which had taken him nearly four months.

As it was too hot to march at all during the day, we continued as before, to make our journeys at night. At 7 P. M. left camp, taking the lead as before in my little wagon, with Colonel Craig riding on a mule at my side, while the wagons and train followed closely behind. The road for the first few miles was heavy; after which, we struck the hard gravel, where it was so smooth that we increased our pace. After keeping with me for an hour and a half, the Colonel left me, saying he would ride back and see to the wagons, as some of them were dropping behind. This course was usual with him. He felt a heavy responsibility upon his shoulders, and deemed it his duty to watch every part of the train. He considered his post to be in the advance; but during every march, whether at night or by day, he rode around the train, to see that all was right, and that his men observed proper vigilance. At 11 o'clock the moon rose, when we could see our way better. The pack-mules, which had been in the rear, soon after came up, and, as was usual with them, pushed by me. On long marches, pack-mules always increase

their speed as they progress, when it becomes difficult to restrain them to the gait of those in wagons. The road continued very good during the night; so that, with the bright light of the moon and the air moderately cool, we made good progress. As morning approached, the road became heavier; when my mules fell back, the pack-mules still keeping on at their former pace. We had now to get out and walk; and this relief to the poor animals enabled us at length to reach the stopping place known as the *Alamo Mucho*, where water is obtained by digging.

Although there may have been cotton-wood trees here in former times, all have now disappeared; for we saw nothing but stumps and a few miserable mezquit trees.

CHAPTER XXVII.

ALAMO MUCHO TO FORT YUMA.

The Desert—Dry basin—"New River"—Alarming news from the train—Colonel Craig's encounter with the deserters from Fort Yuma—Report of Sergeant Quin—Dr. Webb returns in search of Colonel Craig and Sergeant Bale—Loss of wagons on the Desert—Great heat—Return of party with the body of Colonel Craig—Sergeant Bale's return—Further particulars of the encounter with the deserters—Burial of Colonel Craig—Word sent to San Diego—Prompt action of Colonel Magruder—Arrest of the murderers by Indians, and their execution—Colonel Craig's character and services—March resumed—Cooke's Well—Colorado River—Banks washed away—A passage cut through the woods—Arrival at Fort Yuma—Depredations by the Yuma Indians on the camp at night—Unsuccessful pursuit—Lieut. Whipple commences crossing the Colorado.

June 6th. Reached Alamo Mucho on the desert, at 7 o'clock this morning, after a journey of twelve hours without a moment's rest, in which time we had made forty-five miles. In long marches like this with pack-mules, it is not considered advisable to stop; for no rest can be given to the animals without relieving them of their packs, to do which and replace them would require at least two hours. If a pack-train stops without relieving the mules of their burdens, the animals lie down and attempt to roll, an operation which disarranges the packs and often does

much injury. When there is grass and water, it is well, on long marches by daylight, to rest an hour or two during the heat of the day. Feed and water at such times, with rest from their loads, affords much relief; but when there is nothing to offer the weary animals, it is decidedly the best course to hasten on and complete the journey, unless it is too long to be accomplished in a day.

The desert here is a vast open plain, extending as

Well at Alamo Mucho.

far as the eye can reach on every side, except on the south-west, where a chain of mountains appears some

thirty or forty miles distant. The undulations are few and slight. Near our camp was a steep bank about sixty feet high, extending for miles, and descending to a great depression or basin, which appears to have been the bed of a lake. It was in this bed that the wells or pits were sunk from which we obtained water.

About twenty-five miles back from this place we crossed a ravine or arroyo some twenty or thirty feet wide, and about ten feet below the surface of the desert, that forms the bed of what is known as the "New River." Three or four years ago, this ravine was filled with water, as well as a large basin connected with it. The water suddenly appeared here, and by passing emigrants was hailed as a miracle and direct interposition of Divine Providence, like the manna furnished to the Israelites of old.

This phenomenon is now well known to proceed from the Colorado River, which some years rises to a great height, overflowing its banks and the adjacent valley, and sometimes running back through lagoons and depressions in the desert for many miles. It was one of these great risings of the river that caused the sudden appearance of the mysterious "New River" of the desert, which remained two years, and then dried up. By similar inundations the great basin at Alamo Mucho has doubtless been, and may again be, filled. I was told by persons in California who had crossed this desert, that they had found pools of brackish water several miles from the road. These I presume to be deeper basins, where the water stands longer than in the "New River" or the dry basins passed by us.

On the table-land or plain of the desert the vegetation is scanty, consisting of dwarfish mezquit and larrea. In the basin near us were patches of grass, which, with the young twigs of the mezquit bushes, formed the food of our animals. In certain portions of the desert it is extremely annoying to travellers when the wind blows, as clouds of sand then fill the atmosphere. When one of our parties crossed it in January, they were overtaken by one of these storms, from which they suffered greatly, particularly as their animals had perished, and they were forced to traverse it on foot.

Within two hours after my arrival, others of the party who were mounted came in, and among them Mr. Malcolm Seaton, who reported to me that about break of day the train had fallen in with the two deserters of whom Lieutenant Sweeney was in pursuit; that Colonel Craig, having at once recognised them by their dress and muskets, spoke to them, and asked them where they were going. They replied, to Vallecito. The Colonel told them he knew they were deserters from Fort Yuma, and advised them to return with him. After parleying a while, they told him they would not return; that they were desperate, and would shoot any one who attempted to arrest them. Colonel Craig called for Sergeant Quin, of his command, and Sergeant Bale, the non-commissioned officer sent with the men furnished by Colonel Magruder. Mr. Seaton then left, under the impression that Colonel Craig would succeed in persuading the deserters to return with him. Besides the soldiers with the train, there were twenty or more men on whom the

Colonel could have called, had he deemed their aid necessary. As the wagons began to lag, Mr. Seaton hastened on to camp.

About an hour after, Sergeant Quin rode into camp, his hat gone, and in a great state of excitement. He stated, that soon after he and Sergeant Bale had left the train, according to Colonel Craig's orders, they came up with the two deserters; whereupon the latter halted, and declared they would go no further, but must settle the business on the spot. Colonel Craig again expostulated with them, and used every argument to induce them to surrender themselves, and return with him to Fort Yuma, but in vain. The Colonel told them who he was, and said that, if a return to the Fort was so repugnant to them, he would endeavor to have them assigned to his command, in which event they might accompany the Commission. He then dismounted from his mule and handed his revolver to Sergeant Bale, at the same time throwing off his sabre. Thus disarmed, he approached the deserters, showing that he intended no violent measures, and believing that when he pictured to them the difficulties before them in crossing the desert, they would yet consent to abandon their desperate undertaking.

At this moment, the Colonel's mule, being without his rider, moved off, and had got some fifteen or twenty yards, when the Colonel directed Sergeant Quin to stop him. He did so, and had thereby separated himself from the Colonel and Sergeant Bale, when he heard the report of muskets, and looking

round, saw Colonel Craig stagger and fall. The next moment he saw Sergeant Bale rapidly discharging his revolver at the deserters, his mule at the same time prancing about; when presently both of them fell. He immediately advanced in the direction of the Colonel; but before he had got many steps, the deserters rushed towards him, discharging a revolver which they had taken from Bale. Believing that both the Colonel and Sergeant Bale were killed or overpowered, and seeing but little chance for himself against too armed and desperate men, he put spurs to his horse, and made his way as fast as possible to my camp.

As soon as the wagons came up, I ordered an ambulance to be prepared to return with a party in search of Colonel Craig and the missing sergeant, who, I hoped, might yet be found alive. As the mules had now come nearly fifty miles without rest, food, or water, they could not be immediately sent back. Six of the best, however, were at once selected, and a good feed of oats given them. Bedding, clothing, water, and provisions were put in the ambulance, and the whole placed under the charge of Dr. Thomas H. Webb. It was two o'clock in the afternoon before the party could be got off, Lieutenant Whipple and several others accompanying.

From the information given by the party with the train, the encounter with the deserters took place full thirty miles from our camp. To retrace their steps this distance, with our weary animals, journeying beneath an overpowering sun, would require the remainder of the day, and a good portion of the night; yet I deemed it my duty to remain here, though we were

in the heart of the desert, unprotected by a tree or bush, and exposed to a more oppressive heat than we had ever before experienced. As there was but little grass to be found, I caused the last of our corn and oats to be distributed to the animals, giving about two quarts to each.

Disasters seldom come alone; and to add to the misfortunes of the day, Jesus Ortiz, one of the teamsters, came in and reported that the tire of one of the wheels having come off, his wagon had broken down, and in this disabled condition he had left it twelve miles back. As his mules were perishing for water, he had hastened on with them.

After the animals had been watered and had grazed for an hour on the straggling tufts of grass and mezquit bushes, I dispatched a party back with an empty wagon, to bring forward the contents of the broken one. They returned during the evening, and reported that the fore wheel was completely demolished and past repairing, and that the wagon could not be used without another wheel. They also reported that they had seen seven Indians, who kept at a distance, but followed them for several miles.

In the afternoon, Mr. Johnson and an express rider arrived from Fort Yuma, and remained several hours to rest and water their animals. They were bound for San Diego. On hearing of the disaster to our wagon, they informed me, that about seven miles in advance we should find a wagon in good order, which had lately been abandoned, and with which we could replace our disabled one. This was very welcome news to me; for we were not in a condition to lose a

wagon at this stage of our journey. I therefore sent out a party with mules in search, which soon after returned, bringing with them a very good vehicle. Disasters of this kind are of common occurrence on the desert, where mules give out or perish. One of our own wagons, in excellent order, was thus abandoned by the party which crossed here in January, and was soon after made a prize of. Two years previous to our crossing the desert, when a large number of emigrants went over it to California, I was told that more than a hundred good wagons, with harness, pack-saddles, and a vast quantity of camp equipage, were scattered along the road. Many of these were subsequently taken away by parties from the settlements, who came out for them with fresh animals; while others were broken up and used for fuel, or parts taken to restore the injured ones.

Such was the eventful day of the 6th of June, with the heat at 108° Fahrenheit. We pitched our tents, and rolled up the sides to catch a little air; but it was like the African sirocco, and seemed as though issuing from a heated furnace. I found a little bower, about three feet high, made of bushes, and covered with raw hides, into which I crept, and passed the day. This retreat had been constructed by Captain Davidson, who the week before our arrival had been here from Fort Yuma for the purpose of opening a well.

June 7th. In camp at Alamo Mucho. Remained as quiet as possible, moving only from my tent to my little bower. The men were occupied in enlarging the well, as it required much time to dip up the water, which was done with a bucket. The supply

was barely sufficient for the demand, which, in consequence of the great heat, was constant both for man and animals. The thermometer stood at 106°.

At two o'clock in the afternoon, Dr. Webb and his party returned, bringing with them the dead body of Colonel Craig. They did not reach the scene of action until nearly ten o'clock at night, owing to the heaviness of the road, and the wearied condition of their animals. They then had much difficulty in finding the body, it being more than a mile from the spot to which they had been directed by the sergeant. After dividing, and searching in various directions, they formed a line from the road, placing men at such distances from each other that the intervening spaces could be carefully observed. In this manner they at length met with tracks, which finally led them to a spot where the Colonel's loose riding coat was found. Soon after they came to his hat, and finally to his corpse, which was discovered extended on the ground, and carefully covered with a blanket. "The scene," says the Doctor, in his report to me, "was a sad and sickening one, and produced a strong sensation upon all present, and particularly on the Colonel's body servant. It was evident from appearances that the Colonel did not long survive the wound inflicted, or experience much, if any, severe suffering.

"The ground around was as undisturbed as though he had laid himself down to rest, and composedly gone to sleep. Had he lingered long in the exposed situation where he was, there being neither tree nor shrub to afford shelter, his sufferings, as the sun got high in the heavens, would have been extreme,

independent of what he might have undergone from the wound.

“Not many feet distant,” continues Dr. Webb, “we saw the dead body of Sergeant Bale’s horse, which had been perforated by a musket ball. The sergeant was nowhere to be found. I became satisfied that he had left the ground, probably without being mortally wounded. He had evidently, previous to his departure, taken his own blanket from the saddle, and with it covered the remains of the Colonel; for men who would brutally murder a fellow being, it was not for a moment to be presumed would have the slightest regard for the appearance or protection of the mutilated relics. The corpse I caused to be carefully rolled up and placed in the ambulance; and at three o’clock in the morning we mournfully commenced our return march.

“After proceeding about ten miles on our way back, we noticed ahead of us a man reclining by the road side; and on reaching him, much to my satisfaction, he proved to be the missing sergeant.

“When he joined the Colonel, he was told the purpose for which he was summoned; and upon some inquiry being addressed to him, he stated that whilst ready to obey orders, from his knowledge of the desperate character of the deserters, he was confident they would not be taken without bloodshed. However, as already observed, the Colonel’s feelings of kindness outweighed all apprehensions of danger, if he entertained any, and overbalanced all regard for self-protection. Having completely disarmed himself, and lessened his security still further by sending his

sergeant for the stray mule, one of the deserters (Corporal Hays) said to the other, 'Now is our chance, as there is only a man apiece;' whereupon they levelled their muskets, took deliberate aim, and fired. Hays, who shot the Colonel, was within five feet of him.

"The buck-shot from Condon's musket passed through the calf of Sergeant Bale's leg, the ball at the same time pierced the body of the horse which he was riding. He discharged two or three shots from the Colonel's revolver; but the prancing of the animal under the wound received, prevented true aim being taken. The horse almost immediately fell; and before the sergeant could disentangle himself from the trappings, the deserters caught hold of him, and wrenched away the revolver, but promised to inflict no additional injury upon him if he would remain quiet, which, under existing circumstances, he very properly engaged to do. He asked them to allow him to go to the Colonel; to which they did not object. They inquired if the Colonel had not some brandy with him. He replied; probably not, the Colonel not being a drinking man. However, they went to the body ere life had left it, and searched, and probably rifled, the pockets, as some small articles known to belong to the Colonel have not since been found.

"They then turned in pursuit of Sergeant Quin, discharging several shots at him, their object probably being to obtain the two mules. Quin, as already remarked, effected his escape with his own animal; but they secured the Colonel's. Both mounted it, and made directly for the mountains."

For the finale of this melancholy affair I refer the reader to the accompanying note.*

* While the party were engaged in searching for Colonel Craig and the Sergeant, the express rider from Fort Yuma, on his way to San Diego, overtook them ; which gave Dr. Webb an opportunity to send intelligence to that place, Vallecito, Santa Isabel, etc., etc., relative to the probable fate of Colonel Craig, in order that suitable measures might be taken to apprehend the deserters, should they present themselves there.

As soon as the news was received by Colonel Magruder, commanding at San Diego, he sent expresses to the various military posts and settlements, and aroused the Indians in Southern California, whereby he was enabled to establish a cordon across the country with a view of intercepting the murderers. The routes are so few, and the watering places so well known, that this object was easily attained. A reward, too, was offered the Indians, to induce them to thoroughly scour the country and prevent the escape of these men. It was not many days before a party of Indians engaged in this duty discovered two men with muskets ; and believing them to be the murderers, all but two concealed themselves. One of these Indians was a chief, an exceedingly shrewd man, who desired to secure his prize without bloodshed. They, therefore, professed friendship for the men, and proposed to buy their muskets ; an offer which the deserters gladly accepted, money being more important to them now than weapons. They were accordingly paid eight dollars each, and the cunning Indians thus became possessed of their arms. But one of the deserters being still in possession of a large revolver, it was necessary to disarm him of this before they could make sure of their prisoners. The Chief, therefore, manifested a great curiosity as to this singular weapon, and asked the man to let him examine it. Not suspecting the object of the Indian, who he supposed had never seen a revolver before, he unhesitatingly handed it to him for inspection. The Chief no sooner had it in his possession, than he stepped back and presented it to the breast of the deserter. The two Indians now gave the war-whoop ; whereupon the rest of the party, numbering some twelve or fourteen, sprang from their hiding-place, and at once surrounded the prisoners.

They were conducted to the Mission of San Diego, and there surren-

I was desirous to take the body of Colonel Craig to Fort Yuma for burial with military honors; but Dr. Webb pronounced this impracticable, owing to its rapid decomposition, as it would require two, if not three, days to reach that place. A deep grave was, therefore, dug in the desert near our camp, and a few rods from the margin of the great basin. At sunset, when the mules had received their packs, the wagons had been loaded, and the party were ready to move, a procession was formed, and the mortal remains of our excellent and much beloved friend, borne upon a cot by four soldiers, were consigned to his lonely grave. I read on the occasion the burial service of the Church of England. There was neither mound, rock, nor tree to mark the spot; a dreary solitude reigned around us, uninterrupted by a single object, save the animals and men belonging to the party. Even the wind had died away; and in the silence that accompanied our sad and solitary rites, Wolfe's beautiful lines on the burial of Sir John Moore involuntarily suggested themselves to every mind.

In order that the spot might be identified, a wooden cross was erected at the head of the grave, on which was inscribed:

"LIEUT. COL. L. S. CRAIG, U. S. A.
Died June 6, 1852."

dered to Colonel Magruder. After much delay, arising out of the question whether they should be tried by a military court martial or by the civic courts, they were finally tried, condemned, and hanged at San Diego, in presence of a vast multitude, among which were many Indians. The murderers were both Englishmen, and are said to have been deserters from the British army.

Colonel Craig was an officer of whom the army and the nation had just cause to feel proud. He entered the army from the love he felt for a soldier's life, and without the advantages which a military education at West Point is supposed to confer. Yet such was his devotion to his profession, such the skill he acquired in it, and such the bravery shown by him when called to serve his country, that he soon attained the rank of captain, and was breveted Lieutenant Colonel for gallant service rendered at the battles of Cherubusco and Molino Del Rey. His whole soul was absorbed in his profession, and he spared no pains to render his command skilful in the use of their arms. He was always most punctilious in the discharge of duty; and however much his command was reduced by sickness or absence, he kept up his daily drills and parades with as much rigor and discipline as though an entire regiment were under his charge. Towards his men he manifested the interest of a father as well as that of a commander, and was greatly beloved by them in return. During the stay of the Commission at San Diego, when nearly all the officers attached to it took advantage of the necessary detention to visit other parts of California, he remained in camp with his men, nor did he leave them for a single day, even when desertion had reduced their number to five. It was a source of deep mortification to him, that men who had followed him through the severe campaigns of the Mexican war should desert him here, for the sake of pecuniary advantage. His genuine kindness of heart, honesty of purpose, and rigid adherence to duty, had won for him

a large circle of devoted friends among civilians, as well as among his brother officers.*

At 8 o'clock in the evening we left camp, our hearts filled with sadness. Passed several wagons in good condition which had been abandoned by their owners, among them some large ones, which bore the letters U. S., showing, as we were afterwards told was the case, that they had belonged to government trains, the mules of which had perished. The whitened bones of animals marked the road in many places, terrors to passing emigrants. At twelve o'clock the moon arose, before which time we had much difficulty in finding the road; for so little was the desert travelled, that it was only by taking a star for our guide that we managed to keep in the right direction. I rode a mule all this night, and found it no easy matter to retain my seat in the saddle. Such, in fact, was the case with many

* I cannot refrain from relating an anecdote to show that Colonel Craig's kindness was extended to animals as well as his fellow beings. In our various marches across deserts, our animals often suffered much for want of water, and in consequence of the intense heat, required great attention. Notwithstanding the Colonel had men to take care of his horse, so fearful was he that he might not receive proper care, that at the close of a march he always accompanied his horse to the water (when it was to be had), and, after seeing the animal well washed and cleaned, would himself give him the luxury of a good sponging. The result was, his horse was always in fine condition, and without the ailments incident to constant use under the saddle in a hot climate. On one occasion when we made a long march, and encamped without water for the animals, and but a scanty supply for ourselves, a little was spared to the officers to wash themselves in the morning. The Colonel made a request to each of them, to refrain from using soap, that he might have the water they had used for his horse; by which means he collected a gallon for the use of his favorite.

of us ; and some of the party were so much overcome with drowsiness, that fastening their mules to bushes, or to their legs, they lay down on the desert, and stole a few minutes' sleep. The road continued very sandy, and consequently very fatiguing to our jaded animals, which had had but little food for the last four days. As there was no necessity for keeping with the wagons, I hastened on with the pack-mules and several men who were mounted, and reached the next watering place, known as Cooke's Well, at six o'clock in the morning, having been ten hours in the saddle. The distance from our last camp, was twenty-eight miles. After some time, finding that neither the wagons nor my *carretella* (small wagon) came in, I sent back some of the pack-mules to their aid. But even with this assistance, they did not come up until three or four hours after my arrival.

June 8th. At Cooke's Well. On reaching here this morning, we were so much fatigued that we did not pitch our tents, but threw ourselves down on the bare sand beneath some mezquit trees, and were soon lost in sleep. The water obtained here was from a hole dug in the earth some ten or twelve feet deep, in a place about twenty feet lower than the general level of the desert. It had to be dipped up in a bucket, and passed to a second person midway towards the top, who emptied it into a basin on the surface, from which the animals drank. There was no grass here, but a thick growth of mezquit trees about twelve feet high, with very wide spreading branches. These were loaded with beans, on which our half-famished mules fed freely, for it was all we could give them. As these trees afforded a

good shade, we remained beneath them during the day, which was as hot as before, the mercury ranging as high as 106° . But even with this heat, we deemed it a great luxury to be surrounded by such a delightful grove, after the total barrenness and desolation with which we had been surrounded for so many days. We had now left the plateau of the desert, and were upon the bottom-land with an alluvial soil. The party were so much exhausted with the last night's march, and the exciting events which preceded it, that I determined to remain quiet during the day, and not leave until the moon arose.

June 9th. Left camp at half-past one in the morning, when the moon afforded a feeble light, without which it would have been impossible to find our way. The whole party kept close together, with a sharp look out; as we were now in the country of the Yuma Indians, with whom the Americans are at war. We learned too, from the express that passed us on the desert, that bands of these Indians had been seen here two days before. Our journey was through a bottom filled with mezquit and cotton-woods; and from the great quantity of fallen trees of a large growth, one is led to believe that the whole bottom, from the point near Cooke's Well, which is fifteen miles from the river, must have been covered with water within a few years, and for a considerable time too, to cause such a destruction of timber.

For several miles after leaving the desert, and between that and the bottom land, there ran along our left a great sand-drift, or belt of moving sand, which extends far to the northward, and seems to be gradual-

ly encroaching upon the bottom. It is about forty feet high, and in its progress swallows up the largest trees of the valley. It is so loose as to be impassable for animals, and very difficult for men.*

At 6 o'clock, our eyes were greeted with a sight of the great Colorado River, twelve miles below its junction with the Gila, at a place called "The Algodones," and soon after, we halted upon its bank. It was much swollen, and rushed by with great velocity, washing away the banks and carrying with it numberless snags and trees. The water, though sweet, was much charged with mud, giving it a dark reddish appearance, whence its name. We had seen no stream since leaving the Mississippi (the rivers in Upper California excepted) at all comparable, in point of size, to the Colorado.

After watering the animals, I thought it best to proceed a few miles further. Lieutenant Whipple, who had been here before, and was familiar with the country, said we should find a grove of mezquit trees, which would furnish food for the animals; for the valley of the Colorado affords no grass. Near this spot is a rocky spur of the adjacent hills, called "Pilot Knob," extending to the river, where we found the remains of a stone fort built a few years before, by a party of Americans, who established a ferry here. On this ridge was one of the iron monuments erected by the Boundary Commission the year before, which the

* Since my return, I have been informed by Major Andrews, U. S. A., who was stationed at Fort Yuma at the time of my visit, that this belt of sand is about four miles in width, and from twelve to fifteen in length.

Yumas had already overthrown. The road ran along the river's bank, which, as well as the bottom-land, was filled with a dense forest of willows, cotton-woods, and mezquit. But we had not proceeded far before our progress was suddenly arrested at a place where the road was entirely washed away. We now retraced our steps a short distance, but found it impossible to get along with the wagons without first cutting a path. All our axes were therefore brought into requisition; but as much time appeared to be necessary to accomplish this work, and as the pack-mules could push through, Mr. Leroux led the way followed by Dr. Webb and myself. On reaching the spot selected by Mr. L. for the encampment, the mules were unpacked: we endeavored to lead them to the water, but found to our surprise that it could not be approached, in consequence of a high abrupt bank caused by the rushing waters of the Colorado. We accordingly saddled up again and pushed on towards Fort Yuma, which appeared a few miles in advance, the stars and stripes waving from the flag-staff first greeting our eyes through the dense foliage of the valley. When within a mile of the Fort, our further progress was stopped by a sluice which extended across the road, as broad as the river, and caused by its overflow. It seemed to run far into the interior, and to be passable only with boats. Perceiving a rude wigwam on the river's bank, the Doctor and myself took possession of it, and, hitching our mules to trees, lay down to rest ourselves; for it was then noon, and we had been in the saddle since one o'clock in the morning.

An hour after I was aroused from my sleep by a

messenger from Major Heintzelman, commanding at Fort Yuma (whose sentinels, ever on the watch, had discovered our approach some hours before), inviting me to the Fort, and sending a scow with men to take us across the sluice. Dr. Webb and myself availed ourselves of the invitation, the rest of the party with the wagons not having yet come up. We proceeded on foot, and, after crossing the sluice, were met by several officers, who conducted us to the Major's quarters. We received a warm reception from them all; for visitors and countrymen are an exceeding rarity in this out of the way spot. A few emigrants, it is true, pass on their way to California; but they seldom reach here before August. Major Heintzelman invited me to take up my quarters with him, while Dr. Webb remained with Lieutenant Paige. The other officers we met here were Major Andrews, Captain Davidson, Lieutenants Curtis, Hendershott, Sweeney, and Bond, and Dr. Milhau.

The train and the remainder of the Commission encamped on the opposite side of the sluice, my wish being to cross the Colorado as soon as possible, which could be done as easily from that place as from the Fort.

June 10th. The officers of the Commission crossed the sluice this morning and came up to the Fort, where they were all kindly received and hospitably entertained.

I now commenced arrangements for crossing the Colorado, which, in consequence of the great rise in its waters, and their increased rapidity, was a matter of much difficulty and risk. There was nothing to

cross in but a small and indifferent scow, which could carry but one wagon at a time, and but a small number of animals. The entire number to be ferried over were one hundred and thirty-six mules and horses, twelve oxen, and seven wagons with their contents. Anxious that Lieutenant Whipple should not be detained a moment with the survey of the river Gila, which was to commence at its junction with the Colorado, and be carried to the point where the work was suspended in January, I directed his party to be moved over first, and as soon as the scow, which needed some repairs, could be made ready. The thermometer stood to-day in the shade at the Fort, where there was a current of air, at 105° ; yet, as we were now quiet, it did not seem more oppressive than when in New York at 90° .

June 11th. The startling news was brought me this morning, that the Yumas had entered our camp the preceding night, and stolen fifteen of our animals, including my valuable horse, the same that had been ridden by Mr. Gray in his journey across. He was the finest I had seen in the country, and had been brought to New Mexico from Kentucky. But this was trifling to the loss of so many riding and pack-mules, as it was impossible to replace them here. There had been two men on guard during the night; but they knew nothing of our loss until the animals were missing in the morning, when the footprints of the Indians became visible. The animals, which had all been staked, or tied to trees, seemed to have been loosened and led away without the least noise by these accomplished marauders. I gave orders to take the trail and set off in pursuit, not with the expectation of

overtaking the Indians and recovering our property, but with the hope that, in the hurry of escape, some of the mules might have got away, which we might recover. But the pursuit was not attended with success. The parties returned after following the trail six or eight miles, which was as far as they could go with safety ; as the enemy might be lying in ambush, and overcome their pursuers when little expected. Experience has shown the utter futility of pursuing well mounted Indians on such an occasion, after they have got three or four hours the start ; for they urge on their animals to the utmost speed. Mr. Leroux, who is an old trapper, guide, and hunter, and whose life for twenty-five years has been spent in New Mexico, has been often engaged in fights with the Indians, as well as in pursuing them to recover stolen animals. He says the only way to overtake them in such cases is, to take provisions for several days, and on first setting out in pursuit, not to hurry the animals, but follow the trail at a steady and moderate pace while daylight lasts. At night stop and rest ; and as soon as daylight appears, continue the pursuit in the same manner, taking care not to overwork the animals. By thus continuing the chase, the third day will in most cases bring you up with the enemy ; whose proximity can be ascertained by any experienced hunter, from the freshness of the trail, the manure of the animals, etc. It then becomes necessary to proceed with caution, and with scouts ahead. When the Indians are discovered, the pursuers keep at a distance concealed, and govern themselves by circumstances, whether to make an open attack, or wait until they have encamped

for the night and then surprise them. When Indians find themselves pursued, they run for several days, and then scatter, so that it is impossible to catch them; but if they suppose they are not followed, they stop at the end of one or two days.

Lieutenant Whipple commenced crossing with his party this morning. It had been the practice to swim animals across the river; but it was now so swollen and rapid, as to preclude the possibility of so doing. They had therefore to be ferried over in the scow, a few at a time. The wagons were unloaded and taken over empty. Even with the aid of all our men, the progress in crossing was slow; and on several occasions the scow, failing to reach the landing place on the opposite bank, was swept away by the current between two and three miles down stream, before a landing could be effected. It had then to be towed up again with much labor, until it reached some nook or low spot in the bank where the animals could be landed. In this manner several hours were sometimes required for a single crossing.

CHAPTER XXVIII.

FORT YUMA AND THE ADJACENT COUNTRY.

Crossing of the Colorado continued—Description of Fort Yuma—The Colorado and Gila Rivers—The adjacent country—Rich alluvial bottoms—Facility of irrigation—Ruins of the old Spanish Missions—Difficulty of supplying Fort Yuma—Plan for surveying the head waters of the Gulf of California—Frustrated by Colonel Graham—Discovery of the Colorado in 1540 by Alarchon—Later voyages—Difficulties in navigating the Colorado—Attempt of a steamer to ascend the river—Its velocity and height—Fort Defiance—Massacre of Dr. Langdon and his party by the Yumas—Indians of the Colorado—Early tribes not identified—The Yumas—Cocopas—Mohavis—Extent of Alarchon's voyage in 1542—Fathers Kino, Font, and Garces.

June 12th. At Fort Yuma. Lieutenant Whipple continued crossing his party over the Colorado, and commenced the survey at the mouth of the Gila.

An express was sent by Major Heintzelman to San Diego with the particulars of Colonel Craig's death, in order that additional efforts might be made to arrest the murderers.

Colonel McCall, Inspector General U. S. Army, arrived to-day, accompanied by Lieutenants Bond and Gardiner, to inspect the troops at Fort Yuma.

June 13th. In accordance with the orders of General Hitchcock, Major Heintzelman detailed Lieutenant

G. W. Paige, with twenty-seven men as an escort, to accompany the Commission to the Pimo Villages. They commenced crossing the Colorado to-day; but, owing to the swiftness of the current, were so unfortunate as to swamp their boat, which was laden with provisions. Excepting this accident, the parties of Lieutenants Whipple and Paige got safely over, and encamped on the margin of the river.

June 14th. Sent the cattle over to-day, a more troublesome task than was expected. As they refused to lie down in the small scow, they were lassoed and thrown, and then drawn into it by their feet with mules. Once, just as the scow reached the opposite bank, one of the cattle broke loose, leaped into the river, and swam back; the current carrying him so far down, that he escaped into the woods, and could not again be found.

June 15th. While the parties were still engaged ingetting across the river, I took occasion to make repairs on the wagons. My small wagon, in addition to the axle-tree, had given out in other places. An examination showed plainly that it was an article "made to sell," and not to use. Every portion was found defective, all flaws being carefully covered up with paint. With no other conveyance than this for our long journey, Dr. Webb and I had a poor prospect ahead. The Doctor's riding mule was among the number stolen. The wagon we had picked up on the desert was found to be loose in many parts, requiring repairs. In consequence of the loss in horses and mules that we had sustained by the Yumas, we were obliged to add some hundred pounds to each

of the wagons, and an additional weight to each pack-mule ; besides which I nearly filled one of the wagons belonging to the escort. We should thus have to resume our journey with every wagon and mule loaded to the utmost, and without a single spare animal to replace any that might be broken down or lost.

In repairing injuries to our wagons, every facility had been furnished me by Major Heintzelman, and by Major Andrews, United States Quarter-master at Fort Yuma. For their aid also in crossing the river, and for many acts of kindness extended by the officers here to myself and the gentlemen associated with me in the Commission, I take this occasion to express my acknowledgments.

My cook ran away last night ; which event, though it gave me the use of one more mule, deprived me of a functionary whose services could not easily be dispensed with.

June 16th. Fort Yuma stands upon a rocky hill at the junction of the Gila and Colorado Rivers, and on the north-west angle of the bank of the united stream. The Colorado comes from the north, and, where it receives the Gila, is about five hundred yards wide. A bend, which the Gila takes about fifteen miles from its mouth, makes it come from the south to join the Colorado. The united stream first takes a westerly course, forcing itself through a cañon in a chain of rocky hills seventy feet high, and about three hundred and fifty yards in length. After sweeping around some seven or eight miles, it again assumes a southerly direction ; and after a very tortuous course for about a hundred and thirty miles, it empties into the Gulf of

JUNCTION OF THE GILA AND COLORADO RIVERS. LOOKING UP THE GILA.

California. The rocky hills extend four or five hundred yards north of the junction, and between two and three miles to the south of it. Beyond the latter termination rises the great plateau, or desert. The Colorado flows through a bottom or valley from two to four miles in width, thickly covered with cotton-wood and mezquit; beyond which is the desert, from sixty to seventy feet above the valley. As far as I could judge, from a bird's-eye view taken from Fort Yuma, I should think the bottom-land of the Gila was from three to four miles wide near the junction. The portion towards the river is thickly covered with cotton-wood, and with willows on the margin, while that further back has nothing but mezquit. A fine panoramic view is presented of the whole country, from the summit of the hills on which the fort stands. Looking northward, the course of the Colorado can be traced for about fifteen miles, when it suddenly winds around the base of a mountain ridge, and diverges to the north-west. In this direction the view is most extensive. Ridge after ridge of mountains is seen, one rising above and beyond the other, for a distance of about eighty miles. The higher chains assume the most varied and fantastic shapes, resembling cupolas, minarets, pyramids, domes, chimneys, etc. One of these singular summits is called the "Chimney Rock;" and from Fort Yuma is the most striking object in the landscape. It is said to be fifteen miles distant in a direct line, and about thirty following the course of the Colorado.

On the east of the Colorado is the delta of the Gila. How far this extends back cannot be seen, the trees

shutting off the view of the desert. On the north and west the line of the desert is perceived at a distance of about three miles, this line of view being interrupted by the isolated mountain called "Pilot Knob." At the south, short isolated ridges of mountains are seen at a great distance. Mr. Pratt took a panoramic view of the country here, which will convey a better idea than any description I can give.

The Gila was not over fifty yards wide at its mouth ; but its width varies much in different seasons, being influenced by the rise of the Colorado, as well as the state of its own waters. The Colorado was now so high as to cause the Gila to flow back full fifteen miles. The Gila was still low, and, except near the junction, but a diminutive stream. It is doubtful whether it can ever be navigated, except at its floods, and these are by no means regular. At such times flat-bottomed boats might pass to the mouth of the Salinas, near the Pimo villages.

The singular bend which the Colorado takes after it receives the Gila, gives to the United States both its banks for the distance of seven miles from the junction, or to the point where it resumes its southerly course. This arises from the stipulations of the fifth article of the treaty with Mexico defining the boundary line, which says, that "a straight line shall be drawn from the middle of the Rio Gila, where it unites with the Colorado, to a point on the coast of the Pacific Ocean, distant one marine league due south of the southernmost point of the port of San Diego." The land on the southern bank of the Colorado which we thereby obtain is of little value for agricultural purposes ; but should a considerable

town be built where Fort Yuma now stands, which is altogether probable if a railway should ever pass here, it will be an advantage to the United States to possess both the banks of this river for so long a distance.

The bottom-lands of the Colorado below the junction bear the traces of former cultivation, *acequias* being seen in many places. Whether this cultivation was by the Spaniards while they had a mission here towards the close of the last century, or whether by the Indians at an earlier period, is not known. But from the large trees, both erect and fallen, which now cover the bottom, even where the ditches appear, the cultivation, in my opinion, was anterior to the occupation by the Spaniards. I have never seen bottom-lands of this character which might be more easily irrigated. The banks of both rivers are here low ; and the descent near Fort Yuma would permit the opening of a canal a few miles above, which would irrigate the whole valley. When a stream is far below the level of the bottom-land, and its fall but slight, it is necessary to make the canal so long that the expense will not warrant the undertaking. The active and enterprising commander here intends bringing these rich lands into cultivation as soon as he has completed the quarters for the men, upon which he is now engaged. Should he do so, he will be able to furnish his command with what they now most stand in need of—a good supply of vegetables.

Close by Fort Yuma the traces of the old Spanish Mission buildings may still be seen. These consist of partly demolished stone walls of small buildings; though a few years since the walls of a church were also

visible. At the time of our visit these had been removed, and used for building the barracks. There were two hundred soldiers, artillery and infantry, here, under the command of Major Heintzelman. The officers and men were living in tents, covered with sheds made of branches to protect them from the sun. The post was established the year previous, but, not receiving the usual supply of provisions, had been abandoned for several months. The command was as comfortably situated as the nature of the place and its inaccessibility would allow; but long deprivation of fresh provisions and vegetables had engendered the scurvy among the soldiers.

The fort had heretofore been supplied by land from San Diego, at an enormous expense; but a partially successful attempt had just been made to supply the place by water. A vessel loaded with stores was sent up the Gulf of California, and succeeded in getting some distance up the river; but owing to the strong current she could not reach the fort. Wagons and scows were therefore sent down to bring up the provisions, a labor attended with nearly as much risk and expense as bringing them all the way by land from the coast. It was in contemplation to procure a small steamer for fetching the supplies from the head of the gulf. Such a vessel could meet with little or no difficulty in getting up, and could also be used to advantage in exploring the Colorado above the fort.

In connection with the survey of the river Gila, it was my earnest desire to explore and survey that portion of the river Colorado which extends from the point where it receives the Gila to the Gulf of Califor-

nia, a distance now understood to be about one hundred and thirty miles, by the sinuosities of the river.

With this view, I recommended to the Hon. Alex. H. H. Stuart, Secretary of the Interior, that Lieutenant I. G. Strain, of the Navy, an officer attached to the Commission, should be directed to take the four iron boats belonging to it, and survey the head waters of the Gulf of California, and the river Colorado to the mouth of the Gila. Lieutenant Strain accordingly proceeded to Washington, and submitted to the Hon. Secretary of the Interior the plan embraced in the following letter:

“WASHINGTON, D. C., October 31, 1850.

“SIR:—In reference to the duty to which J. R. Bartlett, Esq., the United States Boundary Commissioner, requested I should be assigned, I have the honor herewith to submit two projects—one of which, I hope, may merit your approval.

“In assigning me to the command of the flotilla, composed of four boats belonging to the Boundary Commission, it was suggested that—in consideration of the important results which must accrue to the country from the early exploration and survey of the river Colorado below its junction with the Gila, as well as that of the upper waters of the Gulf of California, without which the former would be nearly valueless,—the Navy Department might be induced to detail the requisite number of seamen for the management of the boats; which would thus materially lessen the outlay of the fund appropriated for the prosecution of the Boundary Survey. No men could be obtained better adapted to this duty than seamen.

“The importance of the examination proposed by Mr. Bartlett, is obvious to every one acquainted with the present state of our new territories on the Pacific, while the peculiar nature of the case does not place the duties in any particular department of the government. The examination of the upper part of the Gulf, and that portion of the Colorado between its mouth and junction with the Gila, cannot be considered as pertaining to the ‘Coast Survey,’ as it is entirely embraced in the

territory of the Mexican Republic ; yet the treaty of Guadalupe Hidalgo, giving to our citizens free ingress to the valleys of the Gila and Colorado, through the Gulf, which is the only route available for the purposes of commerce, makes an early examination of equal importance to that of any portion of the *coast* of our newly acquired territories.

“ Could the sympathies of the Navy Department be enlisted in favor of this examination, and crews assigned to the boats already built for the use of the Boundary Commission, the service could be effectually and economically performed.

“ If, however, the government should not deem such measures desirable, I would respectfully suggest another project, which, though it would not possess all the advantages of that already suggested, would prove the most economical mode of prosecuting the explorations and surveys with the funds which are now, or may be placed hereafter, at the disposal of the Interior Department and the Boundary Commissioner.

“ The second project is as follows : That the four boats should be dispatched, in charge of two passed midshipmen and five seamen, in a steamer which will sail about the first of December to Mazatlan ; and that I should be authorized to proceed to El Paso, where the Commission will be compelled to winter, and obtain from the party at that point a sufficient number of men to man the boats, and proceed with them overland to the port of Guaymas, on the Gulf of California, to which points the boats will be conveyed from Mazatlan in a coasting vessel.

“ From Guaymas we could easily ascend the Gulf in our boats to the point where it would be desirable to commence our examinations.

“ The advantage of this plan will be its economy ; as it will require but a few persons, who may be obtained from the navy, in addition to those who are already drawing pay and subsistence from the government. At present, the number of men forming the main body of the Commission is greater than can be advantageously employed ; while the scarcity of provisions at El Paso, owing to the drought of last season, will make their subsistence enormously expensive during the winter. The horses and mules now belonging to the Commission, will have to be sold at El Paso, or sustained at a heavy expense during the winter : and by employing a portion of them to transport the party to Guaymas, no additional expense will be entailed upon the Survey, as they and the men can be more economically subsisted on the journey than at El Paso.

“The adoption of this plan would incur no additional outlay commensurate with the object in view, which can never be attempted under more favorable auspices. My opinion as to the superfluity of men now with the Commissioner, you will find supported by letters now in your department.

“My views relative to the great expense of subsisting a large party of men and animals at El Paso during the ensuing winter, will be corroborated by Colonel J. Rogers, special Indian agent, who is familiar with the present state of the country; while the opinions which I have expressed, relative to the importance of the explorations proposed by Mr. Bartlett, you can assure yourself of by reference to the accompanying condensed narrative, which, you will observe, confirms the opinion published by the Hon. T. Butler King as to the fertility of the valley of the Colorado, and its future importance to our country.

“To display the feasibility of a journey from *El Paso to Guaymas*, I have also inclosed a narrative of a journey through that region.

“Very respectfully your obedient servant,

“I. G. STRAIN,

“Lieut. U. S. Navy, attached to Boundary Survey.

“HON. ALEX. H. H. STUART,
Secretary of the Interior.”

The distinguished gentlemen then at the head of the Interior Department, ever anxious to promote the cause of science, and particularly where the acquisition of knowledge of our newly acquired possessions was concerned, thought favorably of my suggestion, and the plan of Lieut. Strain, and, as I was informed, would have permitted that officer to carry it into effect. Before, however, he had an opportunity to do so, Brvt. Lt. Col. Graham had been detailed as Principal Astronomer, &c., to the Commission, and Mr. Stuart deemed it proper to refer Lieutenant Strain's letter and papers to him. The plan, strange as it may appear, was objected to by Colonel Graham. In reply, he remark-

ed that it was "an injudicious arrangement, and ought to be dispensed with;" that, although "by the late treaty, our citizens have the right of ingress and egress through the Gulf of California," we might "give offence" to Mexico by the proceeding; and that the expenses attending this Survey could not be legitimately met from the appropriations granted by Congress for the Survey." But the last and most extraordinary assertion is, that such an examination as Lieutenant Strain proposes, in connection with the Survey, should not be intrusted to a naval officer. "I have been frequently engaged on surveys for the last thirty years," says Colonel Graham, "of rivers, harbors, and portions of the sea-coast, and always found the best persons to manage the boats employed on such service, were the *engineers and surveyors* charged with, and responsible for, the execution of the duty." Colonel Graham's letter to Secretary Stuart, embracing his objections, will be found in Appendix E.

As the defeat of my plan has been a serious injury both to government and to commerce, I shall show that, both by the treaty with Mexico and my instructions, I had authority to make the examination referred to.

The sixth article of the treaty of Guadalupe Hidalgo provides, that

"The vessels and citizens of the United States shall, in all time, have a free and uninterrupted passage by the Gulf of California, and by the river Colorado below its confluence with the Gila, to and from their possessions situated north of the boundary line defined in the preceding [Vth] article; it being understood that this passage is to be by navigating the Gulf of California

and the river Colorado, and not by land, without the express consent of the Mexican government."

The United States government, knowing that opportunities would be presented, in the course of the extensive surveys intrusted to me, to acquire important geographical knowledge relating to the immense frontier along the line to be explored and surveyed, fully authorized me to seek such facts. In his instructions to me, the Hon. Secretary of the Interior says: "As the organization of the Commission under your charge has been made for the purpose of collecting information relative to the country contiguous to the boundary line, in addition to the running of that line, it is desirable that you should avail yourself of every opportunity afforded by your passage through the unexplored regions of Texas, New Mexico, and California, to acquire information as to its geography, natural history, &c., when it can be obtained without retarding the progress of the Survey."* My duties required me to send boats to the mouth of the Gila to survey that portion of the river, as well as to carry provisions there for the surveying parties; and I should have been guilty of neglect had I not endeavored to take advantage of this opportunity to examine the upper part of the gulf, and that portion of the Colorado between its mouth and the junction with the Gila. A minute survey of the entire gulf, about which Colonel Graham has made calculations, was not contemplated by either Lieutenant Strain or myself.

The great obstacle to the ascent of the Colorado is

* See Instructions, Appendix.

the tidal wave at its mouth, which has been noticed by all who have attempted to ascend it; and although the United States has been in possession of California six years, no official survey, exploration, or reconnoissance has yet been made of the head of the gulf, or of the river below the Gila.* The want of this is my apology for giving some notices of the entrance of this river by its discoverer and subsequent explorers.*

As early as the year 1540, Fernando Alarchon, in a voyage to explore the Gulf of California, by order of Antonio de Mendoça, Viceroy of New Spain, discovered the mouth of the Colorado. It appears that "the pilots and the rest of the company" made serious objections to entering the river, and proposed that the fleet should return. "But," says the persevering navigator, in his letter to Mendoça, "because your Lordship commanded me, that I should bring you the secret of the gulf, I resolved that, although I had known I should have lost the ships, I would not have ceased for any thing to have seen the head thereof: and therefore I commanded Nicolas Zamorano, pilot major, and Dominico del Castello, that each of them should take a boat, and their lead in their hands, and run in among these shoals, to see if they could find out

* I should do injustice to Major Heintzelman not to notice his efforts to explore the Colorado below Fort Yuma. He was unprepared with instruments for an accurate survey; yet he did make a reconnoissance to ascertain the feasibility of getting his supplies up, which enabled him to lay down approximately the course of the river. I am indebted to him for a copy of this map, which is now in the hands of the engineers of the Commission, and is all the material they possess for making a map of this portion of the country.

the channel whereby the ships might enter in; to whom it seemed that the ships might sail up higher (although with great travail and danger). And in this sort I and he began to follow our way which they had taken, and within a short while after we found ourselves fast on the sands, with all our three ships, in such sort that one could not help another; neither could the boats succor us, because the current was so great that it was impossible for one of us to come unto another. Whereupon we were in such great jeopardy that the deck of the Admiral was oftentimes under water; and if a great surge of the sea had not come and driven our ship right up, and gave her leave, as it were, to breathe a while, we had there been drowned. And likewise the other two ships found themselves in very great hazard; yet because they were lesser, and drew less water, their danger was not so great as ours. Now, it pleased God, upon the return of the flood, that the ships came on float [floated], and so we went forward. And although the company would have returned back, yet for all this I determined to go forward, and to pursue our attempted voyage; and we passed forward with much ado, turning our stems now this way, now that way, to seek to find the channel. And it pleased God that after this sort we came to the very bottom of the bay; where we found a very mighty river, which ran with so great a fury of stream that we could hardly sail against it. In this sort I determined, as well as I could, to go up this river. And with two boats, leaving the third with the ships, and twenty men, myself being in one of them, with Roderigo Maldonado, treasurer of this fleet, and Gaspar de

Castilleia, comptroller, and with certain small pieces of artillery, I began to sail up the river."*

We hear little more of attempts to enter the Colorado until those of the missionaries about the middle of the last century. In 1746, Father Consag made a voyage for the purpose of exploring the Gulf of California. He reached its head, and found the river. "At the entrance," he says, "is a triangular island, which divides the stream into two arms, one in California, running northward, and the other on the opposite side, running north-west. The people went ashore, and found themselves between two rapid currents: one of the rivers ebb, and in the other the sea was flowing in with no less impetuosity, so that they had a very narrow escape."† He attempted to go up the Colorado; but the current was so rapid that the boats could not stem it, and having no ropes to tow them, the project of further exploration was abandoned.

The only attempt in recent times to enter the Colorado before the occupation of California by the United States, of which I have knowledge, is that of Lieutenant Hardy of the British navy.‡ This gentleman was sent out by an English company connected with the pearl fishery in the gulf; and in the course of his explorations he visited the Colorado. He has given us a plan of the mouth of the river, accompanied by soundings; which bears every mark of correctness, with the exception of an error in laying down the river Gila. For this he mistook a small branch falling

* Hakluyt's Voyages, vol. iii., p. 425. London ed. of 1600.

† Venega's California, vol. ii., p. 308.

‡ Travels in the Interior of Mexico. London, 1829, p. 320.

into the Colorado about ten miles up; or it may have been a sluice filled with the rushing water from the tides of the gulf. This latter I think the more probable supposition. The Gila, as I have already mentioned, is known to enter the Colorado at more than a hundred miles from its mouth.

Lieutenant Hardy found two small islands at the mouth of the river, and entered by the western channel; where there was, at the narrowest point, but a single fathom of water, the width varying from ninety to two hundred yards. Owing to the narrowness of the channel, he was obliged to stand in so close to the shore that the jib-boom nearly touched it. The western bank was here high and perpendicular. The tide was running at the rate of nine miles an hour. With all his care, the vessel was thrown on shore, where she lay eight days. The flood and ebb tides swept by with the same velocity; and on one occasion the receding tide left his vessel one hundred and fifty feet from the water. He waited in vain for slack water, in order to replace the rudder, which had been unshipped. "But in the Colorado," he says, "there is no such thing as slack water. Before the ebb has finished running the flood commences, boiling up full eighteen inches above the surface, and roaring like the rapids of Canada."

Since the foregoing was written, I have read an account of the most recent attempt to ascend the Colorado, which is given in the accompanying note.*

* This statement is contained in the San Francisco Herald of June 11th, 1853:

A few weeks before my arrival here, a fight took place between eight soldiers and a body of Yuma Indians, in which the former were all killed. The

Mr. Turnbull left San Francisco in the schooner General Patterson, with stores for the garrison at Fort Yuma. At the mouth of the Colorado he met with a serious obstacle in the number of sand-banks and the high tides. "The tide," he says, "rises from twelve to sixteen feet every twelve hours; the tidal wave, being sometimes four feet high, carries every thing before it. If a vessel strikes on a sand-bank at high tide, she becomes high and dry in a little while, and may remain so for weeks before she can be got off. Fortunately, the General Patterson, shortly after entering the mouth of the river, met a whale-boat containing the mates and four of the crew of a vessel belonging to Mr. Turnbull, which had been lying in the river for several months. They had been engaged in obtaining soundings, and were consequently enabled to pilot the Patterson up, without stopping at every moment to try whether she was over one of the dreaded sand-banks. In this way she ascended the river thirty-three miles in two days, and anchored. No other vessel had ever before made the same distance in less than twenty days. Mr. Turnbull, with a party, took a whale-boat at this point, and ascended the river to Fort Yuma, upwards of a hundred miles.

"The river was swollen almost to a torrent by the melting of the snow at the head waters; and the country for fifteen miles on both sides was entirely inundated, the water standing four feet deep upon its banks. The current was running at the rate of seven or eight miles an hour, and multitudes of floating snags of trees were rushing down. So completely was the country overflowed, that Mr. Turnbull found in a distance of a hundred and twenty-five miles but two dry spots on the banks where he could cook his food. He was obliged to sleep on board his boat, as there was no land to be seen.

"Within a few miles of Fort Yuma, he heard of the loss of the steamer Uncle Sam, which it was his purpose to run regularly on the Colorado. He had brought out machinery for her in the Patterson, which would have enabled him to stem the current of the river, and probably to have ascended considerably above the Fort. He has not yet given up his purpose, and will take the hull of another steamer out, the machinery being still at the Fort."

Indians approached the soldiers, and drew their fire, when a large number, who lay in ambush, rushed upon them with the short clubs which form their principal weapon, and put them all to death. Major Heintzelman in turn sent several parties against them, and drove them all from the banks of the Colorado for some eighty miles above, destroying their corn fields and their villages. They had been so cruel and treacherous to the various parties of Americans passing here, and had manifested so much hostility towards the troops, that it was found useless to attempt to conciliate them, or make any treaty with them, unless they themselves were forced to come in and ask it. They have often made treaties with the Mexicans, only to break them when a favorable opportunity offered to plunder and murder. When Lieutenant Whipple was here, in 1849, with a party of engineers, to determine the point of junction between the two rivers, and establish the monuments on the boundary line, he remained several months among them, on terms of intimacy and friendship.*

One afternoon while here, Major Heintzelman and myself made some experiments to ascertain the velocity of the Colorado below the junction. The result gave us $5\frac{1}{4}$ miles per hour. But it must be remembered

* Since the above was written, Major Heintzelman has been completely successful in reducing the Yumas. He pressed them so hard that they at length came in and begged for peace, which was at once granted them, and a treaty made. They now occupy the rich bottomlands near Fort Yuma, which they cultivate, raising wheat, corn, melons, beans, etc.; and the best feeling exists between them and the Americans.

that the river was then much swollen. When low, it flows at the rate of about two miles an hour. It is then but four feet deep at the fording place at the Algodones, where we first saw it; and at such times wagons, mules, and cattle may easily cross. When the engineering parties crossed here in January, they swam their mules and were taken over in boats by the Indians. By a stake planted below the junction, Major Heintzelman ascertained the rise of the river to have been thirteen feet and six inches, when at its highest point, which it attained on the 13th of June, while the Commission was here.

Four miles below Fort Yuma are the remains of a fortification called Fort Defiance. This is the spot where we first encamped, and were unable to reach the water. It was an old ferrying place, and the scene of a massacre by the Yumas the year before our visit, the particulars of which I will state.

In 1849, when large numbers of people from the United States and the adjacent province of Sonora were emigrating to California, many came by the Gila and crossed the Colorado here. At this time, as there was no garrison on the spot, nor any white settlers, the Yumas derived quite an advantage from aiding emigrants to cross, having by some means obtained a boat or scow for the purpose. A party of Americans, seeing a prospect of a lucrative business by the establishment of a ferry, dispossessed the Indians of their boat, drove them from the river, and would not permit them to help emigrants across or otherwise have any thing to do with them. The leader in this affair was a Dr. Langdon, of Louisiana. The ferry was established at

the rocky spur before alluded to ; upon which, directly on the bank of the river, they built a rude fort wherein they could defend themselves. This, in contempt for the natives whom they had dispossessed of their rights, they called Fort Defiance.

The party which originally established the ferry was fitted out by J. P. Brodie, Esq., a gentleman living at Hermosillo, in Sonora, of whom I have before spoken : he advanced the money for the purpose, and retained an interest in it. While this gentleman had the direction of affairs, no further offence was given to the Indians, and emigrants were always treated well and fairly dealt with. Not long after, however, a man named Gallantin was employed by Dr. Langdon, or in some other way became interested in the ferry. He turned out to be a bad fellow, and was supposed to be a fugitive from justice. He treated the Indians most brutally, and practised all sorts of impositions upon the passing emigrants, charging about four dollars a head for every one who crossed the river. He also extorted large sums from the Sonorians when returning to their homes from the mines, when he found or believed they had any considerable amount of gold with them.

When Dr. Langdon found out the character of Gallantin, he endeavored to get rid of him, but found himself unable to do so. About this time Gallantin took occasion to visit San Diego ; and there his party got into a fight, in which a soldier was killed. Gallantin was arrested and imprisoned, but made his escape back to the Colorado with a supply of liquor. The men having fallen asleep, either from the effects of liquor or of fatigue, the Yumas, who had watched their oppor-

tunity, rushed upon them with their clubs, and massacred every soul at the ferry, embracing some twelve or fifteen persons. Three men were at some distance in the wood cutting timber; these, seeing from the actions of the Indians that something was wrong, succeeded in concealing themselves, and made their escape by joining a party of Mexicans who soon after came along. A large sum of money, all that had been saved by Langdon and Gallatin (estimated at from fifteen to thirty thousand dollars), fell into the hands of the Indians; and this was freely used by them in supplying their wants from the emigrants who afterwards passed. They knew little of the value of gold, and would sometimes give four or five doubloons for an old worn-out blanket, or a gold eagle for a tattered shirt.

No sympathy was felt for the men who had thus lost their lives; but the event tended to encourage the Yumas in acts of violence, in which many innocent and unoffending parties perished. I heard of one occasion on which a party of emigrants crossed while the Yumas retained the ferry. The Indians showed friendship for them, and assisted in making their fires and in taking charge of their animals. The party cooked their meal, and sat down quietly to eat; for although numbers of the Yumas were about their fires and the camp, their presence caused no uneasiness, as they were unprovided with arms. But on a sudden, at a given signal, they each seized a billet of wood from the fire, and knocked out the brains of the Americans.

The ferry is at present well conducted, and though

the facilities for crossing are not as great as they might be, they are perhaps as great as the expenses of carrying it on will warrant. I paid one dollar for each man, two dollars for each mule and ox, ten dollars for each wagon, ten dollars for each wagon load, one dollar for each mule load, &c. The total expense for crossing the Commission and the escort, amounting to five hundred and four dollars.*

Of the Indians who occupy the country near Fort Yuma, the largest and most important tribe are the Yumas. These people occupy both sides of the Colorado both above and below the junction with the Gila. But how far they extend to the north is not known; probably not less than a hundred miles. Of the tribes to the north of them, very little is known. There has

* In consequence of the great demand in California for sheep, large numbers have been driven thither from New Mexico, as well as from Chihuahua and Sonora, all of which cross the Colorado near Fort Yuma. I spoke of the heaps of dried carcasses and skeletons which we saw at Carrizo Creek; but it seems that the desert is not the only difficulty which the owners have to contend with. During the previous winter, the Yumas took advantage of the temporary abandonment of the Fort by the troops, to molest the parties of passing emigrants, particularly when they could rob them of their mules, cattle, and sheep. The most flagrant case, was the loss of 4,217 sheep, belonging to Mr. Joseph White. He had succeeded in getting them over the Colorado in safety, and was preparing to cross the desert. But at this time the Indians began to press them hard, killing and stealing the sheep. To add to the misfortunes of the drovers, their water gave out, and the sheep could not be forced to travel during the day in consequence of the intense heat. The men, to save their lives, hastened on to the water, leaving the sheep until they could return. The Indians, who followed them close, took advantage of their situation, and drove them off; and thus the whole flock was lost.

been no communication with them either by travellers or by the government. The early missionaries who traversed that region have placed on their maps several tribes, whose very names have now disappeared. On the old maps there are found west of the Colorado the *Genigueh*, the *Chemeguabas*, the *Jumbuicrariri*, and the *Timbabachi*, tribes of whose existence in our day we know nothing. The missionaries who mention them, are correct in all their statements, as far as we are now able to judge, and it is therefore probable that there were small tribes bearing the above names. Father Kino, who was here in the year 1700, mentions the *Quiquimas*, *Coanpas*, *Bajiopas*, and *Cutganes*, while the distinguished philologist Hervas, in his "Catálogo de las Lenguas," names many others, the authority for which, is the early missionaries. At Fort Yuma, we heard of a tribe called the *Mohavi*, who occupy the country watered by a river of the same name, which empties into the Colorado about one hundred and fifty miles above the fort. They are said to be a fine athletic people, exceedingly warlike, and superior to the other tribes on the river. On the eastern side, the same missionaries notice the *Tehuas*, *Cosninas*, and *Moquis*. A tribe of the first-named family lived in New Mexico. The *Cosninas* I presume to be the same as the *Coch-nich-nos*, whom Mr. Leroux met in his late journey down the Colorado, although, on account of their hostility, he had no intercourse with them. The *Moquis* are still known, being one of the semi-civilized tribes with which we have had some intercourse. This people cultivate the soil, raise numbers of sheep, live in large villages, and manufacture a superior blanket

both of cotton and wool. The Yumas speak of the *Hawalcos* and *Yampaos* tribes, on the eastern bank of the river, who make blankets. The Mexicans also speak of a tribe called the Tontos, or fools, on the eastern bank of the river; who are said to be allied to the Apaches. It is probable that, with the exception of the great tribes, they are known among each other by different names, which have some connection with the mountains or rivers near which they dwell, or with some peculiarity which distinguishes them from each other. Thus the Yumas are also called Cuchans; and, as I have before stated, the Diegenos, who derive their name from San Diego, are the *Comeya* of early times. It is also certain that many tribes which the missionaries found in California and the northern parts of Mexico, are now extinct.* On the Gila, no tribes have any fixed habitation, nor are any lands irrigated and cultivated, until the district occupied by the Coco-Maricopas and Pimos is reached, two hundred miles to the east. The Yumas occasionally range up and down the Gila, but only on predatory excursions. They strictly belong to the Colorado near the junction with the Gila, where they were found by the earliest explorers.

Between the Gila and the Gulf, and near the latter, there is also found a tribe called the *Cocopas*. They occasionally visit Fort Yuma, and profess to be at peace with the Americans. They are less numerous than the Yumas, with whom they are at war. Recently a party of the Yumas were surprised by them, their chief and

* Of the existing and extinct tribes of Indians I shall speak at length in my Essay on the Ethnology of these countries.

many others killed, and the party completely routed. At the latest accounts the Yumas were preparing for a campaign against them; and as their numbers are much larger, it may result in the annihilation of the Cocopas, who would not be the first tribe which the warlike Yumas have extinguished.

When Lieutenant Whipple was at the junction of the Colorado and Gila rivers, in 1849, engaged in astronomical observations for the Boundary Commission, he was constantly surrounded by the Yuma Indians, and had therefore a good opportunity to observe their habits. He has permitted me to copy from his journal the following notices of them. When he reached the Colorado, he was met by Santiago, one of the chiefs, who conducted his party to their village, where they were surrounded by great numbers of the Indians. "The women are generally fat, and their dress consists of a fringe made of strips of bark, bound round the hips and hanging loosely to the middle of the thighs. The men are large, muscular, and well formed. Their countenances are pleasing, and seem lighted by intelligence. Their warriors wear the white breech; and their hair hanging in plaits to the middle of their backs, is adorned with eagle's feathers, and the rattle of a rattlesnake. They are exquisite horsemen, and carry their bow and lance with inimitable grace." While the party remained at the lower crossing waiting for a road to be cut, the Indians were very sociable, carrying them grass, beans, melons, and squashes; for which, they received in return tobacco or money. They professed great friendship for the Americans, and declared that they "had never stolen from the

emigrants, nor maltreated them in any way; but the Indians higher up, and near the mouth of the Gila, they represented as being a desperate set of rascals." Lieut. Whipple afterwards met the head chief, Pablo, who wore a scarlet coat trimmed with gold lace, with epaulettes of silver wire, and, to crown all, green goggles. His legs and feet were bare, but he did not allow that to detract from the dignity of his manner. At this time the Yumas had extensive fields of maize, and patches of melons and squashes.

When the party under Dr. Webb crossed the Colorado, in January, the good feelings of these Indians towards the Americans had changed. They had already murdered the party of Dr. Langdon and Gallanton, and had had difficulties with several parties of emigrants. Dr. Webb and his companions, therefore, held but little intercourse with them. The Indians ferried them across the river, taking the opportunity to drown a mule or two, which they afterwards secured and ate. At the same time Mr. Pratt took some sketches and portraits of them, and Dr. Webb obtained a complete vocabulary of their language.

I have before stated that Fernando Alarchon discovered and entered the Colorado in the year 1542. The narrative of his remarkable voyage at this early period shows that the zeal for adventure and discovery was quite as great at that period as now. He states that he went up the river eighty-five leagues, which is quite probable; when his further progress was arrested by lofty mountains, through which the river ran, where it was impossible to draw their boats. This was unquestionably the great cañon, where the moun-

tains cross the river, and through which it has worked for itself a deep channel. This cañon is known to all the trappers, and is said to extend from two to three hundred miles, throughout which distance it is only passable in two or three places. As he progressed, Alarchon made diligent inquiries about the country and people. In reply he was told that the river ran much further up into the land than he had yet come ; but his informers did not know its head, as it was still very far in the interior. He learned also that many other streams fell into it. As far as he went, he found the natives cultivating maize. They brought him cakes of maize and loaves of *mezquique*.* Neither wheat nor beans were known to them. To ascertain this fact, our traveller took with him these articles, which he showed the Indians, and at which "they expressed much wonder." He found cotton growing, but nowhere saw any fabrics made of it ; whence he naturally was led to believe that they knew not the art of spinning and weaving. The natives told him that there were twenty-three different languages spoken along the river.

It is a singular fact, that although Francisco de Ulloa explored the Gulf of California in 1539, and Alarchon in 1542, at which time the latter discovered and passed up the Colorado, the fact that California had been ascertained to be a peninsula came to be forgotten, and it was regarded as an island until some time

* I imagine the *mezquique* to be flour made of the mezquit bean, which is now used by the California Indians, as well as by the Coco-Maricopas and Pimos of the Gila.

between the years 1698 and 1701. This rediscovery was made by Fathers Kino and Sedlemayer, two of the earliest and most distinguished of the Jesuit missionaries, who in consequence were able to open a communication by land with the missions of Lower California, which had already been established.* Kino, next to Alarchon, followed up the Colorado beyond its confluence with the Gila; and was the first to preach the Gospel among the Indians, who were then very numerous in this region. He made five separate journeys to the Gila and Colorado Rivers between the years 1694 and 1706; and on one occasion intended to cross over to Monterey, in Upper California, from which he was only prevented by an accident. He established a mission near the mouth of the Colorado and one at the mouth of the Gila. The former did not last many years. The latter was in existence as late as 1776, when Fathers Pedro Font and Garces came with a large party from Sonora to replenish the missions of California, but chiefly that at Monterey.† Fathers Garces and Eirarch remained at the Colorado, and Font proceeded to the coast. Garces afterwards made extensive journeys

* This question seems to have awakened much interest among the geographers of the period. Captain Mange accompanied Father Kino in the journey referred to, and his letter announcing the discovery, with great detail, is given in *Alegro's Hist. de la Comp. de Jesus en Nueva España*. Vol. III.

† I obtained in Monterey, by the kindness of Dr. A. Randall, a copy of the manuscript journal of Father Pedro Font, together with the map which illustrates both the journeys of Font and Garces. The existence of this map was not before known, and it may be regarded as of great value.

up the Colorado, and established a mission among the Moquis. He was soon after killed by the Indians, and the Colorado Mission destroyed.

NOTE.—I have several times spoken of the state of the thermometer. At all times it was placed beneath the shade of a tree, and hanging against it. In no case was it hung in the tent, where the heat was much greater. Our barometers had all been broken before reaching the Colorado, except mine, an aneroid, which I gave to Lieutenant Whipple, in order that his records might be kept complete. So with my thermometer. It was lost, and I was afterwards obliged to refer to Lieutenant Whipple's. Before leaving Fort Yuma, Dr. J. L. Milhau, surgeon of the post, at my request, kindly furnished me with a copy of the meteorological register kept at the Fort for the month previous to my departure, from which I have made the annexed extract:

STATE OF THE THERMOMETER (*Fahrenheit*) at Fort Yuma, at the junction of the Colorado and Gila Rivers, from May 20th to June 16th. Lat. $\cdot 32^{\circ}, 42', 09''$. Long. W. from Greenwich, $117^{\circ}, 37', 09''$.

1852.		Sun rise.	Nine, A. M.	Three, P. M.	Nine P. M.	Daily mean.	1852.		Sun rise.	Nine, A. M.	Three, P. M.	Nine, P. M.	Daily mean.

In this case the thermometer was suspended beneath a thick bower of bushes, which effectually shut out the sun at all times, while there was a free circulation of air around. The Fort stands on an isolated rock about eighty feet above the plain.

CHAPTER XXIX.

FORT YUMA TO THE COCO-MARICOPA VILLAGES.

Leave Fort Yuma—Absence of grass along the Gila—Petahaya or Giant Cereus—Gila trout—Meet the surveying party—Inscribed rocks—Excessive heat—Night marches—Wagons found—How *caches* are made—Particulars of the murder of Mr. Oatman and his wife—Basin of the Gila—More sculptured rocks—Cross the Jornada—Great bend of the river—Another desert—Toilsome march—Reach the Coco-Maricopa villages.

June 17th. Major Heintzelman told me this morning that, from the peculiar barking of the dogs during the night, he believed the Indians had been near the fort. Soon after one of the herdsmen came in, and reported that he had discovered many Indian foot-prints around the base of the hill. The ferrymen, who slept near, were aroused at the same time, and saw from the hill two fires in opposite directions, two or three miles distant, near the banks of the Colorado. They were doubtless intended for signals. A party of soldiers was sent out to reconnoitre in the bottom around the fort; and subsequently a detachment of fifteen, under command of Lieutenant Hendershott, was dispatched on a scout.

Our wagons now being completed and every thing in readiness, we bade farewell to our excellent friends,

and at four o'clock, P. M., crossed the river to our camp on the opposite shore, accompanied by Major Heintzelman. The mercury at noon to-day stood at 100° Fahrenheit.

June 18th. We took our departure at five o'clock in the morning. As Lieutenant Whipple was actively employed in completing the survey of the Gila, my own party was reduced to Dr. Webb, Messrs. G. Thurber, H. C. Pratt, and M. Seaton, which last was returning to rejoin his party on the Rio Grande. We had also, of course, the necessary attendants in servants, cooks, arrieros, and herders; and were accompanied by Lieutenant Paige, with fifteen soldiers. Lieutenant Whipple retained the remaining men of Colonel Craig's command, and twelve of those furnished by Major Heintzelman. Our provisions, baggage, and camp equipage were carried partly in wagons and partly on pack-mules.

We took the travelled road, which we followed for two or three hours along the bottom-land on the south bank of the Gila, and then turned off and followed the trail of Lieutenant Whipple, which led to the river. After pursuing this route a couple of miles, we got entangled in so dense an undergrowth, interspersed with little hillocks and dead trees, that our progress was completely stopped. Fearing that our wagons would be broken if we proceeded, we turned back and attempted to regain the road; but in this direction the same impediments presented themselves. Being thus brought to a stand, I sent men out to find the river, as we had already been so long tugging through the bottom that our mules showed much

weariness. The Gila was discovered within half a mile ; and after doubling the teams to cross a bed of loose sand, we succeeded in reaching it, and there we encamped. No grass was found ; but the mules ate with avidity the cane which grew on the river's banks. Distance travelled, fifteen miles.

June 19th. Left camp at six o'clock ; and after proceeding through loose sand and arroyos, and cutting our way through the jungle which grew near the stream, we reached the road, and soon after a spur of the mountain ridge around which the river ran. In going down a short and steep hill, the king-bolt of one of the wagons broke, in consequence of which we were compelled to unload it, which detained us about an hour. Continuing our journey, we struck the Gila at one o'clock ; where, to our agreeable surprise, we found a small patch of coarse grass, the first we had seen, excepting a tuft here and there on the desert, since leaving San Felipe. For the fifteen days since we left that place our animals had lived almost exclusively upon the mezquit bean, and twigs of willow, cotton-wood, and mezquit bushes. We encamped here, having come twelve miles.

The bottom here does not exceed a quarter of a mile in width, owing to the proximity of the mountains on each side of the river. The vegetation consists of willow and mezquit. We found that Lieutenant Whipple had had a station near us, and had moved forward but an hour before our arrival.

June 20th. Resumed our journey at half-past five in the morning, over a sandy road, and soon after left the bottom and ascended to the table-land, here ele-

vated about forty feet above it. The vegetation consisted of mezquit and palo verde.

After journeying about six miles, we overtook Lieutenant Whipple with the surveying party, and agreed to encamp together six miles further ahead. We proceeded to the point fixed on, which we reached at 11 o'clock and pitched our tents, having made but twelve miles. The bottom-land continued narrow, the desert approaching quite near on both sides of the river. There was no grass; but with cane and mezquit, our mules did very well.

On the northern side of the river, arose a mountain chain about twelve miles distant, presenting a continuation of fantastic summits, among which were three resembling the tops of Hindu pagodas. I took a sketch of these singular mountains; although at such a distance, but little more than the outlines could be discerned.

To-day, for the first time since leaving Fort Yuma, we again encountered our friend the *petahaya*, or Giant Cereus, which we had met with the preceding September in Sonora; and much to our delight, we found it in bloom. The fruit, too, appeared in various stages of perfection. As no full and correct description has yet been given to the world of this extraordinary production of the vegetable kingdom, and as I had the advantage of seeing it at different periods of the year, in flower as well as in fruit, I shall endeavor to give a popular account of it. The buds, flowers, fruit, seed, &c., were collected by Mr. George Thurber, Botanist to the Commission; and by him a scientific description of it will be prepared, with the aid of a distinguished botanist

PAGODA MOUNTAIN, NORTH SIDE OF THE GILA.—p. 188. vol. ii.

who has paid particular attention to the cactacea of North America.

Petahaya.

This curious plant is found on the high table-lands on either side of the Gila, and in various parts of the State of Sonora, growing often in the crevices of rocks, and in other situations where it would seem difficult for any vegetable production to find sustenance. The forms it assumes are various; sometimes rising like a simple fluted column, although more frequently it is furnished with several branches, which, after leaving the main trunk, turn gracefully upwards and rise paral-

lel with it. Sometimes the branches are singularly contorted; but usually, their disposition is symmetrical, and the appearance of the whole plant has been, not inaptly, compared to that of a giant candelabrum. The stem is from one foot to two feet six inches in diameter, usually smaller near the base, and from twenty to fifty feet in height. This immense column is admirably strengthened by a circle of ribs of strong and elastic wood, which are imbedded in the cellular mass of the plant, several inches within the circumference, and extend to the roots. This woody portion remains after the fleshy substance of the plant decays, looking like a huge skeleton. The stem is marked with longitudinal furrows, which are shallow towards the ground, and deeper and more numerous towards the summit; and above the ribs it is thickly set with clusters of spines or thorns. Of these there are six large and numerous small ones, in each cluster. As the plant increases in age, the larger spines fall off, leaving a ray of smaller ones, which lie close to the stem.

Most travellers who have noticed this cereus, have not been fortunate enough to see the fruit and flower, but have derived their accounts of them from the Indians. On our passage across the country in September, October, November, and December, we saw the tree; and on our return in June and July, we had the satisfaction of beholding the fruit in perfection, and occasional specimens of the flower. The plant probably blooms late in May, or early in June; and the fruit is matured in July and August. The flowers are borne on the summits of the branches, are three inches in diameter, and about the same in length. The petals

are stiff and curling, and of a cream-white color. The stamens are yellow and very numerous. The fruit is about the size and shape of an egg; sometimes rather longer than the true egg shape, having a few small scales, without spines. The color of the fruit is green tinged with red, when fully ripe. It consists of an outer coat or skin filled with a red pulp, inclosing numerous small, black, smooth seeds. The fruit, when mature, bursts at the top and exposes the pulp, which at this time is rather mawkish to the taste; but a few days' exposure to the sun dries it to about one third its original bulk, and the whole mass drops out of the skin. In this state it has the consistency of the pulp of a dried fig; and the saccharine matter being concentrated by drying, it somewhat resembles that fruit in taste. The Pimo and other Indians, collect the pulp and roll it into balls; in which state it probably keeps the whole year, as it was offered to our party which passed through in January. They also boil the pulp in water, and evaporate it to the consistence of molasses; after which, it is preserved in earthen jars.*

* It has been supposed that the *petahaya* was first made known by Major Emory in his Notes of a Military Reconnoissance, &c. in 1847: but I shall show that the plant is by no means new, and that it has been noticed by many of the earlier travellers in the region where it is found.

In describing the plants of California, Venegas says, "The principal is the *petahaya*, the fruit of which forms the great harvest of the poor inhabitants here. This tree is not known in Europe, and differs from all other trees in the world: its branches are fluted and rise vertically from the stem, so as to form a very beautiful top; they are without leaves, the fruit growing to the boughs; the pulp resembles that of a fig, only more soft and luscious. In some it is white, in some red, and in others yellow, but always of an exquisite taste; some again are wholly

A number of the fish called by Major Emory the "Gila trout" were caught near our camp by Mr. Pratt with a hook and line. They proved very palatable, where fresh fish is such a rarity; but the flesh is quite soft, owing to the warmth of the water, and would scarcely be tolerated on the tables of the Atlantic coast. "At a little distance," says Major E., "you will imagine the fish covered with delicate scales; but, on a closer examination, you will find that they

sweet, others of a grateful acid. And as the petahaya is very juicy, it is chiefly found in dry soil."—*Natural and Civil History of California*. London, 1759. Vol. I. p. 42.

Father Salva Tierra, one of the most laborious of the California missionaries, and who resided in that country in 1697, speaks of the festivities among the Indians on the occasion of gathering the petahaya. "The three petahaya months," he says, "resemble the carnival in some parts of Europe, when the men are in a great measure stupefied or mad. The natives here, also, throw aside what little reason they have, giving themselves up to feasting, dancing, entertainments of the neighboring rancherias, buffooneries, and comedies, such as they are; and in these whole nights are spent to the high diversion of the audience."—Vol. II. p. 82.

Alcedo has the following article respecting it:

"*Pita Haya (Cactus Pitahaya)*. Arbol grande y muy singular; porque sus ramas son al modo de cirios histriados, que salien derechos desde su tronco acia lo alto, no llevan hoja alguna, y en la misma rama nace pagada la fruta, que tiene la corteza llena de espinas, y se parece algo a los higos de tuna, aunque la carne es mas blanca y delicada; unas la tienen roxa y otras amarilla distinguiendose tambien en dulces y agridulces; pero muy sabrosas. Monardes C da el nombre de Cardin y abunda en el Jardin Botanico de esta Corte.—*Diccionario Geografico Historico*, Tomo V. Appendix, p. 152. Madrid, 1789.

On referring to Monardes, I find his description does not correspond to the Petahaya, whence it is evident he had reference to something else.

But Hernandi, another Spanish botanist, has a very full description

are only the *impression of scales*." I cannot imagine what led to this mistake on the part of the Major; for a mistake it certainly is. Scales were as plainly seen on all we caught as upon any fish; and I found no difficulty in taking them off with my finger-nails from the smallest specimens. We caught them at different times from eight to eighteen inches in length.

After coming into camp to-day, I determined to push on with my party to the villages of the Pimo

of what he calls the *Petahaya Tepexicensis*, which is undoubtedly the plant in question.—See *Historia Plantarum Novæ Hispaniæ*.—Vol. II. p. 170. Vol. III. p. 94. Matriti, Anno MDCCLXXX.

Baron Humboldt says, "At the foot of the mountains of California, we discover only sand, or a stony stratum, on which cylindrical cacti (*organos del tunal*) shoot up to extraordinary heights."—*Polit. Essay on New Spain*, Vol. II. p. 328. This name is probably derived, first, from the flutings of the stem, which resemble the pipes of an organ; and second, from the resemblance which the fruit has in taste to the *tunal*, or Indian fig.

Pattie, an Indian trader and trapper, who spent six years (from 1824 to 1829) in the interior parts of the continent, during which period he passed several times up and down the Gila, says, "A species of tree, which I had never seen before, here arrested my attention. It grows to the height of forty or fifty feet. The top is cone-shaped, and almost without foliage. The bark resembles that of the prickly pear; and the body is covered with thorns. I have seen some three feet in diameter at the root, and throwing up twelve distinct shafts."—*Personal Narrative of Six Years Journeyings, &c.* p. 68.

Again, this plant is mentioned by Lieut. Hardy, who visited Sonora in the years 1825-28. He speaks of a stick which was used for "detaching the fruit from the tops of the petahaya, a plant of the cylindrical cactus species, growing from eight to twenty feet in height." And in another place, he says, "Our route lay over a plain, upon which immense quantities of the petahaya were growing."—*Travels in the Interior of Mexico*, p. 212.

Indians. There seemed to be no necessity of keeping with the engineers, whose progress was, and would continue to be, slow; besides which their duties compelled them to follow all the sinuosities of the river, and keep by its bank. This not only increased the distance, but obliged the parties sometimes to cut passages through the bushes for the wagons and pack-mules, a task attended with much labor, besides the risk of breaking down. Our animals were daily growing weaker for the want of grass; the weather was excessively hot, the mercury ranging every day above 100° in the most shady places we could find; and we were without vegetables of any sort,—a deprivation which already began to show its effects upon the men. For these reasons, I deemed it best for the health of the party and the preservation of the animals to proceed in advance to the Pimo villages, where an abundance of grass and vegetables could be procured. I accordingly made a division of our provisions with Lieutenant Whipple and his party, and left with him such an escort as he considered necessary for his protection.

June 21st. The road to-day was sandy, and consequently heavy, until we reached the table-land. The vegetation continued as before; mezquit, palo verde, and larrea prevailing, and the great cereus occurring with still greater frequency. At one o'clock we struck the river where it passes within two hundred feet of a bold dark-colored bluff, the termination of a short mountain range, which here is about six hundred feet high, and near which we encamped. Estimated distance travelled, seventeen miles. As the weather con-

tinued hot, we endeavored, by making very early starts, to terminate our day's journeys by noon.

A number of fish were brought in to-day by the Mexicans resembling the buffalo-fish of the Mississippi. They drove them into a small nook in a laguna near by, and then rushed into the water and killed them with poles. I ate of them at dinner, but found them soft and unpalatable.

Towards evening, when the sun began to lose its force, I took my sketch-book and went to the base of the bluff, where I had noticed as we passed a number of inscribed rocks. I found hundreds of these boulders covered with rude figures of men, animals, and other objects of grotesque forms, all pecked in with a sharp instrument. Many of them, however, were so much defaced by long exposure to the weather, and by subsequent markings, that it was impossible to make them out. Among these rocks I found several which contained sculptures on the lower side, in such a position that it would be impossible to cut them where they then lay. Some of them weighed many tons, and would have required immense labor to place them there, and that too without an apparent object. The natural inference was, that they had fallen down from the summit of the mountain after the sculptures were made on them. A few only seemed recent; the others bore the marks of great antiquity.

Like most of the rude Indian sculptures or markings which I have seen, I do not think these possess any historic value, as many suppose. Where an ingenious Indian, for the want of other employment, cuts a rude figure of a man or an animal on a rock in some

prominent place which his people make it a practice to resort to, others, with the example before them, endeavor to compete with their brother artist, and show their skill by similar peckings. One draws an animal such as he sees; another makes one according to his own fancy; and a third amuses himself with devising grotesque or unmeaning figures of other sorts. Hence we find these sculptured rocks in large numbers in prominent places. We all had the luxury of a bath here; and though the water was quite warm, we found it very refreshing. We made a practice of bathing wherever we could find water, believing it a better preservative of health than any thing else.

June 22d. The heat had been so oppressive both to the men and animals since leaving Fort Yuma, that I determined to make our marches very early in the morning, or at night. The cooks were accordingly roused this morning at three o'clock, which enabled us to get our breakfast and move off by half-past four. The thermometer at sunrise stood at 69° , the lowest we had seen it since leaving the coast; and after the constant heats we had had, this temperature was uncomfortably cool.

We ascended the plateau to cut off a bend of the river; and after keeping on it for four or five miles, we again descended into the bottom, cutting away a bank in order to reach it. The plateau was as dreary and desolate as before, stretching away as far as the eye could reach to the south in one vast plain, interrupted at intervals of ten or twenty miles with isolated mountains rising abruptly from it. The road now became better, as it wound through a dense thicket of willows

WHITNEY-JOCELYN-ANNIN. S. C. N. Y.

and mezquit, where we could not see our way ten yards ahead; an admirable place for an ambushade, although we had no fear of any thing of the kind. It was an agreeable change from the utter barrenness and parching heat of the table-land to find ourselves now in a thick wood. After passing the northern termination of "Big Horn" Mountain, we completed our day's march, and encamped at eleven o'clock in a thicket of willows near the river. Mr. Leroux, who was in advance, soon after rode into camp with a fine black-tailed deer thrown across his mule, which he had just killed, and which proved delicious eating. We occasionally saw these deer, as well as antelopes, as we passed along; but our numbers and the white-topped wagons alarmed them. Hence it was only by leaving the party and going in advance that our hunters could hope for success.

During the day we passed two abandoned wagons in good condition, save the injury they had received from long exposure to the sun. From one of them we helped ourselves to a king-bolt, to replace the one we had broken a few days before.

From the large quantity of iron strewed about, with fragments of vehicles, tin kettles, and camp equipage, we were evidently at a place where wagons had been broken up and burned. The extent of these traces showed that it was probably the place where General Kearney or Colonel Cooke encamped in 1847. We had discovered their camps in several instances, and many years must elapse before these signs will be obliterated. Distance travelled to-day, eighteen miles.

The mountains here are as desolate and barren as

it is possible to conceive. Not a tree or a shrub could be seen on them, while their bold and abrupt sides are furrowed with huge chasms and gorges. Between the base of the mountains and the bottom-land are low gravelly hills covered with the Spanish bayonet, agave, and various kinds of cacti. Our mules found a supply of cane on the margin of the river, with which, and twigs of willow, they made out to keep up their strength. The Gila here widens considerably, and is proportionably shallow and filled with sand-bars.

June 23d. A violent wind arose last night, which made it necessary to put out guys to our tents to prevent their blowing down. A great change in the atmosphere took place at the same time, so that when I awoke, I found perspiration checked, and was suffering from a severe pain in the head. Others were similarly affected.

Left camp at five, A. M., and soon after ascended the table-land, over which we travelled nine miles, the river as before making a large bend to the north. We could trace its course from the bright green line of cotton-woods and willows, as it wound away through the desert. Passed the grave of an emigrant by the road side, his name being written with a pencil on a strip of board and attached to a tree. Struck the river for a moment, and again took to the table-land, which we followed for about nine miles. We descended where the valley seemed to expand to the width of nearly three miles, above one half of which was thickly wooded with cotton-wood, mezquit, and willow. Here we encamped, on the spot where parties had been before. Near by was a lagoon, which had the appear-

ance of having been recently filled with water. It was now dry, except in a few holes which had been dug to obtain it. We found the water in these holes quite brackish, and unfit to drink; consequently we were obliged to send our animals about a mile and a half through the wood to the river, from which we also brought water for our own use. So thick was the wood, that it was found impracticable to force our wagons through. This was the most beautiful spot we had encamped in since leaving the little valley of San Isabel, in California. We pitched no tents, finding a better and more agreeable protection in the thick and overhanging willows, the leaves of which extended to the ground. Beneath these bushes we were well sheltered from the sun, and passed the most comfortable day we had yet experienced along the parched regions of the Gila. Distance travelled, eighteen miles.

We opened a *cache** in the bank here, in which Dr. Webb had buried a quantity of things, when the party under his charge passed down the Gila in December last. Every thing was found safe and in good condition. The wolves had smelled something below the surface, although there were no provisions there, and had dug up and exposed a corner of the tent in which the articles were enveloped. Had either travellers or Indians been here since, they would have car-

* *Cache*. (French). A cavity or hole in the earth, in which travellers bury their provisions or goods. The word is used by the Hudson's Bay traders, and by the hunters and trappers of the prairies, and the Rocky Mountains, even to the shores of the Pacific.

ried the investigation further. A great deal of property has thus been buried by parties crossing to California, in the hope that they or their friends might at some future time recover it; although it is safe to say that of every hundred *caches* so made, not five are ever opened afterwards.

In making a cache, it is best to select a spot within fifty feet of a tree, rock, or other prominent object, from which the distance can be measured and the bearings taken. A hole is then dug to such depth as may be required to bury the intended articles, which are to be protected by cloths or boards when necessary. When the hole has been covered over, the earth or sand that remains is scattered about or removed, so as to leave no indications of what has been done. It is well to build the camp-fire immediately over it, as that will account for the disturbance of the ground, and the foot prints about the spot. It is never prudent to make a cache beneath a tree, or in a spot where the party can be watched by Indians or others lying in ambush. When Fort Yuma was abandoned a few months before our arrival there, as it was expected to be re-occupied, many articles which the garrison did not wish to remove were thus hidden. But on their return, they found that their place of concealment had been discovered by the Yumas, and every thing carried off.

June 24th. As the soldiers, being all on foot, were greatly fatigued by their yesterday's march, I determined to allow them until evening to rest, and endeavor to make a march in the night. There was here a little salt grass and cane about the lagoon, with willow

bushes for the animals ; and for ourselves, every luxury that a camp life affords.

Accordingly, as the sun began to throw its long shadows across the hills, and when about half an hour of daylight remained, we moved from camp. The road was pretty good and less sandy than before. We did not now take the table-land, but kept on a lower terrace, which seemed to lead along the spur of a dark rocky hill, until we were suddenly brought to a stand. The river had washed away the terrace, and left no passage. We were therefore obliged to retrace our steps a short distance, and pass over the hills, which were exceedingly rocky, and overgrown with *cacti*. Not being able to discern the smaller ones among the rocks, the mules were several times stopped by coming in contact with their thorns. From one poor creature the blood flowed as though he had been purposely bled ; many of the men, too, had cause to remember this night's march among the *cacti*. At two o'clock, the moon, which until then had given us a faint light, went down, when we were compelled to stop, as it was impossible to find our way through the light and deep sand in which we then were. The packs were accordingly removed from the mules, although the saddles were left on ; and the wagon-mules were tied to the mezquit bushes near. We then lay down on the bare sand just where we were, and, rolling our blankets around us, for it was quite cool, slept soundly until daylight.

June 25th. With the break of day we were again off, having no mules to catch, no tents to strike, or breakfast to get. In an hour and a half we struck a

sluice of the river, where we encamped. There was no appearance of grass here; but with plenty of willows and cotton-wood, the animals seemed content. As we were all fatigued from our night's journey, we threw ourselves on the sand, and, after a couple of hours' sleep, awoke quite refreshed, and ready for our coffee and breakfast.

All about us we found signs that a large encampment of Americans had been here, with indications of a *cache*. These were the tires of two wheels straightened and inserted so deeply in the ground that they could not be withdrawn. They were probably land marks, from which bearings had been taken and distances measured. There had evidently been a great breaking up of wagons and destruction of property here. The day was very hot, and rendered more oppressive by the bare sand around us. The bottom land was broad, and but partially wooded. Near us was a sluice, which had been filled when the river was high, or it may have been a bend of the river through which the water had flowed. We did not see the river. Just before sunset, we resumed our journey, continuing a few miles along the river bottom where the road was good. We then ascended about one hundred and twenty feet to a plateau, up a very steep and rocky way, where I much feared our wagons would be crushed; but by the soldiers taking hold, and every man pushing and pulling, we at length surmounted the hill. The road was now hard and smooth, until we came to an *arroyo*, which we had to descend, and then cross over steep and rocky hills, which again endangered the wagons. On reaching the crest of the table-land,

where we descended to the second terrace or bottom, we saw numerous fragments of trunks, boxes, clothing, wagons, with human bones and skulls, showing that it had been the scene of some terrible disaster. A soldier of the escort from Fort Yuma revealed to us the mystery.

In March of last year (1851) a party of emigrants, in crossing the continent, stopped at the Pimo villages. Among them was a Mr. Oatman and his family, consisting of his wife, two daughters from 12 to 15 years of age, and a son of 12 years. Mr. O. had with him one or more wagons, and a variety of merchandise; and, contrary to the advice of his friends, he set off from the village in advance, the rest of the party not being ready to accompany him. Some days after, his little son found his way back to the Pimo Indians, a distance of some seventy miles, having crossed a desert of forty-five miles without water on his way. He reported that the party had been attacked by Indians, his father and mother killed, and his sisters carried off. He himself had been badly beaten by the savages and left for dead. After lying some time, he revived; when he saw the mangled bodies of his parents before him, his sisters gone, and the wagon plundered of its contents. The party soon after set out on their journey, accompanied by the lad and some Maricopa Indians. On arriving at the scene of the disaster, they covered the remains of Mr. Oatman and his wife with stones (for it was impossible to dig a grave), and then continued their journey to Fort Yuma, where they informed Major Heintzelman of the occurrence.

The Major immediately despatched a party of sol-

diers with provisions for those still behind, and with orders to scour the country, and endeavor, if possible, to recover the missing girls. But they saw no Indians, nor has it yet been ascertained by what tribe the outrage was committed.

We reached the valley again at 11 P. M., when we stopped for the remainder of the night, and lay down on the sand to get a few hours sleep. The air was so dry and hot, that tents were unnecessary.

June 26th. Finding no grass, cane, or bushes near us on which the animals could feed, we moved off, soon after 4 o'clock, with the break of day. Our route now lay across a bed of sand so light that the wheels sank deep, rendering it necessary to double one of the teams before we could pass it. Even with the aid of this device, it was slow work. It now became necessary to cross the Gila, as the plateau rose abruptly from the margin of the river, not leaving a passage wide enough for a mule. Our route had hitherto been wholly on the south side since leaving the Colorado. I do not think the north side would present as good a road; besides which, it would be necessary, if the north bank should be followed, to cross the Gila at its mouth, as the Colorado cannot be forded above the junction.

The river where we crossed was about three feet deep in the channel. After getting over, we had to traverse another half mile of deep sand, and then recross, to get on the southern bank once more. At the second crossing my wagon sank so deep in a quicksand, that the mules, after struggling in vain to pull it out, broke the traces and left me alone in the middle of the stream. It was necessary to attach four mules

to it before it could be drawn out. We now continued another half mile near the base of a black-looking rocky bluff without a tree to shade us. I thought it best to stop here, as we could not reach the next bend in the river before the sun would be too far up to travel. The bottom-land, or valley, which is visible

Basin of the Gila.

from the summit of this bluff for twenty miles, is altogether sand, with a few clumps of willows on the margin of the river. Not an acre of arable land is visible. The bluff, which is but the termination of the plateau or desert, rises about one hundred and twenty feet above the bed of the stream. The river from here is quite open on the north and west, so that the moun-

tains on the Colórado which we saw at Fort Yuma were distinctly visible.

In order to examine some sculptured rocks of which I had heard, I left camp at 5 o'clock P. M. accompanied by Doctor Webb, in advance of the train. After crossing a plain for about five miles, we reached the object of our search, which consisted of a pile of large boulders, heaped up some forty or fifty feet above the plain, and standing entirely alone. Such of these rocks as present smooth sides are covered with sculptures, rudely pecked in, of animals and men, as well as of various figures, apparently without meaning. There are hundreds of them so ornamented, showing that the place has long been the resort of the Indians for this purpose; for there seems to be nothing else to attract them here. Many of the inscriptions, like those before described, bear the stamp of great age, others having been made over them repeatedly, rendering it impossible to trace out either the early or the later markings. I selected thirteen, of which I made copies. By this time the shades of night were falling about us; and the train having already passed, it was necessary to hasten on to overtake it. I regretted that I could not spend the day in this interesting locality, in order to copy more of the sculptures, as well as to make a closer examination of the many recesses among the rocks. I do not attempt any explanation of these rude figures, but must leave the reader to exercise his own ingenuity in finding out their meaning, if any.

Leaving this place we entered an arroyo of gravel; and after following it for two or three miles, we ascended a very difficult and rocky hill to the plateau.

SCULPTURED ROCKS, RIVER GILA. NO. 4

WHITNEY-JOCELYN-ANNIN Sc. N.Y.

SCULPTURED ROCKS, RIVER GILA. NO 6.

A spur or projection of this hill had to be crossed ; and then, by an easy slope, we again descended to a lower terrace. After marching about eighteen miles, by the bright light of the moon, we stopped the train and bivouacked in the sand till morning, without turning out the mules.

June 28th. We rested comfortably on our sandy beds, and resuming our march before five o'clock this morning, reached a bend in the river four miles distant. As the soldiers had had a tedious march during the night, and evinced much fatigue, I concluded to remain here during the day to give them rest.

Our camp was in a very dense thicket of willows and cotton-woods near the river's bank, into which we cut our way with axes. Here we had an admirable retreat, whose recesses the rays of the sun could not penetrate ; and we passed the day with some degree of comfort. The Gila rippled close by ; and a deep hole being near us which we thought might have some attractions for trout, should any stray this way, we rigged our lines, and the experiment was rewarded with several fine fish.

In the night we were aroused by the firing of a gun. Every one sprang from his bed, believing an enemy near ; but it proved to be an accident. One of the Mexican arrieros, in attempting to pull his rifle out from a pile of saddles with the muzzle towards him, having caught the trigger and discharged it. The stupid fellow narrowly escaped with his life, for the ball passed through his hand.

Soon after five o'clock, P. M., we resumed our journey ; and after a march of eight miles across a bend,

we again struck the river near a point where our surveying parties had had a station, and had remained several days. There we found an abundance of mezquit and willows, but no appearance of grass. Near us was a sluice, which a year before was the main branch of the river, the stream having since found another channel. We bivouacked at this place, doubtful whether we should find as good feed for the mules by proceeding further, the mezquit beans being now in the best state for the animals.

June 29th. Before the sun had risen we were again on our way, intending to stop at the last watering place, five or six miles in advance. My desire was to keep the animals fresh and in good condition for the march across the long desert which lay before us, and to give the soldiers a day's rest before setting out. The Gila here makes a bend to the north, and is not again seen from the road until it reaches the Cocco-Maricopa villages, forty-five miles distant. As there is no water the whole distance, the journey must be made in one march, without stopping; to prepare for it, therefore, we encamped for the day in a mezquit grove near the river.

The kegs and canteens were filled with water preparatory for the journey; and in order to give the soldiers a little the start of us, they set off at four o'clock. The train left an hour and a half later, our course being east by north. We entered at once upon the great plateau or desert, where the road was level and hard. The animals moved off at a quick gait, and had seemingly got the idea that they were approaching grassy fields. About fifteen miles brought us to

a mountain range which had long loomed up before us, and seemed to present an impassable barrier to our progress; but as we drew near, what appeared at a distance to be continuous, now showed many passages through, of easy access, and with an ascent so gradual as to be scarcely apparent. The great mountain chain, as it seemed to us to be, was in reality a collection of detached ridges and isolated mountains rising abruptly from the desert. We were accordingly able to keep on our course, winding through these mountains with scarcely an ascent or descent worth naming. The road was excellent through all the defiles; although there were many small gullies requiring care in crossing, and which shows that there are very heavy rains here at times.

The vegetation on this desert is the same as on the several portions we had from time to time passed over in our journey from the Colorado. The great cereus here raises its lofty head above all other plants, attaining its greatest perfection in this barren and desolate region. We passed several of gigantic dimensions, and others of a variety of forms, exhibiting singular contortions. If one unused to these remarkable plants should suddenly be brought to this place, where he would see before him a vast plain studded with thousands of these cacti, many of which rise to the height of twenty or thirty feet, in a single stem without a branch, he would be very likely, particularly if he saw them as we did by moonlight, to imagine himself in the midst of the ruins of a magnificent palace, the columns of which were alone left standing. The lesser plants, thinly scattered over the plain, are a dwarfish

mezquit and larrea Mexicana, with an occasional palo verde in the arroyos.

Towards midnight, the pack-mules passed me; for up to this time I had been in advance. I had observed before, that in long marches, when the wagon-mules became fatigued, those with packs would quicken their pace. My wagon-mules, unwilling to be left, increased their pace, and I allowed them to keep just far enough behind the packs to avoid the dust. As there was no stopping the pack-mules without relieving them of their burdens, Mr. Leroux said it would be far better to push on until we reached the water and grass; and I determined with my little wagon to keep with him. It was now about two o'clock, and the soldiers as well as the horsemen were so much fatigued, that the wagons were stopped, and all threw themselves down just as they were to get a little rest on the bare desert, hitching their mules to their waists by their long lariats. I left them, and hastened forward with Mr. Leroux and the packs.

June 30th. At daylight we passed the south end of a range of mountains which extend to the Gila, terminating near the mouth of the Salinas River; and at half past six we reached some water-holes, about a mile from the first Coco-Maricopa village, thus making the journey of forty-five miles in thirteen hours. This may be considered slow in the age of locomotives and steamers, or even with stage-coaches; but with a train of emaciated pack-mules, each carrying on his back two hundred and fifty pounds weight, and going the whole distance without a particle of food or water, it is something of a feat.

It was indeed a pleasant sight to find ourselves once more surrounded by luxuriant grass. Although we had met with a little salt grass in one or two places on the march, which no animal would eat if he could get any thing else, we had not seen a patch of *good* grass since leaving our camp at San Isabel, fifty-six miles from San Diego. At Vallecita and Carrizo Creek it is indifferent.

As it would yet be several hours before we could look for the wagons and the remainder of the party, we turned the mules out to luxuriate on the rich pasture before them, and creeping under some mezquit bushes soon fell asleep, rest being more desirable than food.

The wagons with the rest of the party, including the escort, came in at half-past ten. We now got out all the tents, and arranged our camp with much care, as we were to be here for some days, to await the arrival of Lieutenant Whipple and the surveying party. We selected a spot in which there was a pretty grove of mezquit bushes, and there we pitched the tents. The water here is found in several holes, from four to six feet below the surface, which were dug by Colonel Cooke on his march to California. In some of these holes the water is brackish, in others very pure. The Gila passes about two miles to the north; for one half of which distance the grass extends, the other half being loose sand. Major Emory, in his report,* recommends parties going to California by this route not to cross the plateau which we had just come over, but to keep to the river, as "the journey is but

* Notes of Military Reconnoissance, p. 89.

a trifle longer." The accounts on which he bases this recommendation were erroneous, the route along the river being more than double the distance, as reported to me by the engineers whose duties required them to follow it. It is besides thickly wooded, and would present difficulties to wagons, and even to pack-mules; whereas the road over the plateau which we took is excellent all the way. It is also proper to state, that Lieutenant Whipple and Mr. Gray found the bend of the river to be much greater than it is laid down by Major Emory on his map.*

* Mr. Gray in his official letter to the Secretary of the Interior, from San Diego, relating to the survey of the Gila, says, that "many errors of others who had been along this river, in astronomical observations, were corrected by Lieutenant Whipple."—*Senate Doc. No. 119, 32d Cong. 1st Session*, p. 307.

It may be mentioned in this connection, that the survey of the Boundary Commission brought to light two important geographical facts. One was, that the Colorado, after receiving the Gila, takes a sudden turn of seven or eight miles to the westward before resuming its southerly direction, which turn gives the United States both banks of the river. The other was the error in laying down the great bend just below the mouth of the Salinas. Yet both these supposed discoveries were made by Father Kino before the year 1700, although they never obtained a place in the maps; for in speaking of this eminent missionary and geographical explorer, Alegre says: "En este viage observó el padre Kino dos cosas, entre otras: la primera que el Gila como á 55 grados de San Gerónimo, despues de haber corrido cuasi constantemente al Owest, vuelve como por espacio de ocho leguas al Norte. La segunda, que despues de juntos el Gila y el Colorado, corren por doce leguas al Poniente antes de volver ácia el Sur á desembocar en el Seno Californio."—*Alegre Hist. de la Compañia de Jesus en Nueva España*. Tom. iii. p. 119.

CHAPTER XXX.

THE COCO-MARICOPA AND THE PIMO INDIANS.

Visit from the Coco-Maricopa Indians—Camp removed to the banks of the Gila—The river dry—No grass—War party—Return to our first camp—Traffic with these Indians—Further accounts of the Oatman family—Francisco the Maricopa interpreter—Feeding the tribe—Visit from the Pimos—Religious notions of these tribes—Their manners and customs—Agriculture—Art of spinning and weaving—Manufactures of cotton—Pottery—Basket-work—Dress—Their attempts at collecting zoological specimens—Villages—Houses and mode of building—Store-houses—Horses and cattle.

IN the afternoon our camp was filled with the Coco-Maricopa Indians, who had discovered us from some of their look-outs. They all manifested a friendly disposition, and seemed very glad to meet among us so many of their old acquaintances, several of the party having spent some days among them while engaged in surveying the river. The most active and important man among them was a chief named Francisco Dukey. He had been in various parts of Mexico and California, spoke Spanish fluently, and acted as our interpreter. There were three or four others who had lived for some time at Tucson, where they had picked up sufficient Spanish to make themselves understood.

I told them we wanted vegetables, fruit, green corn, and mules; for which we would pay them in white cotton cloth, calico, red flannel and other shirts, blankets, and trinkets. They generally raise a great many fine melons; but it was too early yet for them. They brought us green corn, squashes, beans, and dried peas. We also bought of them some dried corn (maize) for the animals.

The culinary department, as usual, seemed to have most attractions for our Indian friends, who formed a double row around the fire while cooking was going on. They also crowded into the tents, and occupied all the space about them. When night came, we expected they would leave; but they stretched themselves out on the grass, and passed the night in the camp.

June 30th. As the heat was intense, the mercury ranging from 100° to 110°, and as we had very little shade, it was thought advisable to get nearer the river, where there were more trees, and where the men would have a better opportunity to bathe, a luxury which they had enjoyed every day since leaving Fort Yuma. The Indians told me we had better remain where we were, as there was no grass near the river. I felt disposed to listen to them; but such was the desire of the party to be on the water that I consented to go, and gave orders to strike the tents immediately after breakfast.

By eight o'clock we set off, under the guidance of Francisco, and followed by fifty or sixty more of his tribe. After crossing a deep arroyo of sand, which is filled by the river at its floods, and pushing our way

through a thick underbrush of willows, we at length reached the bank of the river, when I found the statements of the Indians too true. There were many fine large cotton-wood trees, beneath which we stopped, and which afforded us a good shade from the scorching rays of the sun; but there was not a blade of grass to be seen, and, what was worse, *the Gila was dry!* We crossed and recrossed its bed without wetting the soles of our shoes; although by digging a couple of feet, we found water for ourselves and our animals.

We now turned the animals loose to browse upon the twigs of the willows and cotton-woods, as there was no other food for them; and I sent Mr. Leroux up the stream, in search of the two great desiderata for the party, grass and water, and shade if it was to be found. In three or four hours, after making a diligent search through the bottom, he returned and reported that the river was dry as far as he had followed it, and that he had met with no grass. In fact, he was told by the Indians, that we should find no grass until we passed the Pimo villages, from twelve to fifteen miles beyond. It was so hot and dry where we were, that we did not pitch our tents, having concluded to retrace our steps in the morning to our first camp at the water-holes.

The dryness of the river was produced by the water having been turned off by the Indians to irrigate their lands, for which the whole stream seemed barely sufficient. It is probable, however, that, with more economical management, it might be made to go much further.

A party of the Coco-Maricopas remained with us

to-day, who were to set off in the morning on an expedition against their enemies, the Apaches, north of the Salinas. They were gayly dressed, as is the universal custom of the Indians on such occasions, and mounted on good-looking horses. The chiefs who were to lead the band begged hard of me to lend them a few rifles with the necessary ammunition; which I had to refuse. As an additional inducement, which they thought I could not refuse, they offered to bring me a live Apache boy, and a girl too, if I wished; but having no desire for such additions to our party, I was compelled to decline the generous proposal.

July 1st. Our Indian friends composing the war party were up at daylight preparing for a start. They seemed to be supplied with small loaves of bread and dried meat, of which they made their morning's meal. They then decorated themselves with all the finery they could muster. Most of them had shirts of white cotton or red flannel, which they had obtained of us, and which they seemed to regard as the beau-ideal of a dress, without the addition of any other garment. Such as had their own cotton blankets, placed them around their bodies in folds, and over this wound their lariats as tight as possible; for the double purpose, I suppose, of bracing their bodies, and of protecting their vital parts from arrows. Those who possessed neither shirts nor blankets, remained as nature made them, with the addition of a little paint. On their head dresses, they had all bestowed more attention than on their bodies. Some had them plastered with clay, so as to resemble huge turbans. Others had decorated the great club of hair which hung down

their backs with bits of scarlet cloth, but more of them with the richly-figured sashes or belts of their own manufacture. Some again wore their hair in braids tastefully wound around their heads, intermingled with pieces of scarlet cloth; while a few, less particular as to their appearance, wore it clubbed up behind in a huge mass. The manes and tails of their horses were also set off with bits of white and red cloth. Their arms were solely the bow and arrow: most of them had a skin quiver hung across their backs; though a few carried their arrows in their girdles. There was quite an exciting time as the party were about to start; and several of the Commission desired to take their rifles and accompany them, a request which was of course refused.

Wishing to get back to our old camp in the cool of the morning, we did not wait for breakfast, but were off by five o'clock, and, after another hard tug through the sand, reached the camping ground, where we had every thing we could ask for, except shade, and water to bathe in. The latter was the greatest deprivation. The tents were again pitched, and the camp arranged as it was on the day of our arrival.

The Indians again flocked around us, and in greater numbers than before. The Pimos having heard of our arrival, many of them came also, bringing such vegetables as they had, together with *pinole*, made both from wheat and corn. Some of the pinole was sweetened with the flour of mezquit beans, which they also brought separate in small earthen vases, or *ollas*, as the Mexicans call them. The mezquit flour, which is ground very fine, has a sickish sweetness; so that, although I

became fond of the beans in the pod, and liked to pick them from the trees as we rode along, I could not eat them when dry and converted into flour. They also brought us the fruit of the *petahaya* rolled up in masses or balls as large as one's fist. In this state it resembles in appearance the pulp of figs, and has something of the same taste mingled with that of the raspberry. We had gathered some as we came along the Gila, but had found none so good as this. All became very fond of it, and our Indian friends found a ready sale for all they brought. Jars of molasses extracted from the same were also offered for sale.

I inquired of the Indians to-day what they knew of the murder of the Oatman family before mentioned. They remembered the affair well; indeed one of the chiefs present had accompanied the party after the committal of the murder. His statement corresponded with what I have related. They charged the Tonto Apaches with the crime, and said, "With God's permission, we will retake the two children, and restore them to the Americans." I told them they should be well rewarded, if they would do so; and that if so fortunate as to recover them, they might take them to the American Fort (Yuma) on the Colorado; or if they could not carry them there, to the Mexican commanding officer at Tucson.

Among the Maricopas, I noticed to-day three whom I had seen in Ures when there last winter, and to whom I had given notes of recommendation. They now showed them to me carefully wrapped up in several envelopes, and deposited in a bag of black skin. All the chiefs, both Pimos and Coco-Maricopas, have let-

ters which they have obtained from passing emigrants, recommending them to the favor and kind treatment of others. They prize these certificates very highly.

July 2d. This morning, Francisco, the Maricopa interpreter, breakfasted with me, and, from his ease at table, showed that he had been among civilized people before. He was well dressed, having on pantaloons, a shirt, and hat. He is a man of much intelligence and shrewdness, and expressed a desire to serve us. The Americans who had been through these villages before, he said, had given his people very little, although they had done much for them. They had brought the Americans wood and water, and had acted as guides, sometimes accompanying them many miles, and he himself had acted as interpreter for all parties, but had received little or nothing in return. Besides this, his people had often given corn, melons, and vegetables, to ours; but the Americans had told them they were very poor (as they doubtless were), and had neither clothes nor goods with which to reward their kindness. He said they sometimes received money from the Americans; but it was of little use to them, as they wanted *manta* (white cotton) and shirts. I told Francisco, in reply, that those he referred to were mostly families of poor emigrants, who had left their homes, and were going to California in the hope of doing better; and that before I left, if his people conducted themselves well, I would not only pay him for all I received, but would make him and the other chiefs of his tribe presents, to induce them to treat all other Americans who might pass their villages with kindness, and supply them with what they could spare.

There was one practice of this chief that was not so agreeable to me, namely, that of helping his friends to the choicest bits from my table. When we took our places, they all assembled, and sat or stood gaping around. Francisco, during the meal, occasionally handed them a piece of bread or meat; and when we had finished, he coolly piled up his plate, and passed it around among his friends. At first, I was rather amused at the fellow's impudence; but on a subsequent occasion, he carried the joke still further, not only giving them what he had collected on his own plate, but stripping the table of all that remained, so as to leave nothing for my cook and servant. As our supply of provisions was limited, I had no idea of feeding so many hungry mouths, which had an abundance at home; consequently my second invitation to the chief, was the last. Yet he made his appearance regularly every morning while we remained, and gave many hints about being hungry, expressing his surprise to the cook that he did not have a seat at my table. I told him, finally, that it was not the custom among Americans, when they asked a friend to their table, to feed his whole tribe.

This man afterwards became quite a bore to us; for nothing would satisfy his avarice. I gave him shirts, pantaloons, white cotton, and calico, besides beads and trinkets for his wife and children. Lieut. Paige, also, made him some valuable presents; but he constantly asked for more, and was most importunate for *whiskey*. I told him we had none; but this he seemed to doubt, declaring that we were the first party of Americans he had ever seen that did not drink whiskey. Every

junk bottle he saw about my tent or wagon, was suspected to contain the forbidden liquor; and nothing would satisfy him until he examined them himself. After finding in one lemon syrup, in another vinegar, and in a third a mixture for diarrhœa, which communicated an unpleasant pucker to his mouth, the fellow gave up all hopes of obtaining the object of his search. Much harm has been done by Americans in giving this poor and simple-hearted people intoxicating drinks; and it is a matter of satisfaction to me to state, that in my long intercourse with the Indians here, as well as at the Copper Mines with the Apaches, none ever got a drop of liquor from me, or from my camp to my knowledge.

In the evening, while a crowd of Indians were lying or squatting around my tent, I had a long talk with a Maricopa, whose name I forget (but who spoke Spanish well), on the manners and customs of his people. This man was terribly crippled, having a year before been engaged in a fight with the Yumas, in which his party was defeated. He was lanced in many places, beaten with clubs, his hair cut off, and left for dead. After the combatants had left, he revived, and by some means succeeded in getting home. He was still unable to walk, except with a long staff, but had to be lifted on his horse, and rode about with some difficulty. He was quite an intelligent man, and, while we remained, was constantly in our camp.

He said the Coco-Maricopas came here not many years before, to escape from the Yumas, with whom they were constantly at war, and by whom they had been greatly reduced in numbers. Their former range was along the valley of the Gila, on the opposite side

of the Jornada and towards the Colorado. Their present position adjoining the Pimos, was chosen for the benefit of mutual protection.

This people restrict themselves to a single wife. Their ideas of a Supreme Being, in whose existence they believe, are of so vague a nature that I could not ascertain them with exactness. After death, they believe that their souls go to the banks of the Colorado, their ancient dwelling-place, and there take refuge in the great sand hills, where they are metamorphosed into various animals and birds. Their heads, hands, feet, etc., each become owls, bats, wolves, and other animals. They believe, too, that the souls of their enemies, the Yumas, also find a place there; and that the wars which have so long existed between them on earth, will be continued there, after death.

When a man desires to marry, and has made choice of a girl for his wife, he first endeavors to win over her parents by making them presents. The fair one's attention is sought by another process. To do this, he takes his flute, an instrument of cane with four holes, and, seating himself beneath a bush near her dwelling, keeps up a plaintive noise for hours together. This music is continued day after day; and if no notice is at length taken of him by the girl, he may "hang up his flute," as it is tantamount to a rejection. If the proposal is agreeable, the fair one makes it known to the suitor, when the conquest is considered complete. No girl is forced to marry against her will, however eligible her parents may consider the match. Whenever a girl marries, it is expected that her husband will present her parents with as much

as his means will permit, to compensate them for the loss of their daughter, whose services are to them a matter of consequence.

Indian Flute, and Rattle of Deer's Hoofs.

Among both the Coco-Maricopas and the Pimos, the women do the principal part of the work. Besides taking care of the children and attending to the household matters, they grind the corn, make baskets, gather mezquit beans, help till the ground, and sometimes spin and weave.

The men plant and gather the crops, and take care of the animals. This I believe is all they do; and as the performance of these duties is not a very onerous task, they are idle the greater portion of the time. Their implements of husbandry are steel hoes and axes which they obtain from the Mexicans, harrows, and occasionally a long-handled spade. Grinding corn on the *metates*, or stones, is a work of great labor, and comes hard on the poor women, who are obliged to get upon their knees, and exert the whole strength of their arms

and bodies in the task. I have seen women thus employed when the thermometer stood at 110°, while their lords lay stretched out at length on their backs looking on.

Water is invariably brought by the women in large earthen vessels upon their heads resting upon a small cushion. Some of these vessels hold six gallons. This mode of carrying burdens, by which the body is kept in a perfectly erect position, tends greatly to develop the chest and add to the general beauty of the figure. Hence we see among the Indians, as well as among the lower class of Mexicans, forms which Walker might well have taken for models in his "Analysis of Beauty in Women."

As the manners and customs of the Pimos and Coco-Maricopas are the same, with the exception of their rites of burial, I shall include both in describing these customs; although there is little doubt but that the knowledge of the arts which they possess originated with the Pimos. Cotton is raised by them,* which they spin and weave. Their only manufactures consist of blankets of various textures and sizes; a heavy cloth of the same material used by the women to put around their loins; and an article from three to four inches wide, used as a band for the head, or a girdle for the waist. The blankets are woven with large threads, slightly twisted and without any nap. They are made of white cotton, and are without ornament of colors or figures, save a narrow selvage of buff.

* I brought home with me the seeds with samples of this cotton, which was pronounced equal to the best Sea Island. The seeds I distributed among various planters.

The implements used by these tribes for spinning and weaving are of the most primitive character. A slender stick about two feet long passing through a block of wood, which serves to keep up the momentum imparted to it, constitutes the spindle. One end of this rests on a wooden cup inserted between the toes,

Indian weaving.

and the other is held and twirled by the fingers of the right hand; while the left hand is occupied in drawing out the thread from the supply of cotton, which is coiled upon the left arm in loose rolls.

In weaving, the warp is attached to two sticks, and

stretched upon the ground by means of stakes. Each alternate thread of the warp is passed round a piece of cane, which, being lifted, opens a passage for the shuttle in the manner of a sley. The operator sits in the fashion of a tailor, and, raising the sley with one hand, with the other passes the shuttle, which is simply a pointed stick with the thread wound upon it, between the threads of the warp. The work is beaten up after the passage of each thread by the use of a sharp smooth-edged instrument made of hard wood. The operation of course progresses slowly; and from the length of time consumed in spinning and weaving, they set a high price upon their blankets, asking for them ten or twelve dollars in money, or a new woollen blanket of equal size. The weaving is generally done by the old men.

The head-band or girdle consists of a white ground with a variety of figures of red, blue, and buff. The figures are angular, and, though they present a great variety, are all of one general character. The colored portions of these belts are made of wool, and the colors are quite brilliant. On examining the patterns on these bands, one is struck with their general resemblance to the figures on the ancient pottery found among the ruins of this country, a comparison with which will be made hereafter.

The pottery made by these tribes is all red or dark brown, the latter a blending of black and red. The articles made are very limited, though, perhaps, quite sufficient for their wants. In fact, they are the same as those made and in use by the Mexicans. They consist of ollas, or vases, of every size, the largest holding

about two pailfulls, and the smallest half a pint; jars with small apertures, resembling bottles; basins of different sizes and forms, from that of a milk-pan to a saucer; and oblong vessels of small dimensions used as dippers. All these vessels are painted or ornamented with black lines arranged in geometrical figures, and of a character resembling those on the head-bands.

Baskets and Pottery of the Pimos and Coco-Maricopas.

The basket work of this people is remarkably well made of willow twigs, and so close as to be impervious to water. The baskets are of various shapes, and are used for different purposes. Those of a large basin-like form are the most common. These they carry on their heads filled with corn or other articles. Like

the pottery, they are ornamented with geometrical figures, arranged with much taste.

The dress of the Coco-Maricopas and the Pimos is the same. The women fold the smaller blankets or other cloths, and pass them around their loins, letting them hang to their knees. They are sometimes fastened with one of the belts before mentioned, but are generally kept in place by simply tucking one end in. Sandals of raw hide are worn on the feet. Nothing is worn on the head, nor is the hair ever tied up.

Skin Pouch.

In front it is cut off square across the eyebrows; the rest is suffered to hang loosely over the ears, neck, and about half way down the back, affording a protection to these parts from the intense heat of the sun. It is a universal custom among the women when they arrive at maturity, to draw two lines with some blue-colored dye from each corner of the mouth to the chin. This is pricked in with some pointed instrument, and remains through life. Occasionally a fair one gets a

string of beads; but I saw more men and boys with these ornaments than women. One boy in particular, who might pass for a dandy among them, wore some twenty or more strings of beads. The body, arms, and legs of the women are naked. They generally have fine forms; for which they are indebted, as I have before remarked, to their mode of carrying burdens on their heads. In this respect, there is a marked difference between them and the men, who are generally lean and lank, with very small limbs and narrow chests. Their labor is so light, and they keep so closely to their villages or the immediate vicinity, that there is no opportunity for physical development. The men in general go naked, except the breech-cloth. A few, however, are provided with their native blankets of large size, which they fold and throw over their shoulders in the manner of the Mexicans. Some fasten them around their waists in graceful folds, letting the ends fall to their knees; then drawing a cord between their legs and attaching it to their waists, their garment resembles a capacious pair of pantaloons. I suppose that all are provided with cotton blankets; but, owing to the almost incessant heat of the day, they seldom wear them. At night, when cool, these constitute their sole covering. The head-band is worn by nearly all the men gracefully put on in several folds, with the braided ends hanging down to their shoulders. They also have a large woollen cord, from half an inch to an inch in diameter, of different colors, which they use as a head ornament, twining it around the hair. So many Americans have been among these people, that most of them have obtained ragged or

cast-off shirts, which they put on on great occasions. By their traffic with the Boundary Commission, they obtained a large number of these garments of a good substantial quality both cotton and woollen. The bright scarlet shirts gave them quite a picturesque appearance. When they visited our camp, every man put on his best garments, no matter what was their fashion, or how many he had. I remember that on one occasion Francisco made his appearance in a pair of pantaloons, with a white shirt, over which was a checked one, and another of red flannel outside of that. For a short time he strutted about the camp, the envy and admiration of his friends. But he soon got tired of sporting such a dress with the heat at 110° ; and shortly after we saw him cooling off on the grass, divested of all his finery, which he had carefully tied up in a bundle.

The men wear their hair long, never cutting it except across the eyebrows, down to which it hangs, and thus partially protects the eyes. When loosed, their hair reaches to their knees; but usually it is clubbed up in a large mass on their backs. Their earlocks either hang loose, or are braided in several strands, with little ornaments of bone, tin, or red cloth attached to them. But the decoration of their heads with the bands of which I have spoken, forms the most picturesque part of their costume. They have a singular practice of filling their hair with clay; so that when dry it resembles a great turban. I could not imagine their object in adopting so filthy a custom, unless it was to destroy the vermin. The men also wear a profusion of beads when they can obtain them.

Some have long strings of sea-shells or parts of shells, which are highly prized. I tried to buy some of them; but the only man at all disposed to sell asked me five dollars or a pair of blankets for a few strings, a price so extravagant that I declined to make the purchase.

The women carry their infants in cradles similar to those of other Indians. I have seen them in camp with a basket of green corn on their heads, and on the top of this the cradle and child. When it gets to be about a year old, it is carried astride on the hip, the mother holding one arm around its body. Although the men and boys go naked, I never saw a girl, however young, without clothes around its hips similar to those worn by the women.

The Indians were much amused by Dr. Webb's collection of insects, reptiles, and small mammalia, which were preserved in bottles or hanging about our tent. I told the boys to go out and collect for us any curious insects, lizards, or snakes they could find, and that I would reward them for so doing. Instead of letting the boys go, the men, in the belief that they would be well rewarded, went themselves, and in a few hours came very earnestly to my tent with a few grasshoppers and crickets. Although utterly valueless, as containing nothing new, yet Dr. Webb graciously received them, as an encouragement to prosecute their zoological researches further, at the same time informing his new recruits that lizards and horned frogs, which abound on the plateau, would be most acceptable. They now set off again, and we hoped something better from this second effort. About an hour after, some half-a-dozen sturdy fellows marched to-

wards my tent in single file, with a great deal of importance. The leader advanced with a dignified air, and the Doctor got his bottles ready to receive the specimens which the six men had collected. But his expectations, if he indulged any, of adding new species to his collection, soon vanished, when the man laid upon the table two small lizards, *minus their tails*, which had been broken off in securing them. For their arduous services in the cause of science, the captors of the tailless lizards coolly demanded a shirt apiece.

Two old chiefs made their appearance to-day, and at once recognised Mr. Leroux as the person who guided Colonel Cooke and his battalion through here in 1847. Mr. Leroux also recognised one whom they called Blanco, as a chief who commanded the Maricopas twenty-five years ago, when a party of hunters and trappers from New Mexico, among whom was Leroux, had a severe fight with them, and escaped narrowly with their lives. On being reminded of it, the old chief recollected the circumstances, which he related, and which corresponded with the account of Leroux.

The valley or bottom-land occupied by the Pimos and Coco-Maricopas extends about fifteen miles along the south side of the Gila, and is from two to four miles in width, nearly the whole being occupied by their villages and cultivated fields. The Pimos occupy the eastern portion. There is no dividing line between them, nor any thing to distinguish the villages of one from the other. The whole of this plain is intersected by irrigating canals from the Gila, by which they are enabled to control the waters, and raise the

most luxuriant crops. At the western end of the valley is a rich tract of grass, where we had our encampment. This is a mile or more from the nearest village of the Coco-Maricopas. On the northern side of the river there is less bottom-land, and the irrigation is more difficult. There are a few cultivated spots here; but it is too much exposed to the attacks of their enemies for either tribe to reside upon it.

The villages consist of groups of from twenty to fifty habitations, surrounded by gardens and cultivated fields, intersected in every direction by acequias, which lead the water from the Gila. Their mode of irrigation is the same as that practised in various parts of Mexico. Their cultivated fields are generally fenced with crooked stakes, wattled with brush, the thorny mezquit predominating; although I noticed large patches of wheat, a long distance from any village, that were not inclosed.

Their houses are built with stakes, poles, corn-shucks, and straw. For the small houses, four upright stakes forked at one end are inserted in the ground. For the larger dwellings nine are used; three on each side, and one in the centre. Across the tops of these, other sticks are laid to support the roof. Next a row of poles is inserted in the ground, a few feet outside the larger upright stakes, bent over towards the centre and fastened to the horizontal beams. These are then united in the centre, forming a slightly rounded top. Smaller poles are now horizontally interlaced with the upright ones, and between them straw, corn-shucks, or rushes are interwoven in large masses, so as to shed the rain and protect them from the intense heat of the

sun; some are then plastered over with mud. An opening for a door is left, about three feet high, to creep in at. These habitations vary in height from five to seven feet; so that in many of them one cannot stand erect. In fact they are chiefly used to sit and sleep in. In diameter they are from fifteen to twenty-five feet. In the most westerly village of the Coco-Maricopas, from which the annexed sketch was taken, the wigwams are wholly plastered with mud. Their cooking is done out of doors, where the greater portion of their time is passed, beneath a kind of shed or bower attached to the wigwams. This is open on all sides, and merely protected from the sun overhead. Beneath these bowers the people are generally seen engaged in their household occupations, only resorting to their better protected abodes in cool or rainy weather. The accompanying sketch shows the manner of erecting these wigwams.

Mode of constructing Wigwams.

Besides the dwelling-places, each family is provided with a store-house or granary. These are built like the Mexican *jakals*, i. e., with stakes placed close together and about eight or nine feet high. They are better structures than the dwellings, and are probably made more open, in order to give a free circulation of

air through the grain deposited in them. They are wattled with straw and rushes, and are sometimes coated with a thick layer of mud. As this becomes dry, additional layers of mud are added, which render

Coco-Maricopa Village.

them impervious to water. The wheat and shelled corn (maize) are put into large vases or baskets, from three to five feet high, made out of ropes of wheaten straw. These ropes, which are as thick as one's arm, are coiled around into graceful forms, and sewed together like some kinds of basket work. The vases

so formed contain ten or twelve, and some even fifteen bushels of grain. The following sketch exhibits a view of the interior of a Pimo granary or store-house:

Pimo store-house.

On the tops of their wigwams and granaries may often be seen large piles of mezquit beans in the pod, which are placed there to dry, preparatory to being ground into flour for pinole.

Both the tribes of Indians referred to, use a singular piece of frame-work made of three poles connected with a netting, which is carried on their backs. These are used both by women and men for gathering mezquit beans, corn, and other light articles. They may be seen at every wigwam, and answer the purpose of a wheelbarrow. They are highly prized by their owners, as they are very useful to them, and are made with much labor. For the only specimen I could obtain, I was obliged to give goods to the value of ten dollars.

These people possess horses and cattle, though but

very few mules. I found it impossible to procure a single mule from them during my stay. They breed none, and what they obtain are such as have been lost or abandoned by passing emigrants. They plough but little, finding their hoes quite sufficient for turning up the light soil. When ploughing is resorted to, oxen alone are used. They possess a few carts and wagons, obtained from emigrants, which they use with oxen for agricultural purposes. We saw all kinds of saddles among them, from the best dragoon and Mexican saddles to the simple tree or frame. They find them on the road, where they have been thrown away by parties who have lost their animals. Those who ride bareback use a broad girth, which is passed quite loosely around the body of the horse. Into this one foot is inserted. There seemed to be numbers of horses among them, which with the cattle are left to graze near the villages during the day, and at night are brought into the corrals, or yards, for safety.

The only weapon used by these tribes is the bow and arrow. The short club of the Yumas and the long lance of the Apaches I never saw among them. The constant use of this weapon has rendered them excellent marksmen. Even the boys are very expert in the use of it. I have seen boys of ten or twelve years of age, strike a cent three times out of five at a distance of fifteen yards. It is quite common for them to shoot doves with their arrows, and to bring in half a dozen of these birds after a ramble among the cotton-woods. It is a favorite amusement with both men and boys to try their skill at hitting the petahaya, which presents a fine object on the plain. Numbers

INDIAN AMUSEMENTS. SHOOTING AT THE PETALAYA.

CHAPTER XXXI.

AT THE COCO-MARICOPA AND PIMO VILLAGES.

Journey to the River Salinas—Its rich bottom-lands—Large stream—Pimo Indians—Ruined buildings—Mounds—Broken pottery—Traces of irrigating canals—Ancient population probably large—Return towards the Pimo villages—Are taken for Apaches—Arrival at camp—Arrival of Lieutenant Whipple—Survey of the Gila completed—Trade reopened with the Coco-Maricopas—Presents—Tribe of Cawenas—Remove to the Pimo villages—Cola Azul and the Pimos—Traffic with them—Conference—Giving presents—Arrival of Mexican traders—Return of Lieutenant Paige with the escort—Leave the villages.

July 3d. In order to make the most of my time while waiting the arrival of Lieutenant Whipple and party, I determined to take a short trip up the river Salinas, as far as the "Casas Grandes," or ancient remains said to be there. I asked a couple of Maricopas to go with me as guides, and offered them a red flannel shirt each for their services. They wished two others to accompany them, if I would take them on the same terms. Finding that I consented so readily, they parleyed a while, and then demanded for each a shirt, six yards of cotton, and sundry small articles, without which they declared they would not go. Francisco, the interpreter, was their spokesman, and I have no doubt urged them to make this demand. I

refused to accede to it, and told them that Francisco and one other would answer my purpose, as first proposed.

At six o'clock this morning we set off, the party consisting of Dr. Webb, Messrs. Thurber, Pratt, Seaton, Force, Leroux, and myself, with attendants. Lieutenant Paige, with six soldiers, also accompanied us, that officer wishing to examine the opposite bank of the Gila, as well as the lands contiguous to the Salinas, with a view of establishing a military post in the vicinity of the Pimo villages. After crossing the bed of the Gila we pursued a westerly course about eight miles to the point of a range of mountains, near which we struck the bottom-lands. We now inclined more to the north, and in about eight miles struck the Salinas, about twelve miles from its mouth, where we stopped to let the animals rest and feed. The bottom, which we crossed diagonally, is from three to four miles wide. The river we found to be from eighty to one hundred and twenty feet wide, from two to three feet deep, and both rapid and clear. In these respects it is totally different from the Gila, which, for the two hundred miles we had traversed its banks, was sluggish and muddy, a character which I think it assumes after passing the mountainous region and entering one with alluvial banks. The water is perfectly sweet, and neither brackish nor salt, as would be inferred from the name. We saw from the banks many fish in its clear waters, and caught several of the same species as those taken in the Gila. The margin of the river on both sides, for a width of three hundred feet, consists of sand and gravel, brought down by freshets when

the stream overflows its banks; and from the appearance of the drift-wood lodged in the trees and bushes, it must at times be much swollen, and run with great rapidity. The second terrace or bottom-land, varies from one to four miles in width, and is exceedingly rich. As it is but little elevated above the river, it could be irrigated with ease. At present it is covered with shrubs and mezquit trees, while along the immediate margin of the stream large cotton-wood trees grow. Near by we saw the remains of several Indian wigwams, some of which seemed to have been but recently occupied. Francisco told us they were used by his people and the Pimos when they came here to fish. He also told us that two years before, when the cholera appeared among them, they abandoned their dwellings on the Gila and came here to escape the pestilence.

Owing to the intense heat, we lay by until five o'clock, and again pursued our journey up the river until dark, when, finding a little patch of poor grass, we thought best to stop for the night. Supper was got, and a good meal made from our fish. As we brought no tents, we prepared our beds on the sand.

We had not long been in when we saw a body of twelve or fifteen Indians on the river making for our camp. At first some alarm was felt, until Francisco told us that they were Pimos. They proved to be a party which had been engaged in hunting and fishing. They were a jolly set of young men, dancing and singing while they remained with us. I told them we would like a few fish for breakfast, if they would bring them in. With this encouragement, they took leave

of us, promising to fetch us some in the morning. But instead of waiting till the morning, they returned to the camp about midnight, aroused the whole party with their noise, and wished to strike a bargain at once for their fish, a pile of which, certainly enough to last a week, they had brought us. There was no getting rid of them without making a purchase, which I accordingly did, when they left, and permitted us to get a few hours' more sleep.

July 4th, 1852. Left camp at half-past four, A. M., determined not to wait for breakfast, but make the most of our time while it was cool; for it would be impossible to travel, or rather be attended with great inconvenience, during the heat of the day. We continued our course due east up the river, towards some singular piles of rocks with fantastic tops, appearing like works of art. For some time we all imagined these rocks to be the ruined buildings of which we were in search—the “houses of Montezuma,” as our Indian friends called them. We passed over the edge of a mountain, at the base of which the river ran, and then came to a wide and open plain, stretching some twenty-five or thirty miles eastwardly and southwardly. Entering this, we attempted to cross the bottom, which was so thickly overgrown with weeds and bushes that we could not penetrate it. We tried in vain to get through, but finding ourselves scattered, and fearing we should lose sight of each other, we retraced our steps along the margin of the hill, until we passed the jungle. The bottom now became more open, and five or six miles further brought us to the plateau. On our way we saw many traces of ancient

irrigating canals, which were the first evidences that the country had been settled and cultivated. But on reaching the plateau we found remains of buildings, all, however, in shapeless heaps. Not an erect wall could be seen. A little mound, conical or oblong, designated the character of the building. In many places I traced long lines of fallen walls, and in others depressions, from which the soil had been removed to make the adobe. On the plain, in every direction, we found an immense quantity of broken pottery, metate stones for grinding corn, and an occasional stone axe or hoe. The ground was strewn with broken pottery for miles. It was generally painted in a variety of geometric figures. The predominant colors were red, black, and white. The quality of the ware was very fine, more so than that made by the Pimos. I noticed too that much of it was painted on the inside, while at the present time all the pottery of the Indians and Mexicans is painted on the outside.

As it was now growing very warm, we left the plateau and struck off for the Salinas, encamping beneath some tall cotton-woods, where we prepared and partook of a late breakfast.

Mr. Leroux, who had before come down the Salinas, pointed out to me a mountain some six or eight miles off, at the base of which the river San Francisco or Verde enters from the north. Since we struck the Salinas, its course had been mostly east and west; and as far as it could be traced by the cotton-woods and verdure which mark its course, its direction indicated the same. We supposed ourselves now to be from thirty-five to forty miles from its mouth. Look-

ing east from where we were, the whole prospect was shut in by mountains rising one above the other. I was informed by Leroux, that such was the character of the country all the way to New Mexico; and that there were no more broad desert plains or luxuriant valleys like those of the Salinas and Gila rivers for the entire distance. He came here from Albuquerque, on the Rio Grande, by the valley of the Rio Verde, in fourteen days.

We found the river clear and rapid, as at the first camp, with many trout, whose silvery sides glittered in the translucent stream. The quantity of water passing down the Salinas is more than double that of the Gila, which only becomes a respectable river after it receives the waters of the former. Yet there are seasons when the whole is evaporated, or absorbed by the sandy bed through which it passes, before reaching the Colorado. When at Hermosillo, in Sonora, I met an American who had passed over the same route, and he found the bed dry in many places.

At five in the afternoon, the heat being less, I crept from beneath my shelter of willows, where I had spent several hours, and, accompanied by Dr. Webb, mounted my mule, and left for the plateau in advance of the party. A ride of a mile brought us to the tableland, when we made for a large mound or heap which arose from the plain. In crossing the bottom we passed many irrigating canals; and along the base of the plateau was one from twenty to twenty-five feet wide, and from four to five feet deep, formed by cutting down the bank—a very easy mode of construction, and which produced a canal much more substan-

tial than if carried across the bottom. It must have extended many miles. The whole of this broad valley appeared to have been cultivated, though now overgrown with mezquit shrubbery.

On reaching the great pile, I found it to be the remains of an adobe edifice from two hundred to two hundred and twenty-five feet in length, by from sixty to eighty feet wide, its sides facing the cardinal points. Portions of the wall were visible only in two places, one near the summit, at the south end, where, from the height of the pile, it must have originally been three or four stories high; and the other at the northern extremity, on the western side. These remains just projected above the mass of rubbish and crumbled walls. The rest formed rounded heaps of various heights and dimensions, worn into deep gullies by the rain; the whole presenting a striking resemblance to the mounds which mark the site of ancient Babylon.

The higher walls seen in the sketch, probably belonged to an inner portion of the building. Near this is a conical hill, formed, doubtless, by the crumbling away of the higher portion or tower. Near the wall, which projects from the lower portion, at the northern end, are some large masses of this wall which have fallen. The adobe is still very hard, so much so that I could not break it with the heel of my boot. Several broken metates, or corn-grinders, lie about the pile. I picked up a stone pestle and some small sea shells. Along the eastern side are the remains of a long wall, extending beyond the building, now but a rounded heap, which seemed to have formed an inclosure. On the western side is an exca-

vation about four feet deep, and extending from sixty to eighty feet from the main heap, and along its entire length; from which I suppose the mud and gravel to have been taken to make the adobe. To the northeast, at a distance of two or three hundred feet, are the ruins of a circular inclosure. This was not large enough for a corral; nor could it have been a well, as

Ruins on the Salinas.

it is too near the margin of the plateau where the canal ran, which would always furnish a supply of water. At the south, two hundred yards distant, are the remains of a small building with a portion of the wall still standing.

From the summit of the principal heap, which is elevated from twenty to twenty-five feet above the

plain, there may be seen in all directions similar heaps ; and about a mile to the east, I noticed a long range of them running north and south, which the Indians said were of a similar character to that on which we stood. In every direction, the plain was strewn with broken pottery, of which I gathered up some specimens to show the quality, as well as the style, of ornamentation. I also found several of the green stones resembling amethysts which the Indians, after heavy rains, come here in search of. They are highly prized by them. All the early travellers in this country, from Coronado, who crossed the Gila in 1540, to the present time, have spoken of these so called amethysts. I would have liked to make a further examination of this plain ; but our animals had no grass or other feed, nor should we find any until we could reach the Gila, twenty-five miles distant, which prevented me from extending my examinations.

Mr. Leroux informed me that on the banks of the San Francisco, are similar heaps to these, and other ruins, the walls still standing. He thinks that the buildings he has seen on that river, and others in the Moqui and Navajo country, of three and four stories in height, would, if in a ruined state, make similar heaps to those under our notice. I am inclined to the same opinion, and believe that the ruins we visited, belonged to a building of several stories.

There is no doubt that this valley, as well as that of the Verde and Gila Rivers, were once filled with a dense population, far enough advanced in civilization to build houses of several stories in height, surrounded with regular outworks, and to irrigate their lands by

canals extending miles in length; but they seem to have left no trace or tradition by which we can tell who they were, or what was their fate. I made frequent inquiries of the Pimos and Coco-Maricopas as to the builders of these and the ruins on the Gila, but could obtain no other than the ever-ready, *Quien sabe?* These, as well as the ruins above the Pimo villages are known among the Indians as the "houses of Montezuma," an idea doubtless derived from the Mexicans, rather than from any tradition of their own. We asked our Indian guide, who Montezuma was. He answered, "Nobody knows who the devil he was; all we know is, that he built these houses."

After spending an hour here, we took a strongly marked trail, which looked as though it had been travelled for a century, and which led due south towards the Pimo villages. There were other trails, leading in various directions; showing that the plain is much traversed, and the ruins often visited. We journeyed rapidly over the plain, which was a portion of the great plateau or desert. It was a perfect level without an undulation. Not a hill or a ravine intercepted our path. The vegetation was the same as found on the plateau in our journey up the south side of the Gila. Larrea and small mezquit bushes predominated; while now and then the graceful *petahaya* raised its tall head far above the dwarfish plants of the desert, often startling us with its sudden appearance. It was near midnight when we entered a thick grove of mezquit, from whose branches were pendent large quantities of the beans of which the mules are so fond. As we had now travelled from twenty-three to twenty-

CULTIVATED FIELDS AND VILLAGES OF THE PIMO INDIANS.—p. 14. vol. ii.

five miles from the Salinas, and did not know the distance to the river, we concluded to stop here. We accordingly hitched our mules by their long lariats to these bushes, on which they could feed, and stretched ourselves beneath their wide-spreading branches, to get a little rest until daylight should again appear.

July 5th. At half-past four, without waiting for breakfast (for the reason that we had none to cook), we resumed our journey, and in two miles reached the Gila, or rather its bed; for it was dry here. As we entered the first fields of the Pimos, the sentinels in the outskirts, seeing us approach in long single file, mistook us for Apaches and gave the alarm accordingly; a very natural mistake, as no party of emigrants or travellers had ever entered their country from the north. We heard the alarm given, and echoed in all voices, from one tree or house-top to the other, until it reached their villages. "Apaches! Apaches!" was the cry from every mouth; and when it reached the first village, it was borne onward to every part of the community, even to their allies the Maricopas. The two Indian guides who were with us, discovered the stampede we had so unintentionally caused among their Pimo brethren, and seemed to enjoy the joke much. In a few minutes we saw the Pimos mounted, bounding towards us in every direction, armed and ready for the contest; others, on foot with their bows and arrows, came streaming after them; and in a short time, the foremost horseman, who was doubtless striving to take the first Apache scalp and bear it as a trophy to his people, reigned his steed before us. As he and those about him, perceived

their mistake, they all burst into a hearty laugh, which was joined in by the rest as they came up. Assembling around our two Maricopas, they learnt the particulars of our visit to the Salinas. They then all wheeled around; and while a portion acted as our escort to their villages, others fell behind and brought up the rear, so that our entry was that of a grand cavalcade. At 8 o'clock, we reached our place of encampment, having travelled fourteen miles.

In the afternoon, Lieutenant Whipple and his party arrived. They had completed the survey of the Gila, a labor at this season of the year, with the heat at from 100 to 120 degrees Fahrenheit, attended with no small difficulty.

June 6th. As the notes of this survey, and the accompanying astronomical observations, had been obtained with great labor and some suffering. I felt unwilling to expose them to the risk of being lost in a journey across the continent; and, accordingly, determined to remain here a few days longer, to give Lieutenant Whipple an opportunity to duplicate them with the view of sending them back by a messenger to Major Heintzelman, at Fort Yuma, to be forwarded by him to the Secretary of the Interior at Washington.

A brisk trade was carried on to-day with the Cocomaricopas for corn, beans, meal, pinole, and squashes, as well as for the various articles of their manufacture, such as pottery, cotton blankets, baskets, &c. I gave the trading department into Mr. Thurber's hands, finding it would be better managed by one person. He fitted up his tent for the purpose and made such a dis-

play of goods as was never beheld before in this community. I also told Francisco, the chief before mentioned, to invite all the chiefs or captains as he called them, of his tribe to come in, and I would make each of them a present of such articles as I had to give. Five, accordingly, presented themselves, and to each of them I gave shirts, a few yards of cotton cloth, some vermilion, beads, trinkets, etc.; with all which they seemed greatly pleased. I told them that these things were in return for the friendship shown, and the assistance they had given to the poor American emigrants who had passed through their country, and that they must continue to aid them when in their power to do so. I added that they would then be considered as the true friends of the Americans, and would be rewarded accordingly; furthermore, that the Americans might be induced to establish a garrison near them, which would protect them and prevent all future attacks from the Apaches.

It was on this occasion, that I gave Francisco so many things, for which he seemed so ungrateful. I found too, that he had told his people to advance the price of their corn, and other things; which made this day's bartering the end of our trade. I felt quite indifferent on the subject, as it was my intention to remove the camp to the villages of the Pimos; for Mr. Leroux had ascertained that they were much better supplied with corn and every other commodity than the Cocomaricopas, and were very desirous that we should divide our time with them for the purpose of trading.

A few Indians of a nearly extinct tribe called the *Cawinas*, were in camp to-day. Only ten of this tribe

remain, who are living among the Pimos and Coco-Maricopas. Their former dwelling-place was on the Gila towards the Colorado. There they were brought in contact with the Yumas; and in the constant wars that existed between them and the Cawinas, they were all exterminated, except the small number which had taken refuge here. They speak a language different from the Pimos and Maricopas, and I could find but one man among the latter who understood it. He promised to come and give me the vocabulary, but did not again make his appearance.

July 8th. After breakfast this morning, we struck our tents, and bade farewell to our Maricopa friends, among whom we had been ten days, with many regrets. From the first day of our arrival, they had thronged our camp both day and night; and I am not aware that they ever took an article that did not belong to them, nor had there been any difficulty between us, except their trying to overreach us in trade. But this did not interrupt our friendship, or prevent me from treating them all with kindness. In their intercourse with the whites, they are a docile and inoffensive people; but they exhibit the same cruelty as other Indians, towards those of their red brethren with whom they are at war. They still have occasional fights with the Yumas and the Apaches; and should any prisoner fall into their hands, they would delight, as much as the Apaches do, in putting him to the torture.

Last winter, while Dr. Webb and his party were here, they saw an example of this. It appears that when Captain Ximenes, with the Mexican Commission, was at the Colorado, they induced an intelligent Yuma

to return with them. On passing through the villages of the Coco-Maricopas, notwithstanding every effort of the Captain to conceal this man, they discovered him, and by stratagem, got possession of him. The party endeavored to effect his release; but they had not force enough to compel his captors to surrender him, and no presents would induce them to do so. He was put to the torture; and Dr. Webb and the other gentlemen of the U. S. Commission, were invited to join the Maricopas, in the festivities and dances on the occasion.

Group of Pimo Indians.

As we rode through the villages, we saw the peo-

ple engaged in their various occupations. The women were generally at work grinding their corn or wheat. The children were squatting or lying in the shade, doing nothing. The cradle was suspended by a cord to the roof and kept swinging by the husband, who lay stretched at length on his back, or by the children. In these communities, there are men who labor in the fields, while others lounge about the villages doing nothing. They seem to have their dandies and gentlemen of leisure, as well as their more civilized brethren. The women, too, were carrying water on their heads, or transporting other things in the sprawling frames upon their backs.

At noon, having journeyed about twelve miles through these villages and cultivated fields, we reached a spot near an acequia, where there was grass, and a pleasant grove of mezquit trees. Here we pitched our tents, intending to remain a few days.

We had scarcely got our camp in order, when we were surrounded by the Pimos. I sent a messenger to inform their head chief *Cola Azul* (blue tail) who was at work in the fields, that I would be glad to see him. In a short time he appeared, accompanied by his interpreter *Tu-maams*. Although it was a dreadfully hot day, when we felt like divesting ourselves of as much clothing as possible, Cola Azul appeared in a large blue blanket overcoat, pantaloons, and a green felt hat, while his attendants were either naked, or wore around their loins the white cotton blanket of their own manufacture. He at once presented me a number of credentials from various American officers, and others, who had passed here, and held intercourse with him

DEFILE IN THE GUADALUPE PASS, SIERRA MADRE, SONORA —p. 254. vol. II.

FRAGMENTS OF ANCIENT POTTERY FROM THE GILA AND SALINAS.—p. 255.

and his tribe—setting forth that he was the head chief, that his people were friendly to the Americans, and requesting all should respect them and treat them kindly. The earliest of these, was from Colonel St. George Cooke. This chief was about 50 years of age, with a fine, amiable expression of countenance, and a quiet and dignified manner. He was greatly beloved by his people, who showed him more deference than I had ever seen extended by Indians to their superiors.

I told this chief who we were, and the object of our visit. He readily comprehended my meaning, and referred to the surveying parties under Mr. Gray and Lieutenant Whipple, which had been operating here during the winter. I told him that, having completed the work, we were now on our return to the United States; and that having heard of his kind treatment of the Americans who had passed through the villages of his people on their way to California, I wished to see all the chiefs of his tribe and present to them a few articles, as a token of the respect which the American government entertained for them. I added, that I would be ready to receive them the following morning.

July 9th. The day had scarcely dawned when I was awoke by a chattering of strange voices around my tent; on putting out my head, I found to my surprise, that, although it was but 4 o'clock, the Pimo chiefs were already on the spot. This was a little too early for business, and besides, I was not prepared for the proposed conference. It would have been impolite to send them back; so I requested them to wait until I had taken my breakfast, which would be in about three

hours. They seemed well content with the delay, and the opportunity it gave them to stroll around the camp, and inspect the several culinary processes, from that of the Mexican arrieros with their queer dishes, to the cuisine of the officers, where, if there was no great variety of food, there was to them a curious display of iron, tin, and copper cooking utensils, with some articles for the table that attracted their attention.

At eight o'clock, I was ready to receive the deputation of the Pimo chiefs. The largest tent in the commission had been pitched for the purpose. The ends and sides were opened and rolled up, and trunks placed for the chiefs to sit upon. There were altogether six chiefs, including Cola Azul, besides two interpreters. The latter were absolutely necessary, as there were no Pimos who spoke Spanish. Tumaams, the elder of the interpreters, was born of Pimo and Maricopa parents, and spoke both languages. He therefore repeated what the Pimo chiefs said, to a Maricopa, named *Mis-ke-tai-ish*, who spoke Spanish; and I communicated with him. This was a roundabout way of talking; but there was no alternative. At the opposite end of the tent were the officers of the Commission. On the outside were congregated crowds of Indians, both Pimos and Coco-Maricopas; for the latter had followed us, and were nearly as numerous as when we were among them. It was quite an animated scene; the women, with their children, equalled the men in number, having come to do a little shopping after the business with the chiefs had been dispatched.

I stated to them as briefly as possible, that the Americans had heard from General Kearney, Colonel

Cooke, and others, who had passed through their country on their way to California, of the friendly disposition the Pimos had manifested towards them. That the surveying parties belonging to the Boundary Commission, had also spoken favorably of them. That I was not an Indian Agent, such as the United States often sent to make treaties with the tribes, and to distribute presents; but was in command of a party from the American government to trace the Boundary line which separated the United States from Mexico. That having been to California, and completed this duty, I was then on my return to the United States, and should remain a few days with them, to give my animals rest, as well as to procure corn for them, and vegetables for my party. That I also wished to purchase of them, specimens of the various articles which they made, such as their blankets, baskets, pottery, bows and arrows, &c., to show to the American people, that they might see what they could do; and that, for these I would give them in exchange, blankets, cotton shirts, and other articles. Furthermore, I told them, as an evidence of my good feelings towards them, and in consideration of the kind treatment they had extended to the Americans, I would present to each of them and to the interpreters, some shirts and cotton cloth. To these I added, for Cola Azul, blankets, calico, beads, and trinkets for his wife and children. Before separating, I requested them to exert themselves in endeavoring to obtain the liberation of the two American girls (Mr. Oatman's daughters) who had been carried into captivity by the Apaches, or other Indians, not known to me.

They were much pleased with these trifling presents, reiterated their expressions of friendly feelings towards the Americans, and said they would do all in their power to recover the two girls. They believed the Tonto Apaches to have been the murderers of their parents. I told them of the intention of the government to establish a military post near them on the Gila, which would protect them from further attacks of the Apaches. This pleased them much.

After the conference was ended, trading commenced with much briskness. The same articles were bought of them as from the Maricopas, and we were enabled, without difficulty, to obtain all the corn that was necessary for the mules of the whole train. One of their baskets we agreed upon with them for a measure, a certain number of which was the value of a yard of white cotton or a particular kind of shirt. This was quite satisfactory to them; and a much larger quantity of corn was brought in than we were able to take. When we had nearly completed our purchases, Francisco, the Maricopa chief and interpreter, came in and again interfered; but the Pimos did not regard him, and manifested much pleasure when I ordered him out of the camp. They did not like his officiousness, and said he always thrust himself forward whenever a party of Americans or Mexicans came along, and managed to get whatever they had to give away or barter, much to their disadvantage.

July 10th. Three Mexican traders arrived this morning from Tucson, opened their goods at one of the villages, and for a while drew most of the Indians from us. Towards evening they returned, and for the

few things we wanted, they now asked more than double their former prices. Green corn, which we had bought for one dollar a hundred, in the ear, they now asked four dollars for, and other things in proportion. We had, however, procured every thing we required, except mules, which we were much in want of. These they had promised to bring us, but had failed to do so.

Lieutenant Whipple joined us to-day, having completed his notes and plottings, and we are again encamped together.

July 12th. As the escort under Lieutenant Paige furnished me by Major Heintzelman at Fort Yuma, had accompanied us as far as was deemed necessary, that officer made arrangements to set out on his return to the Colorado this morning, with his command. I availed myself of the opportunity to communicate with the government, and advise it of the successful completion of the Survey of the river Gila.

We were now to leave the Gila and strike across a desert of ninety miles, where there is said to be neither grass nor water, before we should reach *Tucson*, the extreme outpost of the Mexicans. I deemed it advisable, therefore, to move our camp to the farthest point on the Gila, before attempting to cross this jornada. The Mexican traders who arrived yesterday said they had found no water the entire distance; and unless it should rain, of which there was some prospect, (although we had seen none for two months) our animals would undergo great hardships in crossing it. We accordingly set out after breakfast this morning, passing through the last of the Pimo villages and their

cultivated fields; and, after following the road for twelve miles, turned short off to the north, and encamped for the last time on the banks of the Gila. The river was here much contracted, with steep banks fifteen feet high, and completely overhung with willows and cotton-woods, the latter from the opposite banks, meeting at the top. Its width was less than fifty feet, and its greatest depth did not exceed nine inches. It moved sluggishly along, was well charged with mud, and uncomfortably warm to bathe in. The bottom lands were three quarters of a mile in width on the south side, where we encamped, with a rich soil, and filled with mezquit trees.

But few Indians came in to-day, as we were between six and eight miles above their most easterly village. Those who ventured to follow us, said that it was unsafe to go so far from home unless in large numbers, as bands of the Apaches were constantly hanging about near their villages, watching every opportunity to send an arrow through them, or rob them of their animals. It was so exceedingly hot to-day, that after reaching camp, we lay under the deep shade of the willows, on the river's bank, without pitching our tents.

CHAPTER XXXII.

INDIANS OF THE GILA, AND THE CASAS GRANDES.

History of the Coco-Maricopas and Pimos—Origin of their semi-civilization—Difference of languages—Their number—Physical peculiarities—Deserving the attention of Christians and philanthropists—Early accounts of these Indians—First described by Father Kino in 1697—Sedelmayer's visit to them in 1744—Father Font's in 1775—Visit to the Casas Grandes of the Gila—Description of these ruins—Evidences of a former large population—Irrigating canals—Broken pottery—Father Font's description of their buildings—Singular error in relation to their dimensions—Kino and Mangi's visit to them in 1694—Notion of the Aztec origin of these buildings not well founded—Excessive heat.

HAVING now left these peaceable semi-civilized Indians, a few general remarks respecting them seem to be required.

Some writers have endeavored to point out physical differences between the Pimos and their allies the Coco-Maricopas; but I must confess, that after being constantly with them for thirteen days, I was unable to distinguish one from the other, except by some slight difference in the method of wearing their hair. Their modes of life, as before remarked, are the same, with the exception of their funeral rites. In the valley, or rather bottom-land, which they occupy, there is no

dividing line between them ; nor is there any distinguishing character in their villages. I consider that the arts of spinning and weaving, and of making pottery, now practised by both tribes, and in which they are equally expert, originated with the Pimos, who inherited this knowledge from their ancestors ; and that from the earliest period, doubtless for centuries, they have occupied portions of the same valley where we now find them. In leaving their villages, I noticed on the edge of the plateau traces of former habitations, which had been abandoned for a great length of time.

The Coco-Maricopas took up their abode in the valley immediately adjoining the Pimos about thirty years since, from a point lower down the Gila, where they were exposed to the constant attacks of the Yumas and Apaches, which tribes, in consequence of their greater numbers, had nearly annihilated them. They came hither for protection, and formed an alliance, offensive and defensive, with the Pimos. They found the latter possessing the arts of weaving, of building more comfortable dwellings, of making better pottery, enjoying a more peaceful mode of life, than that to which they had been accustomed. These arts and habits the Maricopas gradually adopted. Their languages are totally different, so much so that I was enabled to distinguish them when spoken. The former is soft and melodious, the latter harsh and guttural. The Pimos bury their dead, while the Coco-Maricopas burn theirs. These peculiarities stamp them as distinct nations.

I have not cited the agriculture of these tribes as superior to that of all other Indians ; although I may

be safe in saying, that the system is more extensively and methodically practised than elsewhere. The Yumas, and other tribes on the Colorado irrigate their lands, and raise wheat, corn, melons, etc. The Moquis and the Navajos, far to the north, do the same; and the warlike Apaches, who are more nomadic in their habits than any tribe west of the Rocky Mountains, raise corn when driven to extremities. But the Pimos and Coco-Maricopas have made agriculture more of a system. Their lands are better irrigated, their crops are larger, and the flour which they make from their wheat and maize is quite as good as the Mexicans make, except in their grist-mills.

I am inclined to think that Major Emory in his Report has greatly over-estimated the number of these people. He states, that "the population of the Pimos and Coco-Maricopas together is estimated variously at from three to ten thousand, and that "the first is evidently too low."* From information obtained from the chiefs, and the Mexican officers in Sonora, I should not place them above two thousand. Captain Johnston,† another officer attached to the army under General Kearney's command, in estimating them as embracing "over two thousand souls," came very near the mark. Of the number stated by me, I was told that two thirds were Pimos.

Their complexion is a dark brown, differing from that of the red-skins east of the Rocky Mountains, and from the olive cast of the California tribes. The women have good figures, with full chests and finely

* Emory's Report, p. 86. † Johnston's Report, p. 599.

formed limbs, owing, in a measure, to the burdens they carry on their heads. The men have small and slender limbs, and, in their physical development, are quite inferior to the tribes between the Mississippi and the Rocky Mountains. This is readily accounted for by their different modes of life. The Pimos exhibit a great simplicity of character, more so, I think, than the Maricopas, preferring to lead the quiet lives of agriculturists to the roving and predatory habits of the Apaches, Comanches, Navajos, and others. But although they do not like wars, they are by no means cowards, and do not hesitate to march against their enemies, the Apaches, when it becomes necessary. There are no tribes of Indians on the continent of North America more deserving of the attention of philanthropists than those of which I am speaking. None have ever been found further advanced in the arts and habits of civilized life. None exhibit a more peaceful disposition, or greater simplicity of character; and certainly none excel them in virtue and honesty. They are quite as industrious as their necessities require them to be. Possessing no market for the sale of their produce, they raise but little more than is necessary to supply their own wants. To do this, with a soil of great fertility, and water at their command, requires but little labor. Hence, after their crops are in, they have nothing to do until the season arrives to gather them. Their granaries are then filled with wheat, corn, beans, pumpkins, squashes, mezquit beans (their substitute for sugar), and the fruit of the petahaya; and after that, they undergo another long season of inactivity. Our Missionary Societies and Boards of

Education could not devote a portion of their means to a more worthy object, than to send teachers and mechanics among this interesting people before they become contaminated by intercourse with the whites, and the seeds of evil are sown, which, when ripened, will exert the same baneful influence upon them as they have upon all other aboriginal tribes, leading to their degradation and final extinction. They will be found willing pupils, having expressed a great desire to be taught to read, and to obtain a knowledge of the mechanic arts.

Among the Indians visited by Coronado and Marco de Niza, about the middle of the sixteenth century, in their extensive journeys through the regions between the Rio Grande and the Pacific, although it is certain that the former crossed the Gila, I am unable to discover any allusion to the Pimos, or to the district occupied by them. In the diary of an expedition made by the ensign Juan Mateo Mangi, who accompanied Father Kino, in the year 1697, after visiting the Casa Grande (of which I shall hereafter speak), he says: "On the margin of the river, distant one league from the Casa Grande, we found a town in which we counted one hundred and thirty souls."* The author continues: "Having traversed four leagues, we arrived at the town of Tusonimon, which is so named from a great heap of horns, from the wild or sylvan sheep, which appears like a hill; and from the number that

* I am indebted for this extract to Mr. Schoolcraft's valuable work on the Indian Tribes, vol. iii., p. 301. It is from a manuscript in the archives of the City of Mexico, from which it was copied by Buckingham Smith, Esq., Secretary of the United States Legation.

there are of the animals, they make the common subsistence of the inhabitants. From what can be seen of the highest of these houses, there appears to be a country of more than a hundred thousand hastas in extent.*

“The heathen Indians received us with jubilee, giving of their provisions to the soldiers; and we counted two hundred persons, who were gentle and affable. Remaining there to sleep, the Father and I instructed them, through the interpreters, in the mysteries of our Holy Faith; on which they besought us that there might be baptized fifteen of their children and seven sick adults.”

Four leagues from the Casa Grande would bring us about to the spot where we were then encamped, and near to the villages of the Pimos, which, in former times, extended much further up the Gila than they do at present. The great country which the writer saw here was doubtless the plain where the villages now stand, and the great plain to the north, extending twenty-five or thirty miles to the Salinas.

But Alegro,† in recounting the arduous labors of Father Kino, relates other particulars of the Pimos and Coco-Maricopas, and the interviews between them and this zealous missionary. Kino found, in 1698, the most friendly relations existing between them, and noticed the difference in their languages and dress. But their manners and customs were the same; and

* Measure of a lance, about three yards in length.

† Hist. de la Compañía de Jesus en Nueva España, tom. iii., pp. 83 and 103.

the worthy Father particularly noticed "their peacefulness and their gentleness." They were alike desirous to be baptized and instructed, a desire that Kino willingly gratified. He estimates their numbers at four thousand; but whether or not this includes both tribes, is not clear. They then irrigated their lands as now, and had large cultivated fields of wheat. The Cocomaricopas were then situated beyond the Pimos, probably on the Salinas and Gila, below the junction. Father Kino, in another expedition to the Gila, took with him two Pimo Indians from the mission at Ures to act as his interpreters, which enabled him to communicate freely with these tribes.

In an anonymous manuscript of a Jesuit, dated 1764, descriptive of Sonora,* where he lived many years as a missionary, the writer speaks of the Pimos, who were on the precise spot where we now find them inhabiting both margins of the Gila. "The towns of that people," he says, "which occupy ten leagues of the mild vale along it, with some islands, abound in wheat, maize, etc., and yield much cotton; to them also is referred the fabrication of the finest kinds of pottery, whose remains form one of the archæological indications of the Gila valley."

But the most circumstantial account of the Pimos is that of Father Pedro Font, who, with Father Garces, made, in 1775-'76, a journey from the Presidio of Orcasitas, in Sonora, to Monterey, in California, of

* Extract from a MS. entitled, "Descripción Geográfica Natural y Curiosa de la Provincia de Sonora. Por un Amigo del Servicio de Dios. Año de 1764," in Mr. Schoolcraft's *History, Condition, and Prospects of the Indian Tribes*, before referred to, vol. iii. p. 304.

which I have before spoken. They passed down the Gila, which river they struck about the place where we were now encamped. The towns were then called *Uturituc* and *Sutaguison*. I now quote from the journal of Father Font, a manuscript copy of which is in my possession :

November 1st. 1775. We left the laguna at half-past nine A. M., and at one P. M. arrived at Uturituc. The Indians (according to my calculation about one thousand) received us in two files, the men on one side, the women on the other ; and when we alighted, they all came by turns to salute us, and shake hands with us, first the men and then the women ; and they manifested great joy at seeing us. They lodged us in a large shed of boughs, which they erected on purpose, and (although Gentiles) planted a large cross in front thereof, and then went and fetched water to the camp for the people.

“ *November 2d.* This being All Souls’ day, we three priests said nine masses. We left Uturituc at 11 A. M., and at 3 P. M. stopped on the banks of the Gila, near the town of Sutaguison, having travelled about four leagues. The inhabitants of the pueblo (town), some five thousand souls, came out to receive and salute us with demonstrations of great joy. On the road we passed two other pueblos.”

At the period referred to, it appears that the Coco-Maricopas were not with the Pimos ; but in journeying down the Gila, at the distance of seventeen leagues from the villages of the latter, our travellers met with a tribe whom they call the *Opas* ; and fifteen leagues farther, they encountered the Coco-Maricopas, which,

says Font, "are the same as the Opas." By following the course of the river, which it appears the Fathers did, the thirty-two leagues they travelled from the Pimos, would bring them to the western end of the jornada, where they found the Coco-Maricopas.

It has been asserted that "the Maricopas have removed gradually from the Gulf of California to their present location in juxta-position with the Pimos."* I cannot learn that they ever were on the Gulf; although it appears from the missionary authorities, that there was a band of them on the western bank of the Colorado, "living in a valley thirty-six leagues in length, and, for the space of nine leagues, remarkably fertile and pleasant," who were "allied to the Coco-Maricopas of the Gila." But from the early accounts of the Indian tribes on the Gila, it appears they occupied the valley from a point west of the jornada, where Father Font found them in 1775, to the Salinas above its mouth. Father Sedelmayer met them in 1744, about the same place on the Gila, living on peaceful terms with the Pimos, and used them for his guides to the Colorado. It appears that at this time, too, they were living on the Salinas, in the very district that we passed over in our visit to the ruins on that river.

In his description of this country, Venegas † speaks of the river Assumption, which he says, is "composed of two rivers, the Salado and Verde." These, on their

* Emory's Report, p. 89.

† The Salinas, where it unites with the Gila, was originally called the Assumption. The San Francisco, which enters the latter from the north about forty-five miles from its mouth, was called the Verde (green) and also the Azul (blue) river.

way to the Gila, run through a very pleasant country of arable land, *inhabited by the Coco-Maricopas*, who are separated from the Pimos by a desert, although united to them in consanguinity. Their kingdom is bounded on the west by a desert and mountainous country, extending to the rancherias of the Yumas, who live along the river Colorado, but below its junction with the Gila.”*

It therefore appears that the Coco-Maricopas were found early in the last century on the opposite side of the jornada, or desert of forty-five miles, which reaches to the villages of the Pimos; and that thence they extended east, occupying the banks of the Salinas, to a point north of the latter, from which, as Venegas says, “they were separated by a desert.” They also traversed the country south of the Gila, where they are often located on the early maps.

It is not my intention in this work to enter into any ethnological disquisitions respecting these Indians; as they will form the subject-matter of another work. I will merely observe that, notwithstanding the deadly hostility existing between the Coco-Maricopas and Yumas, their languages are nearly the same. The Comeya, or Diegenos, of the Pacific coast, will also be found closely allied to them.

July 12th. In the hope that the Pimos might bring us in some mules, as promised, I determined to remain another day before leaving the Gila, and to employ it

* Venegas, History of California. Vol. II. p. 184. See also Clavigero, Storia de California. Hervas, Catálogo de las Lenguas. Vol. I. pp. 337 to 343.

in making a visit to the celebrated "Casa Grande" or "Casa de Montezuma," as it was called by our Indian friends, alike with all other ancient remains in the country.

I left early this morning, accompanied by Dr. Webb and Mr. Thurber, taking as guides two Pimo Indians, one of them *Misketaiish*, who spoke Spanish. We were all mounted on mules. After following the road for two miles, we turned to the east and struck General Kearney's trail, which we found still deep and distinct, although but the trail of a single file. It is sunk three or four inches in the hard gravel plain; and as it will continue to be followed by other parties passing along the Gila, as well as by the Indians, it may exist for centuries, an enduring monument of that remarkable campaign. General Kearney had with him a mountain howitzer. The narrow ruts made by the wheels were as distinct as though it had just passed along; the six years which had elapsed since the march of that officer, have scarcely begun to deface them.

After following this trail in an easterly direction, about eight miles across the plateau, which was covered with small mezquit trees, we turned off to the southeast. Another mile brought us to the building of which we are in search, rising above a forest of mezquit. For two or three miles before reaching it, I had noticed quantities of broken pottery, as well as the traces of ancient acequias or irrigating canals, along the bottom-land, portions of which we occasionally crossed on our left. This bottom is a continuation of that occupied by the Pimos, although much narrower, it being only a mile in width near the ruins. It is thickly

covered with mezquit-trees from twelve to twenty feet in height; among those on the plateau, the tall and graceful petahaya occasionally thrusts forth its thorny arms, like so many solitary columns or giant candelabra. The bright walls of the ancient edifice presented a striking contrast with the deep green foliage of the trees which surrounded it.

The "Casas Grandes," or Great Houses, consist of three buildings, all included within a space of one hundred and fifty yards. The principal and larger one is in the best state of preservation, its four exterior walls and most of the inner ones remaining. A considerable portion of the upper part of the walls has crumbled away and fallen inwards, as appears from the great quantity of rubbish and disintegrated adobe which fills the first story of the building. Three stories now stand and can plainly be made out by the ends of the beams remaining in the walls, or by the cavities which they occupied; but I think there must have been another story above, in order to account for the crumbling walls and rubbish within. The central portion or tower rising from the foundation, is some eight or ten feet higher than the outer walls, and may have been several feet, probably one story, higher when the building was complete. The walls at the base are between four and five feet in thickness; their precise dimensions could not be ascertained, so much having crumbled away. The inside is perpendicular, while the exterior face tapers towards the top, in a curved line. These walls, as well as the division walls of the interior, are laid with large square blocks of mud, prepared for the purpose by pressing the material into large boxes about two

feet in height and four feet long. When the mud became sufficiently hardened, the case was moved along and again filled, and so on until the whole edifice was completed. This is a rapid mode of building; but the Mexicans seem never to have applied it to any purpose but the erection of fences or division-walls. The material of this building is the mud of the valley, mixed with gravel. The mud is very adhesive, and when dried in the sun, is very durable. The outer surface of the wall appears to have been plastered roughly; but the inside, as well as the surface of all the inner walls, is hard finished. This is done with a composition of adobe, and is still as smooth as when first made, and has quite a polish. On one of the walls are rude figures, drawn with red lines, but no inscriptions. From the charred ends of the beams which remain in the walls, it is evident that the building was destroyed by fire. Some of the lintels which remain over the doors are formed of several sticks of wood, stripped of their bark, but showing no signs of a sharp instrument. The beams which supported the floors, were from four to five inches in diameter, placed about the same distance apart, and inserted deeply in the walls.

Hieroglyphic.

Most of the apartments are connected by doors, besides which there are circular openings in the upper

part of the chambers to admit light and air. The ground plan of the building shows that all the apartments were long and narrow without windows. The inner rooms, I think, were used as store-rooms for corn; in fact, it is a question whether the whole may not have been built for a similar purpose. There are four entrances, one in the centre of each side. The door on the western side is but two feet wide, and seven or eight high; the others three feet wide and five in height, tapering towards the top,—a peculiarity belonging to the ancient edifices of Central America and Yucatan. With the exception of these doors, there are no exterior openings, except on the western side, where they are of a circular form. Over the doorway corresponding to the third story, on the western front, is an opening, where there was a window, which I think was square. In a line with this are two circular openings.

The southern front has fallen in in several places, and is much injured by large fissures, yearly becoming larger, so that the whole of it must fall ere long. The other three fronts are quite perfect. The walls at the base, and particularly at the corners, have crumbled away to the extent of twelve or fifteen inches, and are only held together by their great thickness. The moisture here causes disintegration to take place more rapidly than in any other part of the building; and in a few years, when the walls have become more undermined, the whole structure must fall, and become a mere rounded heap, like many other shapeless mounds which are seen on the plain. A couple of days' labor spent in restoring the walls at the base with mud and gravel, would render this interesting monument as durable as

VIEW OF THE MOUNTAINS OF PERU

brick, and enable it to last for centuries. How long it has been in this ruined state, is not known; we only know that when visited by the missionaries a century ago, it was in the same condition as at present.

The exterior dimensions of this building are fifty feet from north to south, and forty from east to west. On the ground floor are five apartments. Those on the north and south sides extend the whole width of the building, and measure 32 by 10 feet. Between these are three smaller apartments, the central one being within the tower. All are open to the sky. There is no appearance of a stairway on any of the walls; whence it has been inferred that the means of ascent may have been outside.

On the south-west of the principal building is a second one in a state of ruin, with hardly enough of the walls remaining to trace its original form. The accompanying ground-plan will show what portions of the walls are standing. The dark lines represent the erect walls, the faint lines the heaps of fallen ones. The central portion, judging from the height of the present walls, was two stories high; the outer wall, which can only be estimated from the debris, could not have been more than a single story.

North-east of the main building is a third one, smaller than either of the others, but in such an utter state of decay that its original form cannot be determined. It is small, and may have been no more than a watch tower. In every direction as far as the eye can reach, are seen heaps of ruined edifices, with no portions of their walls standing. To the north-west, about two hundred yards distant, is a circular embank-

ment from eighty to one hundred yards in circumference, which is open in the centre, and is probably the remains of an inclosure for cattle. For miles around

Elevation of Casas Grandes, Rio Gila.

these in all directions, the plain is strewn with broken pottery and metates or corn-grinders. The pottery is red, white, lead-color, and black. The figures are

Ground Plan of Casas Grandes, Rio Gila.

usually geometrical and formed with taste, and in character are similar to the ornaments found on the pottery from the ruins on the Salinas and much further north. Much of this pottery is painted on the inside, a peculiarity which does not belong to the modern pottery. In its texture too, it is far superior. I collected a quantity of these fragments, from which I selected the larger pieces. Those containing the most

interesting patterns are represented in the accompanying engraving.

The origin of these buildings is shrouded in mystery. They were found much as they now appear by the earliest explorers of the country, who were told by the Indians that they had been built five hundred years before. One thing is evident, that at some former period the valley of the Gila, from this ruin to the western extremity of the rich bottom-lands now occupied by the Pimos and Coco-Maricopas, as well as the broad valley of the Salinas, for upwards of forty miles, was densely populated. The ruined buildings, the irrigating canals, and the vast quantities of pottery of a superior quality, show that, while they were an agricultural people, they were much in advance of the present semi-civilized tribes of the Gila. But this civilization extended far beyond the district named. From information given me by Leroux, it appears that ruins of the same sort exist on the San Francisco or Verde River; and Captain Johnston and Major Emory both saw similar evidences of wide-spread population far above the district in question. What connection this ancient people had with the Moquis and Zuñis, and with the "seven cities of Cibola," visited by Marco de Niza and Coronado, remains to be settled. This is strictly an ethnological question, requiring evidences and arguments which do not properly belong to this work. So with regard to the identification of particular tribes yet in existence as the descendants of this ancient race, philology renders us the most reliable aid. But I have omitted speaking of philological analogies, as they belong to another topic, and would

occupy too much space to be introduced here. Little has yet been done for the ethnology of the Indian tribes west of the Rocky Mountains, except by Mr. Hale, in his elaborate and admirable "Ethnology and Philology of the United States Exploring Expedition." But I have reason to believe, that when the various languages of Mexico, California, and of the tribes between the Colorado and New Mexico, are subjected to a rigid examination and comparison, some interesting facts will be deduced.

The most detailed of the early accounts of the ruins on the Gila is that of Father Pedro Font, to whose interesting and reliable journal I have before alluded. As these ruins have been misunderstood by many, and an important error propagated respecting them, I will give an extract from the diary of this missionary from the manuscript copy obtained by me in California :

"The Commandant determined that we should rest to-day, and thus we had an opportunity to examine the large building called Montezuma's House, situated at the distance of one league from the river Gila, and three leagues E. S. E. of the laguna. We were accompanied thither by some Indians, and by the Governor of *Uturituc*, who on his way related to us a history and tradition respecting said house, handed down from their forefathers, and composed altogether of fiction confusedly mixed with some Catholic truths. We carefully examined this edifice and its ruins, the iconographical plan of which I here lay down; and the better to understand it, I give the following explanation and description :

“ The large house or palace of Montezuma, according to the histories and meagre accounts of it which we have from the Indians, may have been built some five hundred years ago: for, as it appears, this building was erected by the Mexicans, when, during their transmigration, the Devil led them through various countries until they arrived at the promised land of Mexico; and in their sojourns, which were long ones, they formed towns and built edifices. The site on which this house is built is level on all sides, and at the distance of about one league from the river Gila, and the ruins of the houses which composed this town extend more than a league towards the east and other cardinal points; and all this land is partially covered with pieces of pots, jars, plates, etc.; some common, and others painted of different colors, white, blue, red, etc.; which is a sign that this has been a large town, inhabited by a distinct people from the Pimos of the river Gila, who do not know how to manufacture such earthenware. We made an exact survey of this edifice, and of its situation, which we measured in the mean time with a lance; and this measure I afterwards reduced to geometrical feet, which gave a little more or less than the following result:

“ The house forms an oblong square, facing exactly to the four cardinal points, east, west, north, and south; and round about it there are ruins, indicating a fence or wall, which surrounded the house and other buildings, particularly in the corners, where it appears there has been some edifice like an interior castle or watch-tower; for in the angle which faces towards the south-west there stands a ruin, with its divisions and an

upper story. The exterior wall extends from north to south four hundred and twenty feet, and from east to west two hundred and sixty feet. The interior of the house consists of five halls; the three middle ones being of one size, and the two extreme ones longer. The three middle ones are twenty-six feet in length from north to south, and ten feet in breadth from east to west. The two extreme ones measure twelve feet from north to south, and thirty-eight feet from east to west.”*

The Casa Grande, as described in this extract from Father Font, has been alluded to by many authors, and the dimensions, as given by him, quoted; but all have mistaken the meaning of the writer in the dimensions. He speaks of the house around which “there are ruins, indicating a *fence or wall* which surrounded the house and other buildings;” and then goes on to say, that “the *exterior wall* extends from north to south four hundred and twenty feet, and from east to west two hundred and sixty feet.” Nearly all the writers who refer to the building (and there are many, among which may be named Baron Humboldt himself*), quote these dimensions of the “fence” or “exterior wall,” as those of the edifice itself. It is possible that the manuscript referred to by Baron Humboldt differed from that in my possession; for the extract from Font’s journal, contained in Mr. Schoolcraft’s work on the Indian tribes, says: “The exterior

* Father Pedro Font’s Journal from Orcasitas, in Sonora, to Monterey, California, in 1775, ’76, ’77. MS.

† Political Essay on New Spain, vol. ii. p. 301.

wall *of the house* is four hundred and twenty feet," etc.* What follows clearly shows this to be an error; for it says, "the interior of the house consists of five halls," and then gives the dimensions of each apartment, which nearly correspond with my admeasurement.†

Mr. Gallatin is the only writer, as far as I know, who understood the greater dimensions alluded to as referring to an exterior wall. After giving the size of the building and its apartments from Father Font, he says, "Around the whole, there are indications of an external wall, which included the house and other buildings," four hundred and twenty by two hundred and sixty feet.‡

The earliest account of this building is that of Mangi, who, in company with Father Kino, visited it in the year 1694, on which occasion he said mass in it.§ His relation also exists only in manuscript. "There was one great edifice," says he, "with the principal room in the middle of four stories, and the adjoining rooms on its four sides of three stories, with the walls two yards in thickness, of strong mortar and clay, so smooth and shining within that they appear like bur-nished tables, and so polished that they shone like the earthenware of Puebla.

"At the distance of an arquebuss shot twelve other

* Font's admeasurement was in Spanish geometrical feet, which differ from the English foot of twelve inches.

† History, Condition, and Prospect of the Indian Tribes, vol. iii. p. 300.

‡ Trans. of Amer. Ethnol. Society, vol. ii. p. 86.

§ See extract from Mangi's Diary, in Schoolcraft's History and Condition of the Indian Tribes, vol. iii. p. 301.

houses are to be seen, also half fallen, having thick walls, and all the ceilings burnt, except in the lower room of one house, which is of round timbers, smooth and not thick, which appeared to be of cedar or savin, and over them sticks of very equal size, and a cake of mortar and hard clay, making a roof or ceiling of great ingenuity. In the environs are to be seen many other ruins and heaps of broken earth, which circumscribe it two leagues, with much broken earthenware of plates and pots of fine clay, painted of many colors, and which resemble the jars of Guadalajara, in Spain. It may be inferred that the population or city of this body politic was very large; and that it was of one government is shown by a main canal, which comes from the river by the plain, running around for the distance of three leagues, and inclosing the inhabitants in its area, being in breadth ten varas,* and about four in depth, through which perhaps was directed one half the volume of the river, in such a manner that it might serve for a defensive moat, as well as to supply the wards with water, and irrigate the plantations in the adjacencies."

By the foregoing extracts it will be seen that these buildings were in much the same condition as that in which we now see them, although a century and a half has elapsed since Mangi's visit. He was told of other ruins "a day's journey to the north on another stream" flowing into the Gila, which were doubtless those on the Salinas that I have described.

* About twenty-seven feet. See also Alegro's *Hist. de la Compañía de Jesus, en Nueva España*, tom. iii. p. 84.

I have been unable to learn from what source the prevailing idea has arisen of the migration of the Aztecs, or ancient Mexicans, from the north into the valley of Mexico, and of the three halts they made in their journey thither. This is another idea which has been so widely promulgated that it has settled down into an acknowledged fact, although I confess I have seen no satisfactory evidence of its truth. People have got too much in the way of ascribing all ancient remains to the Aztecs. We hear of them on the shores of Lake Michigan, where some have located the famous city of Aztlan. Other remains are spoken of in the Navajo country, south of the Great Salt Lake, where the Aztecs are said to have tarried a while. Again they are placed at the "Casas Grandes," on the Gila; whence they are supposed to have gone to a place north of the city of Chihuahua, where extensive remains are said to exist. The traditions which gave rise to this notion are extremely vague, and were not seriously entertained until Torquemada, Boturini, and Clavigero gave them currency, but they must now give way to the more reliable results from linguistic comparisons. No analogy has yet been traced between the language of the old Mexicans and any tribe at the north in the district from which they are supposed to have come; nor in any of the relics, ornaments, or works of art, do we observe a resemblance between them. The explorations and investigations recently made, and others now in progress, may throw further light on this subject, which I shall now dismiss.

After three hours spent at the ruins, the hottest, I

think, I ever experienced, we set out on our return to camp. Our Indian companions, having got out of water (of which we had none to spare), set off in advance to reach the river, and there wait for us. They were quite reluctant to go alone even a couple of miles, for fear of the Apaches; and I doubt whether they would have ventured even then without us, had they not been driven to do so by extreme thirst. As our canteens were all exhausted before leaving, we were obliged to follow their example. We found the river's bank about fifteen feet high, and so abrupt that it was with some difficulty we reached the water. After following the route by which we came, and crossing on our way several of the old irrigating canals, from which the ancient people who occupied the valley derived their water, we reached our camp at three o'clock, much fatigued though amply repaid by our day's excursion. The mercury had stood in the shade, beneath the trees, at 119° Fahrenheit, between the hours of ten and three o'clock.

I found a few Indians in camp, among them a messenger from Francisco Dukey, the Maricopa interpreter, who, ashamed to come himself, had sent another to me, begging that I would give him a written recommendation to show to other Americans. His request was peremptorily refused.

CHAPTER XXXIII.

CASAS GRANDES TO SANTA CRUZ.

Leave the Gila—Terrific storm on the desert—Encounter a party of Americans at midnight—Stopped by the darkness—Unpleasant situation—Pack-mules and cattle missing—Picacho mountain—Vegetation of the desert—Second night's march—Arrival at Tucson—General Blanco—Arrival of Mexican troops—Campaign against the Apaches—Meet Mr. Coons with 14,000 sheep—His disasters—Visit from Gen. Blanco and his officers—Repairs on wagons—Tucson and its valley—Meteorite—San Xavier del Bac—Beautiful church—Spanish and Anglo-Saxon colonization—Incessant rains—Presidio of Tubac—Meet Inez Gonzales, the captive girl—Her sad fate—Uncertainty of irrigated lands—California emigrants—Calabasa—Picturesque valley—Tumacacori—San Lazaro—More emigrants—Reach Santa Cruz.

July 13th. The heat continued excessive. The thermometer had ranged every day since our arrival at the Maricopa and Pimo villages at from 100° to 119° between the hours of 10 and 3; in fact it had scarcely fallen below 100 between these hours since we struck the desert beyond the Colorado. During the week we were at Fort Yuma, as well as during our journey, there was but little variation. The nights remained comfortable all the time; so that in the open air a single blanket was necessary.

Having a long march before us, we left camp at half-past 4 P. M., desiring to reach a mountain forty-five

miles distant, or half way across the great jornada, the following morning, although we had little hope of finding water until we should get to *Tucson*. The mountain referred to is called the "Picacho," a name applied to every high abrupt peak. Our course lay a little to the east of south, direct for the Picacho, across a vast open plain. A short range of mountains on the west, within a mile of the road, was soon passed. On the east was a lofty range fifty miles distant, with no intervening objects. The road was excellent; and our animals being fresh, we hurried them on as fast as it was prudent to do. As we progressed, there seemed to be a likelihood of rain, which was somewhat increased by a perceptible change in the air. The prospect before us was dismal enough, in the midst of the wide-spreading desert; for by night-fall we had passed the mountains on our right, and were soon far from any landmark.

As the sun sank below the horizon, the dark cloud-bank which we had observed far to the south ascended, and we could see the rain already falling on the distant mountain. Night now set in; the thick clouds rose higher and higher, and before nine o'clock had completely obscured every star. Shrouded as we were in darkness, it was no easy matter to find our way through the low mezquit bushes scattered over the desert. But nature's light-house opened its portals, and the vivid lightning flashed around us; so that the black mountain, our beacon in this desert, seemed constantly before us. Up to this time I had taken the lead in my wagon; but as my mules became alarmed, rendering it impossible to get along, I placed Mr. Leroux, who rode a milk-white mule, immediately before mine.

His animal could be seen, and all followed him. Peals of the most terrific thunder burst upon us, leaving scarcely an interval of repose. Next came violent gusts of wind, accompanied by clouds of sand and dust, reminding one of the African *simoom*. The wind was from the south, and brought the sand directly in our faces. To avoid it was impossible. Not a tree was to be seen; no ravine appeared where we could shelter ourselves; and the nearest mountain was yet twenty miles off. Lastly came torrents of rain, and this terrific storm was at its height.

Slowly we journeyed on, drenched to the skin, notwithstanding our overcoats and India rubber garments. The march before us must be made, and the sooner the "Picacho" was reached the better. To stop, was to endanger our animals; for no pools had yet been seen where the rain had accumulated, so that we had neither water nor grass to give them. At midnight, in the midst of this extreme darkness and rain, where one would about as soon expect to meet a human being as in the middle of the broad ocean, we were suddenly brought to a stand by the sound of voices! "Who comes there? Quien vive?" were quickly cried by a dozen voices in English and Spanish, and as quickly answered, "Friends! Amigos! Who are you? Where are you from? De donde viene?" etc., and in a moment we were surrounded by horsemen, pack-mules, and the accompaniments of a large party. Were they Indians, or Mexicans, or Americans—friends or enemies, ran through my mind, till the sound of English voices dissipated my apprehensions. It proved to be a party of between forty and fifty Americans,

bound for California. We stopped about ten minutes to exchange a few words, though we could not distinguish faces. This we were, in a measure, compelled to do, to separate our animals from those of the passing train, for all were now mixed up together. The party was from Missouri, and had come by the way of El Paso. They gave us some news from the latter place, which was very acceptable. Inquiries were made by each party about the grass and water on the route, when, the animals becoming restive, we bade them adieu, and resumed our journey.

Up to this time, the tempest had not in the least abated. Indeed the darkness seemed growing still thicker, while the flashes of lightning were becoming less frequent, which rendered it more difficult to keep on our course. After a longer interval than usual, the heavens were again lighted up, when I found myself going in an opposite direction to the right one, and the party much scattered. Leroux came up, and said that it was absolutely necessary to stop where we were; as some of the pack-mules were missing, and it was impossible to keep together or find our way in such impenetrable darkness. I accordingly had my mules taken out and hitched to my wagon; the same was done with the teams. All the pack-mules that could be found, were brought together; and the horsemen fastened their animals wherever they could find a bush. Dr. Webb and myself remained quietly in our wagon.

In the midst of the storm Mr. Thurber, with a great deal of perseverance, succeeded in making a fire. This was done by taking the leaves of some books that had seen their best days, and protecting them from the

rain with an India rubber coat, until well lighted. To these was added some dry wood found in the wagons; and when bushes were piled upon the whole, a blazing fire was the result. This served as a guide to our scattered people, some of whom had found themselves among the emigrating party, with their faces turned towards the Gila!

June 14th. As soon as we could see, the animals were mustered; when three mules with their packs, two donkeys, and our three remaining beef-cattle, were missing. Two Mexican arrieros were left to hunt up these animals, and the train resumed its journey. The road was now very muddy, and every depression in the desert became filled with water, making the travelling quite heavy.

Soon after starting we met the rest of the party that we encountered in the night. They had become separated from those in advance, and had been compelled to await the return of day. Among them were several women on mules, who appeared to have had a sorry time of it. The "Picacho" was still far ahead; but after watering the animals, we pushed on, and at 11 o'clock reached its base, where we encamped. I had been eighteen hours in my seat, and was glad to throw myself on the ground beneath the shade of a mezquit bush, and get some sleep. After an hour's rest I got up and made a fire for my cook, who was still deep in his slumbers; and by one o'clock we had our breakfast. This forty-five miles was the most fatiguing day's journey we had yet had, including the exposure during the whole night to such a tempest of wind and rain.

The vegetation of this desert is the same as that near the Gila, viz., dwarfish mezquit at intervals, larrea Mexicana, palo verde, and cacti; the great petahaya luxuriating as usual in the barrenness. A tuft of grass was occasionally seen, and now and then some brilliant flower that had ventured to "waste its sweetness on the desert air."

Ficacho of the Tucson desert, from the South.

The mud holes here were filled with water, but so turbid that we could not taste it. We had enough, however, in our canteens and kegs for drinking purposes. There was quite a thicket of mezquit here, and

an excellent place for a camp. The animals found a tolerable supply of food in the tufts of grass, and mezquit beans.

At 5 o'clock in the afternoon we started again, although we had had but little rest. I would have remained till morning, but our water was nearly out. The road had by this time become quite dry, and we rolled on at a steady gait of three miles an hour. Soon after leaving, the sky became overcast, and we feared a repetition of the storm; but it did not occur, and, although we had considerable difficulty in keeping our course, we were enabled to continue our journey through the entire night.

July 15th. At 5 o'clock this morning, being in advance of the train, we reached some mud holes containing a little water, which our thirsty animals drank with eagerness. During the night, many who were mounted on mules were so much fatigued as to be unable to retain their seats in their saddles; so dismounting, and tying their animals to the bushes, or to their bodies, they lay down on the desert, and refreshed themselves with a couple of hours sleep. At seven, the wagons with the rest of the party came up; and, although but eight miles from Tucson, such was our fatigue after two long nights' ride, that we determined to remain here to-day. Much to my regret, no tents were pitched; for a heavy shower came up in the night, which wet most of the party to the skin. I was so fortunate as to make my bed beneath a wagon; where, protected by an India rubber blanket, I passed a comfortable night, and scarcely knew of the rain that was falling around me until morning.

July 16th. We started with a heavy road, and made but slow progress. The wagons got mired several times in crossing arroyos, one of them so deeply that it became necessary to unload it before it could be released; while another, in passing a deep gully, plunged so suddenly down, that the tongue was snapped off.

We reached Tucson at ten o'clock, A. M. As we passed the garrison, a body of Mexican soldiers were entering, who had just arrived from the south on a campaign against the Apaches. Among the officers standing at the gate I recognised Captain Barragan, who was in command at Santa Cruz when we reached that place in October last. Hearing from him that General Blanco was within, I left the train and accompanied the Captain to pay my respects to him.

General Blanco informed me that the depredations of the Apaches had lately been more frequent than ever. Many animals had been stolen in the immediate vicinity of Tucson, Tubac, and Santa Cruz; and many Mexicans had lost their lives. The troops had had some skirmishes with the Indians, in which Coletto Amarillo, one of the chiefs who so frequently visited us at the Copper Mines, was killed. The General furthermore told me that when on his march he fell upon a large Indian trail, and noticed among the footprints several made by new American shoes, which he readily distinguished from the Mexican shoes by their larger size and heels. He believed that there were Americans among them, or that they had murdered and robbed some party of emigrants. In October, when the weather should be cooler, and the rainy season past, it was his intention to make a campaign against

the Apaches on the Gila, and thence go to the Mogollon Mountains, near the Copper Mines. After half an hour spent with the General, I rode a mile from the town, and there found my party encamped on the banks of the Santa Cruz River, where there was an abundance of grass.

Near our camp we found Mr. Coons, an American, on his way to San Francisco, with 14,000 sheep. For the protection of this large flock, he had sixty persons, forty-five of whom were Americans, and fifteen Mexicans. He quieted our anxiety as to grass and water, having found an abundance of both on his route. There had been much rain, and the grass was in consequence in fine condition. He had met many Indians near the Guadalupe Pass, but would not allow them to enter his camp. When near Janos, a party of Apaches rushed among them during the day, and succeeded in running off fourteen mules and horses. Mr. Coons was entirely unprepared for the attack, particularly as the rascals approached him from the town where they had been. Before he could get a party mounted, the robbers had got a long start of them, which rendered pursuit in vain. This loss so disabled Mr. C., that he was compelled to return to the city of Chihuahua, purchase more animals, and strengthen his party; which detained him six weeks. His party was now well armed, and he felt himself strong enough to cope with any roving band that might attempt to interrupt him.

General Blanco with his staff, and several other officers from Tucson, escorted by a troop of lancers, called on me in the afternoon. These lancers were well dressed and equipped, and made a handsome

appearance. I was by no means well prepared for the visit; for the wagon which contained my tent and baggage, being the one which had met with the accident before mentioned, had not yet reached camp: I was therefore obliged to receive him in another and very small tent, not large enough for one half the officers who accompanied him. It began to rain too at the time, which added to my dilemma. However, there were other tents pitched, in which these gentlemen took refuge. General Blanco again spoke of our common enemy, the Apaches, and of operations against them. He recommended that the American troops should attack them north of the Gila, while the Mexicans should receive them as they came south for refuge. I told him that my views agreed with those he had expressed, and that I had suggested a similar plan of operation to the United States government in a recent dispatch sent from California.

The General tendered me the use of his blacksmith's shop, and any other facilities I required to repair my broken wagons; of which I was very glad to avail myself, although we found it difficult to obtain a piece of wood for a new tongue. My little wagon also wanted repairs, and some of the animals required shoeing. There was, therefore, no alternative but to remain here a day or two. I would have regretted this delay more, had not the grass been so good that I believed the mules would be benefited by it. In the evening the rain set in hard, and continued during the night. But we were now in good tents, with water, grass, and wood around us, so that we had no cause for complaint.

July 17th. Sent the wagons up to the town ; but only one man was found who professed to be a blacksmith, and could work upon them. Sent four of my men up to assist ; but altogether they made little progress, for the want of tools.

Tucson is the most northern town in Mexico, and a very old place. It is found on the oldest maps, and is referred to by the early missionaries. It has always been, and is to this day, a presidio or garrison ; but for which the place could not be sustained. In its best days it boasted a population of a thousand souls, now diminished to about one third that number. It stands on the plateau adjoining the fertile valley watered by the Santa Cruz River, a small stream which rises ten miles north-east of the town of Santa Cruz, whence it flows south to that place. It then takes a westerly direction for about ten miles, after which it flows northward through Tubac and Tucson, and soon becomes lost in the desert. The lands near Tucson are very rich, and were once extensively cultivated ; but the encroachments of the Apaches compelled the people to abandon their ranchos and seek safety within the town. The miserable population, confined to such narrow limits, barely gains a subsistence, and could not exist a year but for the protection from the troops. More than once the town has been invested by from one to two thousand Indians, and attempts made to take it, but thus far without success. These Apaches have become reduced quite as much as the Mexicans ; so that two hundred warriors are about the largest force they can now collect.

In addition to the river alluded to, there are some

springs near the base of a hill a mile to the west of the town, which furnish a copious supply of water. Near these is a hamlet, and a large hacienda, which in former times must have been very rich. It is now in a decayed state, and but a small portion of its fine lands are cultivated. This hacienda is seen in the foreground of the annexed sketch of Tucson.

Wheat, maize, peas, beans, and lentils are raised in perfection; while among the fruits may be named, apples, pears, peaches, and grapes. The only vegetables we saw were onions, pumpkins, and beans; but in such a fertile valley all kinds will of course do well.

The houses of Tucson are all of adobe, and the majority are in a state of ruin. No attention seems to be given to repair; but as soon as a dwelling becomes uninhabitable, it is deserted, the miserable tenants creeping into some other hovel where they may eke out their existence. We found three hundred soldiers in the place, although the average number for some years past has not exceeded twenty.

The bottom-lands are here about a mile in width. Through them run irrigating canals in every direction, the lines of which are marked by rows of cottonwoods and willows, presenting an agreeable landscape.

I ascended a rocky hill above the hacienda mentioned, about a quarter of a mile from our camp, and had a fine view of the valley and surrounding country. This hill was covered with cacti of every variety, among which the petahaya was most prominent. The fouquiera, yucca, and agave, were also luxuriating

among the rocks; for scarcely a particle of soil could be seen. Below was the valley, its fields and acequias defined by the long lines of shrubbery and trees. The town is seen on the border of the plateau, where the desert begins, and stretches off to the east, to a high range of mountains about fifteen miles distant. In these mountains is a singular cliff of rocks resembling a huge castle. Like other mountain ranges, these take a south-easterly direction and extend nearly to the San Pedro. Directly south lies the valley of Santa Cruz, presenting to the eye an agreeable contrast to the barren mountains and the long line of desert on either side.

The two men left on the desert to hunt up the missing animals arrived to-day. They went back to the Pimo villages, and found the pack-mules following the emigrants that we had met.

July 18th. I went out this morning and completed my sketch of the valley and town from the hill visited yesterday. The men were still at work on the wagons, to be completed by evening. I bought some sheep here at three dollars ahead, as our live stock was getting low.

In the afternoon I called to take leave of General Blanco, and at the same time examine a remarkable *meteorite*, which is used for an anvil in the blacksmith's shop. This mass resembles native iron, and weighs about six hundred pounds. Its greatest length is five feet. Its exterior is quite smooth, while the lower part which projects from the larger leg is very jagged and rough. It was found about twenty miles distant towards Tubac, and about eight miles from the road,

where we were told are many larger masses. The annexed drawing gives the appearance of this singular mass. There is another larger mass within the garrison grounds, of which I did not take a sketch. With much labor Dr. Webb broke off a fragment of this meteorite for the purpose of analysis.

Nearly all our Mexican arrieros got drunk to-day, and caused much disturbance in the town. I would have discharged them, but could find none to take their places.

July 19th. We were off this morning before the sun had risen, and soon entered a thickly wooded valley of mezquit. A ride of nine miles brought us to the mission of *San Xavier del Bac*; truly a miserable place, consisting of from eighty to one hundred huts, or wigwams, made of mud or straw, the sole occupants of which are Pimo Indians, though generally called *Papagos*. In the midst of these hovels stands the largest and most beautiful church in the State of Sonora. It is built of brick on the summit of a low hill, and has two towers and a dome. In a square, around and directly connected with the church, are some adobe houses, which were occupied when the Mission was in a flourishing state. All save one are now tenantless, and this, which adjoins the church, is occupied by the only Mexican family in the place. The train passed directly through, while a few of the gentlemen and myself drew up at the church door to examine its interior.

This church has more pretensions to architectural beauty than any I saw in the country, although its general character is the same. It is elaborately orna-

METEORITE AT THE HACIENDA DE CONCEPCION, SHOWING OPPOSITE SIDES.

METEORITE AT TUCSON.—p. 298.

mented inside and out, and contains many decorations new in architecture, partaking neither of the Greek, Roman, nor Gothic orders. Along the eaves is a row of queer looking creatures, the like of which cannot probably be found, even in this country of strange animals. The interior is gaudily painted; and from the profusion of gilding, one might suppose the Mission to have possessed a gold placer. Around the altar, and in the niches, are many wooden statues, from the size of a foot to that of life. The poor Indian doubtless believed them all to be saints, and made his offerings accordingly, although about one half are statues of old Spanish cavaliers and figures of Chinese mandarins. There are besides angels and archangels, or figures intended to represent celestial beings with wings, five or six feet high, springing from the walls. This church was built towards the close of the last century from the produce of the Mission lands, and is throughout in a good state of preservation. It appears that there was a previous structure here, erected by Father Kino as early as 1700.*

What a marked difference there is in Spanish and English colonization! Here the zealous Missionary preceded all others, planting the cross along with the banner of his country. Then commenced the work of baptizing; and as soon as a sufficient number of converts had been made, a fertile valley was chosen, and a church erected with buildings to accommodate some hundreds. Next came the colonists, whose main efforts

* Alegre, Hist. de la Comp. de Jesus en Nueva España.—Tom. iii. p. 119.

were to support the Mission and its priests. The Anglo-Saxon pioneer entered the wilderness with his axe, his plough, and his rifle ; and after he had erected his own dwelling, the mill and blacksmith's shop rose up. Lands were brought into cultivation, the mechanic arts flourished ; and when the colony became large enough and rich enough to support a pastor, a church was built. For the results of the two modes of colonization, compare Texas, New Mexico, California, Sonora, and Chihuahua, before the three first became annexed to the United States, and the States of Ohio, Indiana, Illinois, and Michigan. The latter had attained more wealth, more population and importance, and had done quite as much towards promoting Christianity in the first ten years after their settlement, as the former States had in two centuries.

Near by is a fertile valley, a very small portion of which is now tilled : although from appearances, it was all formerly irrigated and under cultivation. I tried in vain to purchase vegetables. A more thoroughly lazy set of people, I never saw. The Pimo and Cocomaricopa Indians of the Gila, are infinitely superior to them. Whether a proximity to the church and the worthless half-civilized Mexicans has reduced them to this state of indolence and poverty, I know not ; but if so, they would better have remained in their native valleys, and never seen the faces of white men.

Leaving the village, we rode on a mile further, and stopped in a fine grove of large mezquit trees near the river, where there was plenty of grass.

We remained here until 3 o'clock, P. M., when we resumed our journey along the valley as before,

through a forest of mezquit trees, but had not proceeded more than an hour before it began to rain in torrents, the wind blowing directly in our faces. Believing the shower would soon pass over, I turned my wagon round and stopped. Those on horseback drew up under trees; but there was little shelter from them, so violently did the rain pour down. After an hour's delay, we pushed on. The road was now exceedingly muddy, the ravines and gullies were filled with water, and our progress was very slow. After journeying eight miles, making seventeen in all since morning, and being much in advance of the train, I deemed it prudent to stop. The wagons would not probably get in before night, after which, it would be unsafe to travel, owing to the washing of the road by the rains; for we had in many places to avoid it, and force our way through the woods.

The clouds indicated more rain; so I set to work and had a good fire in readiness for my cook when he should arrive. Those who were with me followed my example, and we soon had several large fires blazing, and a good stock of wood in.

As soon as the train got in, all hands set to work to pitch the tents, and take the necessary precautions to keep them in their places before the storm should be upon us. Guys were fixed to all the tents, which were further supported by being attached to the wagons; for the ground was so soft that the pins would not hold. Trenches were dug around each one, to keep it dry as possible; and we were quite ready for it, when the rain again began to fall. After a hearty supper, we retired to rest; but it was only to be routed

out again, for the storm soon increased in violence, and every moment we expected our frail coverings would be torn to shreds or blown down. And, in fact, notwithstanding our efforts to make them more secure, one of the tents was hurled from its fastenings and blown more than a hundred yards before it was arrested.

July 20th. The rain having continued the whole night, we were much delayed in getting off this morning. The whole country was drenched with water, and the road almost impassable for our heavily-loaded wagons. After a hard journey of eighteen miles, we stopped at the banks of the river; and strange as it may appear, notwithstanding all the rain that had fallen, the river, such is the uncertainty of the streams in this country, was quite dry. Fortunately, in some cavities in the river's bed we found water enough for our present wants.

Our march was a stragglng one to-day, as some of the teams could not keep up. My baggage wagon in particular, which also contained my tent and cooking utensils, did not get in until after dark. One of the mules broke down to-day, and was taken out of the team. Others showed signs of great exhaustion, from the heaviness of the road and the long march.

July 21st. It having rained most of the night, and every thing being wet, we were unable to leave before nine o'clock. After journeying over a muddy road for nine miles, we reached *Tubac*, another presidio or garrison, consisting of a collection of dilapidated buildings and huts, about half of which were tenantless, and an equally ruinous church. Captain Gomez, who com-

manded at Fronteras, at the time of my visit there with Colonel Craig in May, 1851, was in command here, and came out to meet us as we passed through the plaza.

To our infinite astonishment and regret, we learned that Señorita Inez Gonzales, the Mexican girl whom we had liberated from captivity, and restored to her parents at Santa Cruz in September, was living at this place with the officer just named. Captain G. himself, although acquainted with all the circumstances of her restoration, did not mention her name to me; but having been informed of the fact from others, I asked him if she was at his quarters. He replied that she was, but was quite ill, and furthermore that she was about to return with her mother to Santa Cruz. On telling him that I must see her, he invited me into his house, whither I was accompanied by several gentlemen of the Commission. The poor girl seemed very glad to see us. She was not ill, but evidently felt under some restraint, as the Captain remained during the interview. She seemed very sad and unhappy; and when asked if she would accompany us back to the States, as we had before invited her, she knew not what to say, and, fearing to give offence to her new captor, looked to him for a reply. The interview was a very unsatisfactory one, and we were all quite reluctant to leave her in such a position; but Captain Gomez assured us she would return home with her mother, who was then in Tubac. The next day we accordingly took leave, expecting that the party she accompanied would overtake us.

In a book of travels in a strange country, one is

expected to describe every town he visits; but as for this God-forsaken place, when I have said that it contains a few dilapidated buildings, and an old church, with a miserable population, I have said about all. It was established as a presidio almost a century and a half ago, and usually maintained a population of four hundred souls. It was abandoned a year before our arrival, but had since been repopulated, and might have comprised at the time of our visit a hundred souls. The bottom-lands near it, along the Santa Cruz River, are quite rich, and can be made to produce the same grain, fruit, and vegetables as at Tucson. At the rancho of Calabasa, in the same district, is a gold mine which was once productive, but the fear of the Apaches led to its abandonment.

As an example of the uncertainty of crops from artificial irrigation in this country, I will mention a circumstance which occurred at Tubac.

The preceding fall, after the place had been again occupied, a party of Mormons in passing through on their way to California was induced to stop there by the representations of the Comandante. He offered them lands in the rich valley, where acequias were already dug, if they would remain and cultivate it; assuring them that they would find a ready market for all the corn, wheat, and vegetables they could raise, from the troops and from passing emigrants. The offer was so good, and the prospects so flattering, that they consented to remain. They therefore set to work, and ploughed and sowed their lands, in which they expended all their means, anticipating an abundant harvest. But the spring and summer came without

rain: the river dried up; their fields could not be irrigated; and their labor, time, and money were lost. They abandoned the place, and, although reduced to the greatest extremities, succeeded in reaching Santa Isabel, in California, where we fell in with them.

We had got but a mile from Tubac, when one of the wagons broke down and became a total wreck. We were travelling on level ground at the time, and the accident was wholly unexpected. On examination, it was found that the rim and spokes of one of the wheels had become loose, and giving way simultaneously, the wheel was crushed. This let the axle-tree down with such force as to break off the end. A new fore-wheel and axle-tree were now necessary, together with some blacksmith's work, without which the wagon would be useless. I accordingly sent to Captain Gomez, to learn if he could render us any aid; but to my regret he sent me word that there was not a mechanic in the town, nor tools of any description. As there was no prospect of moving further until some change was made in our transportation, and perhaps some articles left, I gave orders to pitch the tents and turn out the mules, there being plenty of grass and wood near, with the Santa Cruz River, now full of water, within a hundred yards of us.

In the midst of our dilemma, and while we were pondering what to do, a train of some twelve or fifteen emigrant wagons hove in sight, and in a few minutes reached our camp. It was a pleasant event to meet a party from home once more; although they had no news to tell us, as they had left their homes in Arkansas in May, and had now been nearly three months on

their journey. The party consisted of forty persons, including men and women. Their wagons were all drawn by oxen, six of which were attached to each. As before, the chief inquiries were about the state of the road, the grass and water, and lastly the Indians. We learnt from them that there had been abundant rains on their route, and that the grass was excellent, and water abundant. This was cheering news to us, and better than we could give in return.

On conversing with the leader of the party, I found him disposed to sell one of his wagons; and after some parleying we agreed upon the terms, which were two hundred dollars. The bargain was no sooner made than the wagon was emptied of its contents, consisting of baggage and old furniture, and was taken possession of by us. It was a large, strong, and well made wagon, and bore the name of "ark," painted upon its side in large letters. It required some changes to adapt it to mules, which we at once set about making. In the mean time Mr. Leroux went to the town to try and sell the broken wagon, which only lacked an axle and wheel to be as good as ever. But the people knew that we must leave it behind us, and they declined to take it at any price. We accordingly stripped it of its tongue, coupling-pole, hounds, iron bolts, and nuts, broke up one of the wheels for tent-pins, and abandoned the remainder.

July 22d. We did not get the "ark" ready until noon, when we resumed our journey. The weather was now so moderate that we could travel during the day, which was a great relief to us. The road was good during this day's journey, and the new wheel

behaved very well. The valley continued about half a mile wide, thickly covered with mezquit trees of a large size. The bottom-lands resembled meadows, being covered with luxuriant grass, and but few trees. The immediate banks of the river, which is here as diminutive as near Tucson, are lined with cottonwood trees of a gigantic size, resembling our largest elms. In some places there are large groves of these trees, rendering this part of the valley the most picturesque and beautiful we had seen. At four o'clock, we reached one of these groves on the river's bank, where we encamped.

A mile before reaching camp, we passed the ruins of a large rancho known as *Calabasa*; for every large rancho or hacienda has its name and place on the map. Even after the establishment has been abandoned, and its walls have crumbled to the ground, the name remains. This custom is prevalent throughout northern Mexico. Along the valley of the Rio Grande and in New Mexico are a host of names on the map applied to ranchos, and sometimes to places where neither villages nor ranchos now exist. The same may be said of Sonora and Chihuahua, and where there were no settlements locations were given. A stranger on looking at one of these maps would imagine the country thickly settled, whereas there might not be a village, rancho, or even a single inhabitant, where he is treated to a long list of names, including half the saints in the calendar, all the apostles, and the Holy Lady of Guadalupe into the bargain.

This Calabasa, I was told by Leroux, was a thriving establishment when he visited it twenty years ago.

A large tract of land was then under cultivation, and herds of cattle were reared on the adjacent hills. But the stream did not furnish a sufficient quantity of water to irrigate it, without cutting off entirely the towns of Tubac and Tucson; and consequently it was abandoned. This is the difficulty with these small water-courses; for having few or no tributaries to keep up the supply, as our northern streams have, and frequently running a course of several hundred miles before they terminate, their water cannot be drawn off without destroying the crops below them, and even depriving the people and animals of water to drink.

I ascended one of the low hills here, about two hundred feet in height, which approached within one hundred and fifty yards of the river. This range crosses the stream, and runs far to the south on the western side. From these hills the plateau extends some ten or fifteen miles on both sides, when it strikes the mountain ranges. On the east is the mountain called Santa Rita, the highest within a hundred miles: in fact it is higher than any we had passed since leaving the Gila; and on its opposite side, where I was in September last, there is none of so great an altitude for one hundred and fifty miles. From the point where I stood, I could see the mountain at the base of which my party was lost last year in trying to reach Santa Cruz. This place was directly east of us, about twelve or fifteen miles distant.

During our journey to-day, some five or six miles back, I noticed the ruins of *Tumacacori*. Its beautiful and picturesque church showed finely among the thick grove of trees by which it is inclosed. The

church is a mile from the road ; and supposing that we should pass it, I made no inquiries, but kept on, until I got too far to return. It seems that there was a path leading to it, which Mr. Pratt and some of the horsemen took, but which I did not observe. Mr. P. took a sketch of it. *Tumacacori* was formerly a mission of note. It was connected with the presidio of Tubac, and had been lately abandoned in consequence of the incursions of the Apaches.

Passed to-day two parties of emigrants on their way to California. They each had from twelve to fifteen wagons, all drawn by oxen, and were from the State of Arkansas. Numerous questions were asked, as on former occasions, about grass, water, and the Indians. We learnt from these people that there were many parties of emigrants behind, and that we should probably fall in with them every day. The emigrants from Arkansas and Texas all take the southern route, by way of El Paso ; while those from the more northern States go by way of Independence and the Great Salt Lake.

A party of Mexican soldiers from Tucson overtook and passed us after we had encamped, carrying in a palanquin their Colonel, who was ill with a fever. As there was no medical attendant at the place, they were taking him to Arispe.

Soon after, a second party of soldiers stopped and encamped near us, probably for the sake of security against the Apaches ; for they feel perfectly safe when under the wing of a party of well-armed Americans. This valley is a favorite haunt of these freebooters ; and although we saw none, there is no doubt but they

both saw and followed us. They keep to the hills near by, where they can overlook the road, and are sure to pounce upon any small and unprotected party of travellers; for not a week passes without depredations and murders.

July 23d. The valley to-day was more contracted, owing to the proximity of the hills, which in many cases reached the stream, compelling us to cross them. The country grew more picturesque and diversified, exhibiting alternate valleys and gentle hills. In the former were groups of large walnut-trees, whose deep green foliage presented a striking contrast with the lighter and yellowish hue of the cotton-woods, and the brighter green of the willows. The intermediate spaces between the hills and the stream exhibited a luxuriant growth of grass. But it must be remembered that the enchanting aspect which every thing now wore in this valley does not continue. It was the rainy season, when vegetation presents its most attractive garb. In a few weeks the daily showers would cease, and the parching sun would dry up every thing but the cacti, which do not seem to be benefited by rain, and the large trees of the valley, which find moisture enough in the earth to sustain them until the rainy season again comes round. The grass then withers and dies, and the stream furnishes barely water enough to supply the immediate wants of the people.

Passed a party of emigrants with nine wagons, each drawn by ten oxen. The men were hardy and good-looking, being just such as are wanted in California. This train, as well as the others we had met,

had more oxen than were required to draw the wagons; but the owners were taking them to market as beef cattle, and found it much easier to yoke them to their wagons than to drive them loose. Some of these wagons drawn by five yoke of cattle did not contain more than five hundred pounds weight, while the capacity of the team would suffice for five or six thousand pounds.

At three o'clock, we encamped in a fine grove of trees near the river, having travelled twenty miles. A heavy rain set in just before we stopped, attended with thunder and lightning.

July 24th. Got an early start this morning. The valley grew still more contracted; in fact for miles there cannot be said to be any valley, the stream simply winding its way among the hills. Eight miles brought us to the old rancho of *San Lazaro*, where we found an encampment of fifty or sixty emigrants from Arkansas, bound for the land of gold.

Before these people knew who we were, they expressed much surprise at seeing a large and well-organized party going eastward; some exclaiming, when they saw we were Americans, "Holloa, strangers, haven't you mistaken the road—you're going the wrong way—this is the way to Californy!" Similar expressions were made by almost every party we met; but when they found we had been to California, and could give them some information about it, there was no end to their inquiries. All seemed to have their thoughts upon gold; for they invariably asked whether the yield continued as great as at first, what we thought of its holding out, etc., etc.

Several of this party were sick, particularly women and children. On hearing this, I stopped to give Dr. Webb an opportunity to visit and prescribe for them. The Doctor had done the same for other parties which we found were unprovided with medicines, or any of the comforts required in their condition. The constant rains they had been exposed to, with no protection but their wagons, had caused much sickness among them; and it was pitiful to see these poor emaciated and suffering creatures lying beneath the trees, resting a day or two, until they could recover strength enough to proceed.

In my former journey through Sonora, we stopped at San Lazaro, a large deserted hacienda, with extensive orchards and fertile grounds around it. Leaving this, we kept along up the stream, over a rough road, for nine miles, and reached Santa Cruz at eleven o'clock. Travelled distance to-day, seventeen miles.

I sent the train and party a mile beyond the village, to encamp where there was plenty of grass, and where the men would be away from the contaminations of a low Mexican population, miserable, filthy, and poor as this was.

I called on our old friend, Padre Bernardino Pacheco, and took breakfast with him. He had much to relate to us that had transpired since our last visit. The Apaches, he told us, had made several attacks on the people within half a mile of the town, and had carried off many of their mules and cattle, and murdered five of the inhabitants. The last attack was made two weeks before our arrival, when they were pursued by a party of soldiers, in which a Polish officer

in the Mexican service was shot by a rifle ball in his arm, from which wound he was then suffering severely. We also learned that the three men who joined us at Santa Isabel, California, and who left us on the desert at the time Colonel Craig was killed, had reached here about the time of the affray with the Indians. They took part in it, and one of them received a wound.

After a couple of hours spent in the town, I rode forward to our camp, where the tents and wagons had been arranged in a square, for the better protection of the men and animals in case of an attack from the Indians, who, we were told, were constantly prowling about the neighborhood, and watching an opportunity to surprise any party whom they thought unprepared, or to run off any animals not sufficiently guarded.

CHAPTER XXXIV.

SANTA CRUZ TO THE PRESIDIO OF JANOS.

Shoeing mules and repairing wagons at Santa Cruz—Standing guard—Sad fate of Inez Gonzales—Sickness of the town—Boldness of the Apaches and their constant inroads—Wretched state of the people—Leave Santa Cruz—Country assumes a new aspect—Rio San Pedro—Enter the mountains—Agua Prieta—Prepare for a fight—False alarm—Meet Col. Garcia with Mexican troops—Enter Guadalupe Pass—Wagon upset—Description of the country—A better route suggested—Take the Janos road—More emigrants, and their encounter with a bear—Two human bodies found—Open country—Reach Janos.

July 25th. At Santa Cruz. Since leaving Fort Yuma, we had had no opportunity to complete the repairs on the wagons, some of which were much injured and had been temporarily patched up with raw hide or otherwise. Besides the iron work to be done on these, many of the mules required shoeing. It was necessary, therefore, that this work should be done here, as we should have no other opportunity until we reached the frontier towns of Janos or Carrelitos in the State of Chihuahua, still nearly two hundred and fifty miles distant. The Guadalupe Pass, which we had twice been through, and with whose difficulties we were well acquainted, was yet before us, besides some very rocky mountain ridges. I therefore deemed it advisa-

ble to shoe the fore feet of all the team mules, leaving the pack and riding mules, with few exceptions, to go as they were. It would have been well to shoe them all; but the difficulties in the way of getting any thing done compelled me to dispense with such work as was not absolutely necessary.

There was a blacksmith's shop in the village, a bellows, and an anvil, but very indifferent tools. Then there was no charcoal, and no shoes or nails. The first step, therefore, was to send three or four men with pack-mules to the mountains for wood, and several others to guard them, and prevent a surprise by the Apaches. This obtained, we had to burn it into charcoal; and then three of our most ingenious men were dispatched to the blacksmith's shop, to assist in forging the shoes and nails, and in shoeing the animals.

I took my turn last night, for the second time, in that most disagreeable of all our duties, standing guard. The arrangements which we made before starting from the Pimo villages, where our escort left us, were, that two of the men should stand guard for two hours, commencing at 8 o'clock, and that this guard should be relieved every two hours until the camp was called in the morning, and the mules turned out to feed. But I was unwilling to trust to all the men, fearing that due diligence would not be observed. The officers therefore agreed, without exception, to take their turn; one to stand every night till 12 o'clock, and another from that hour till the morning. This was an arduous duty; but our safety absolutely required it. To rise before day and travel until three or four o'clock in the afternoon, and then stand guard half the night, was a

duty that we all felt severely, and each dreaded the night when his turn came. Last night was a very bad one, in fact, the worst we had experienced during our journey (the march across the Tucson desert always excepted), as it was exceedingly dark, and the rain came down in torrents. I kept a light burning in my tent the whole night, and made my rounds with a lantern. The strict watch kept by us during the march, no doubt saved us from robbery; and, if there had been nothing to fear from the Indians, it was a safeguard against the Mexicans, who are as great thieves as the Apaches. We had suffered much from theft in our last visit to Santa Cruz, and took good care that this pilfering should not be repeated.

In the afternoon I called on Padre Pacheco with Dr. Webb, to make inquiries about Inez Gonzales. The result was very unsatisfactory. He manifested an interest in the welfare of the poor child, but said that he had no control over her or her family, and that his influence or exertions would avail nothing against the plans or the doings of the military officers. Their power was supreme, particularly in an outpost like this. From all the information I could gather from the Padre, it was evident that unfair means had been resorted to by Captain Gomez; first, in getting her away from her home under some pretence, and secondly, in depriving her of her liberty, and preventing her return with her mother to Santa Cruz. I have not before observed that the mother overtook us the day after leaving Tubac, and accompanied our train to her now desolate home.

Believing that Governor Cubillas of Sonora, a gen-

tleman of high character and fine feelings, with whom I became acquainted at Ures, would interest himself for his young countrywoman, I addressed him a letter at length, requesting his interference on her behalf.

Dr. Webb was called upon to-day to visit many sick families—also the Polish officer who had been wounded in the fight with the Apaches, and Captain Murphy, the officer in command at this place. The town appeared to be very sickly, fevers being the prevailing form of disease. Of the troops here, which numbered a hundred men, thirty were disabled by illness. The prevalence of fevers arises from the proximity of a large marsh between here and San Lazaro.

In walking into town, I met parties of the inhabitants promenading. The women were neatly dressed, mostly in white, with dark rebosos over their heads; while the men who accompanied them were armed with muskets or lances, without which they never venture beyond the walls. Even at the distance of our camp, which was within a mile of the town, our visitors were invariably armed. So with those immediately under the walls tending cattle, or in the fields ploughing, all had their fire-arms at hand. Such is the state of things in this place. Of course, agriculture is neglected, and the people, being confined to that portion of the valley near the town, are able to raise barely enough for their own subsistence.

On one occasion last winter, a party of Apaches actually entered the town during the day, and drove off a number of mules. These robbers were within gun-shot of the garrison, from which they were perceived by a sentinel. Yet such was the terror they

inspired, that no attempts were made, either by the military or the inhabitants, to repel them or rescue the animals. Outside the walls were a number of cattle. These the robbers did not think proper to take, as they could not keep up with the mules. They therefore lanced them where they stood; and their bleached bones still remain under the walls, within a stone's throw of the dwellings, as testimonials of Mexican cowardice.

I cannot conceive what object there is in supporting this miserable population of less than two hundred souls, in an outpost where they are liable to the constant attacks and depredations of savages. The adjacent valley is not occupied, although one of the finest in the State. Better would it be for the government to take the whole population, not only of Santa Cruz, but also of Tubac and Tucson, remove them to the central parts of the State, and provide them with other land of equal value. As there are tracts equally good which are at present unoccupied, the government would be savers by this arrangement. The expense of maintaining a battalion of five hundred troops in this quarter for two years, is greater than would be the cost of removing the whole population in question. If this is not practicable, then the government should encourage emigration to these valleys, and enable the people to protect themselves. It is quite possible, and I think it probable, that the town of Santa Cruz will be eventually abandoned by the present miserable remains of its inhabitants; they will be compelled to this step to save themselves from starvation, or from being finally cut off by their more brave and warlike enemies.

July 26th. This day our teamsters and arrieros

took advantage of our delay here, to get drunk, and make a serious disturbance in the village. The authorities preferred a complaint against Jesus Lopez, a Mexican in the employ of the Commission, for ill treatment of a respectable woman, into whose house he unceremoniously entered and then beat her severely. They asked if I would punish him, or would allow them to do so. I sent word, in reply, that while we were in Mexico, we were amenable to its laws—that this man knew them, and if he had transgressed them, he must suffer the consequences. I afterwards heard that he was fined and imprisoned. He was the same man who killed the Apache at the Copper Mines, and had given me trouble at every settlement where we had stopped. I was therefore glad to get rid of him, and found no difficulty in filling his place. In fact, had I permitted them, half the population would have availed themselves of the opportunity that presented, to get away, it mattered not where to.

One of Lieut. Whipple's teamsters also got drunk here, drew his pistol on the Padre, and abused several others. This man was likewise imprisoned, but was liberated at the Lieutenant's request. To keep the men in camp was impossible. They would creep out at night; and if sent to the village on an errand, they would get drunk and kick up a row. Yet some of these very men were the best and most reliable in my employ, when on the march, and away from the contaminations of a low Mexican town.

The shoeing progressed slowly, it taking longer to make a nail than an American blacksmith would require to shoe an animal.

Padre Pacheco and another gentleman dined with me to-day. They came armed with swords and pistols; and I afterwards perceived that a deputation from the village, a portion of the good pastor's flock, fearful that he might be harmed, had followed him with their muskets, and waited outside my tent until he should return. The Padre brought me a bottle of wine, and another of excellent vinegar, which was very acceptable, together with a few vegetables; in return for which, we gave him a few articles that he could not obtain here.

Dr. Webb was engaged the whole day in gratuitously attending upon the sick. In the afternoon, a heavy rain set in.

July 27th. A large party of emigrants from Arkansas, via El Paso, arrived just before night, and encamped near us. They had twenty wagons, each drawn by five yoke of oxen. Soon after their arrival, they applied to me for flour. I told them I had barely sufficient to take us to El Paso, and directed them to apply to a mill in the town where it was for sale. I heard afterwards that they made a demand on the Padre for provisions; and that they treated him rudely, sitting down without ceremony in the little piazza at his door, where they commenced playing cards with each other, and annoyed him exceedingly by their boisterous manner and insolence.

July 28th. Our repairs and shoeing being completed, we resumed our journey early this morning. Many of the inhabitants earnestly begged to be employed or to be permitted to accompany us, offering to aid us in any way in their power, without compensation. Feeling

pity for the poor creatures, I told several that they might accompany the train, if they would furnish their own provisions and transportation. Four of them followed us on foot; and I afterwards found that the Mexican arrieros, and the cooks, kept them at work when in camp in bringing wood and water, as well as in herding the mules, and gave them their food for so doing.

Hearing from the emigrants who arrived last evening, that the road taken by them from the San Pedro river was very bad for loaded wagons, I determined to avoid it by following a path little known, which was some ten miles further. Instead, therefore, of passing directly over the hills on leaving the valley, we kept on three miles to the termination of these hills, and then took an easterly, though very tortuous course, keeping most of the way in valleys, and avoiding the mountains altogether. As we passed out of the valley, I observed a long train of wagons winding over the hills on the other road, accompanied by many horsemen. This was an emigrating party, which we had been told we should meet; but we were not near enough to speak with them.

After winding through these valleys for four miles, we ascended to the plateau, to which we kept for six or eight miles over a smooth gravelly plain, without a tree or a bush. The valleys below were studded with small oaks, and covered with luxuriant grass; in fact, I was told at Santa Cruz, that in former years large herds of cattle were raised here. The country seems admirably adapted for the purpose, and in other hands, or when the Apache robbers are exterminated, will

again become a grazing country. Not a head was now to be seen; nor is there another settlement, a single habitation, or a spot of cultivated ground between Santa Cruz and Janos in the direction we were travelling. At two o'clock the rain began to fall in torrents; and soon after, seeing a small basin of water near a grove of large walnut trees, we stopped and encamped, having travelled fifteen miles.

This was the first day, since leaving the valleys of California, that we had met with oak groves and broad pastures. The whole country here assumed a new aspect, resembling the hills and valleys of Vermont or New Hampshire, rather than Mexico. Involuntarily we looked at the turn of every hill, as we wound through the valleys, to meet with farm houses, cultivated fields, herds of cattle, and an agricultural population; but all was silent as the grave. An occasional wolf sneaked across our path, or a herd of antelope bounded over the plain, reminding us that we were far from all human habitations.

July 29th. The road or path we travelled yesterday was very faint, and could no longer be traced. Our only course, therefore, was to follow the valley, which we knew must lead to the San Pedro. After keeping along it for three or four miles, Leroux set off over the hills, to see if he could find any trail. He at length found one, which he recommended us to take; as following the valley might lead us to some cañon, and thus involve us in difficulties. We therefore altered our course from east to south, which we kept for four miles, and then entered the old road. Near this, we met two suspicious looking characters with guns,

an unusual event in these regions. We first discovered them at a distance, and on applying our spy-glasses, were still more puzzled, as they resembled Americans. On coming up, they proved to belong to a party of emigrants ahead, which they had left some hours before in search of deer or other game. They seemed as much surprised as ourselves at the meeting, and had many questions to ask. Their party was short of provisions, about which they felt more anxiety than about the state of the road or the grass.

After striking the road, our course was again due east through a fine valley watered by a small stream; the western tributary or source of the San Pedro. We followed this valley for about six miles, and met a train of twenty or twenty-five ox-teams, with emigrants for California. We stopped a few minutes to exchange news with them, as well as to ask sundry questions about the state of the road, grass, water, and Indians; the result of which was more satisfactory to us than to them.

On the south side of the valley we were traversing, were bold rocky cliffs, about a hundred feet high; while on the opposite side, it was bounded by low hills of gravel. The valley was covered with grass, but not a tree or shrub was visible. We crossed the stream over a rocky ledge, where there was but a few inches of water. Shortly before reaching it, we passed on our right the ruins of a village, which appeared to have been long deserted. Amid these ruins, on the summit of a hill, there seemed to have been a fortification. We encamped directly by the crossing near the base of a hill, where there were traces of previous

encampments. We estimated the distance travelled to-day at fourteen miles, making altogether, by the route we had come, twenty-nine miles from Santa Cruz; while the usually travelled road does not exceed eighteen. Yet I would advise all travellers with wagons to turn to the right after crossing the San Pedro, and take our route, thereby avoiding one of the worst mountain passes in the whole distance to California. With pack-mules, the shorter route should of course have the preference.

July 30th. Passing round the base of the hill near our camp, we ascended the plateau, and then pursued a course due east, over a plain as level as a floor, and without a tree or shrub, covered with short grass that had sprung up since the rains. Five miles further, we again descended into a valley or bottom, through which ran a small stream, where we met another party of emigrants. After keeping the bottom for five miles, we reached a swampy place, caused by a recent accumulation of waters from the heavy rains. In the midst of this was a stream, or rather, I think, a gully, filled with water, which was running very rapidly. It was from two to three feet deep, and full of deeper holes, so that even the horsemen met with some difficulty in crossing. Fearing that we should break the tongues of our wagons in plunging down so abrupt and short a bank, the picks and spades were got out and both banks cut down; we then all got over in safety.

Crossing this boggy plain, our course continued eastward, through a bottom, for about six miles, the plateau bounding the valley on both sides. In the afternoon we began to ascend gradually through the

same valley, and at half-past three encamped near a stream, where the water merely stood in holes. It was very good, though, from appearance, not permanent. Near us was a large cotton-wood tree, the only one to be seen; so that it was with difficulty we could find scraps of wood enough to cook our dinner.

From our camp we could see the mountain near Santa Cruz bearing due west. The rain set in before night, and continued several hours; and as we were in a very exposed situation, it was necessary to put extra fastenings to the tents. Distance travelled to-day, fifteen miles.

July 31st. Every thing was drenched with rain, which prevented an early start. We still kept due east, through an open defile in a mountain range, which ran north and south, with an easy and gradual ascent. On both sides were conical hills from three to four hundred feet in height, detached from the adjacent mountains, and destitute of trees and shrubbery. In fact, scarcely a tree or bush had been seen since we left the vicinity of Santa Cruz. As the country continued bare to day, the men picked up every fragment of wood or brush we passed, and threw it into the wagons. It would be prudent for all parties travelling this country to provide themselves with wood whenever an opportunity offers, and always keep on hand a supply for three days. We were told by all the emigrants we had passed, that their greatest difficulty had been to procure fuel; and they cautioned us to secure it when we could, and not wait until we encamped.

At two o'clock the rain began to fall; but as there

was no water to be seen, we were reluctantly compelled to keep on until near night, when we reached a stream, called by Leroux "Ash Creek," where we encamped. He said it was the same place where Colonel Cooke stopped with his battalion in 1846, and from which several parties were sent out in search of water, as it was then dry. The stream is so called from the ash trees which grew near it, but which have now nearly disappeared. It is the toughest and best wood for repairing wagons; and passing trains have stopped here to cut new tongues, and make other repairs. Distance travelled, twenty miles.

August 1st. Our general course was still east, through defiles in the mountain's ridge we were then crossing, for about four miles, when we emerged into an open plain from twenty-five to thirty miles across. Keeping the same direction, slightly descending for nine miles, through a level plain covered with mezquit chapporal, we reached *Agua Prieta*, or the "Black Water Creek" of Colonel Cooke. My readers will recognise this as the spot where I encamped at the time of my visit to Fronteras in May, 1851, when I was accompanied by Colonel Craig and a small party. It was then dry; but now it was filled with a dark muddy water, whence it derives its name. This, like many other small streams we had lately passed, we now know is not permanent. After heavy rains, it receives the washings of the broad plains, which rise gradually on either side for many miles.

As the next water we expected to find was at San Bernardino, eighteen miles distant, I thought it best to go no further, although it was but twelve

o'clock, and we had come not over thirteen miles. But as there was a bright sun, we could not do better than devote the remainder of the day to drying our tents, blankets, saddles, and every thing that had been carried on mules. The packs were therefore overhauled, and their contents, as well as the bedding, spread out to dry. The road to-day had been excellent, as it had for the most part since leaving Santa Cruz.

Towards evening, an alarm was given by the Mexican arrieros that the Apaches were upon us, and after our mules, then a mile off. All flew to arms; and in two minutes every animal about the camp was saddled, mounted, and off in pursuit, or rather to the aid of our *caballada*, which we could see approaching at full speed, followed by the herdsmen and arrieros, yelling and screaming at the top of their voices to keep up the stampede. The mules were evidently as much frightened as the Mexicans; and such a state of commotion we had not beheld since we left California. Far across the plain we could see the supposed enemy approaching on horseback, making directly for the camp at full speed. Having got my rifle ready and cocked, I drew out my telescope to ascertain the number of the enemy, now about a mile off. To my great relief, I perceived that several were clad in dark coats, and that all wore hats, some of them black. This showed that they were neither Apaches nor Mexicans; for the former do not wear hats at all, and the latter at this season wear white calico shirts, with straw hats. In a few minutes the supposed enemies were with us, and proved to be a party of American

emigrants in advance of a train of wagons, which our people did not see, or they would have caused no alarm. Perceiving the stampede they had caused, and hearing the yelling of the arrieros, they had hastened forward to quiet our fears.

This party consisted of thirty-five persons, men, women, and children, with mule-wagons and horses, from Arkansas and Texas. Their wagons had turned off to the left to a spring, where there was better water than in the stream two miles below us. After spending an hour in giving us some interesting news from our friends at El Paso and on the Rio Grande below that place, they took leave of us and rejoined their party. They had seen a party of forty or more Apaches two days before near the Guadalupe Pass.

August 2d. We moved off at seven; the morning clear and pleasant, and with the satisfaction of having dry tents and clothing once more; for we had escaped the rain last night, probably from being so far from the mountains. Our course was still east, across the plain, to a high conical mountain capped with a rocky bluff. The road was excellent until we reached the base of this mountain, when it became hilly, though not bad. After winding among these hills for three or four miles, we again emerged into a broad plain, in the middle of which stood the ruined hacienda of San Bernardino. We now descended again very gradually over a plain filled with mezquit chapporal, and six or seven miles further brought us to the hacienda. Distance travelled, eighteen miles.

Just as we were entering this plain, we met Colonel Garcia, with a detachment of two hundred Mexi-

can troops from Tucson, on a campaign against the Apaches. A more miserable set of men I never met, certainly none calling themselves soldiers. Some of them were destitute of shirts, others of pantaloons, and some had neither coats nor hats. Some wore overcoats, without a rag of clothing beneath. They had seen no Indians, as might be expected, although forty were observed here the day before. In all probability the wily enemy had perceived them, and would follow them, in the hope of stealing some of their animals, and piercing some of them with a lance or an arrow.

These campaigns against the Indians are utterly useless, nor can they be attended with success. During the last two years that the Mexicans have been operating against them on this frontier, not fifty have been killed. The Indians are too cunning to risk an open fight, even with such antagonists. Their mode of warfare is by stratagem, and they must be encountered with their own weapons.

August 3d. We kept on our easterly course towards the Guadalupe Mountains. Met a train of ox-teams with emigrants from Arkansas, and soon after entered the famous cañon, where there was an abundance of water and grass. In passing a small ravine, one of the wagons upset, discharging its contents upon a poor Mexican who happened to be seated inside, because too ill to sit upon his mule. Dr. Webb was sent for, but found the man not seriously injured. Fortunately the wagon was not broken; so that after a little delay all was made right again, and the train continued through the defile until three o'clock, when we stopped and pitched our tents where the road

takes a sudden turn, and leads over the mountains, through the much-dreaded Guadalupe Pass. I noticed near this spot traces of a large encampment, which Leroux said was one of Colonel Cooke's in 1846.

August 4th. We commenced the ascent of the mountain immediately after leaving camp; and the animals being fresh, we reached the summit of the first hills with ease. I took my rifle and set off on foot, keeping near the train, as it would have been imprudent for the party to scatter in such a place. The descent of the first hill was difficult, being full of short turns, rocky and very steep. About half way down, we took the mules out of my wagon, and let it down by hand, the driver taking the pole, while four of us held it back until it reached the bottom. The baggage and subsistence wagons were got down in safety by attaching ropes behind and to one side, to which ten or a dozen men held on, thus preventing them from upsetting or making a too sudden descent. The only vehicle that met with an accident was that containing Lieutenant Whipple's valuable instruments. Although more pains were taken with it than with any other, it was upset, and its contents thrown out, but happily without any damage either to the instruments or the wagon.

The worst is a chalky hill, near the last in the pass. It is exceedingly smooth and steep, with short and very abrupt turns, so as to render it impossible to double a team, or even hitch six mules together to advantage. To ascend this place with loaded wagons, is impossible. I sent Leroux off in the morning in advance with the pack-mules, directing him to pass all

the hills, then discharge his loads, and return and meet me at the base of the chalky hill mentioned. I found him there on my arrival; and we set to work at once to discharge the wagons. This being done, the contents were put upon the backs of the mules, which were sent ahead again to deposit their loads. We then took hold of the wagons; and by alternately pushing them and chocking the wheels, the mules got them up this formidable ascent with comparative ease. While this was going on I took a sketch of the pass, which will convey a better idea than a written description. It will be found in the first volume.

On the summit of the hill we met a train of wagons with forty persons bound for California. They were a substantial hardy looking set of people, and had been four months on their journey from Arkansas.

A magnificent view of the country in every direction is obtained from this spot. On looking back the way we had come, the whole pass with its defiles and mountains, its forests of oaks and pines, its deep gorges and grassy valleys, lay before us; while in the very centre, protruded a huge pile of rocks of a light green and whitish color, presenting a pleasing contrast with the rich hue of the foliage around. Some of the hills were covered with grass, and others were dotted with clumps of cedars, although small live and post oaks predominated. Beyond the pass could be seen the high conical mountain beyond San Bernardino; and in the dim distance, an elevated chain near the San Pedro River, at the base of which we passed. The perspective of these receding mountains, the furthest more than a hundred miles distant, was exceedingly beautiful.

Before one o'clock we had passed all the hills; when the wagons were reloaded, the mules packed, and we continued our journey. I here turned off and took the old Janos road, believing it to furnish a shorter route to El Paso than that by the Copper Mines, which we took in our journey into Sonora last year; besides I was desirous of varying my course, and examining the country further south. This road has been travelled for nearly two centuries, or since the first settlement of the country. It is the only route practicable for wagons between Chihuahua and Sonora, and was only made so by Colonel Cooke. Nor is there any other for pack-mules, except one a short distance to the south leading from Correlitos to Babispe. Further south the great Sierra Madre is impassable for more than five hundred miles.

When Colonel Cooke set out from Santa Fé for California, he came down the Rio Grande to the present ford at San Diego, and thence to Ojo de Vaca. His most direct course would then have been west across the unexplored region lying between that place and the San Pedro; but as his guide, Leroux, knew nothing of that country, he deemed it prudent, when so many lives were dependent on him, to follow a route with which he was acquainted. Accordingly he led them in a south-westerly course to the Guadalupe Pass, through which he knew there was a trail from Janos. In reaching this he had to pass over a district of fifty-two miles to Las Playas without water, in which his men suffered severely from thirst; and on reaching the pass, he was obliged to cut a road for his wagons, as wheeled vehicles had never before gone that way.

Emigrating parties, and all others, are much indebted to this gallant officer for opening this road, which otherwise would have remained in its ancient condition to the present day. But with all the labor that has been or may hereafter be bestowed upon it, it can never become the great thoroughfare for emigrants to California. The mountain pass must always remain an impediment. The long tract from Ojo de Vaca to the Playas without water, is another; and the Guadalupe Pass presents the same difficulty in the dry season. A fourth objection is the distance, which is fully a hundred miles greater than a course nearly west from Ojo de Vaca, coming out near Tucson.

The latter route was taken by the Commission last year, and the longest stretch without water was less than forty miles. Our government should send out a party to make explorations within our line of boundary; when, I doubt not, a route would be discovered which would shorten the distance at least one hundred and fifty miles, besides furnishing wood, water, and grass in abundance. It is desirable, too, that we should have a road as far as possible within our own territory, and not pass, as at present, the whole distance from El Paso to the Colorado through that of Mexico.

The summit which we had now attained, by a tortuous ascent of from ten to fifteen hundred feet in fifteen miles, is the level of the great central plateau. A broad plain here opens to the view eastward and southward, extending far and wide, with short detached ridges of mountains, running generally from north-west to south-east. Our course was south-east, to a range of mountains whose direction is east and west, fifteen miles dis-

tant. This great plain is lost in the horizon at the north-east, there being no mountains in sight; in a south-westerly direction, the Guadalupe range is seen some fifty miles distant, verging eastward, until it unites with the great chain of the Cordilleras.

Our course lay towards a portion of the mountains where I presumed the pass to be. The plain was perfectly level and the road excellent, without a stone, a tree, or a bush. When we had reached its centre, where there was a slight depression, we found that the drainage of the adjacent slopes had made it so miry as to be impassable by the direct road. We therefore diverged to the right, keeping on higher ground, and got safely across. At 3 o'clock it commenced raining, with the wind from the south-west, when we would gladly have stopped; but there was neither wood nor water at hand. We were, therefore, obliged to keep on another hour, when a spring with a small pool of water was discovered at the base of a plateau or terrace which extended about three miles from the mountains. Here we encamped. Estimated distance travelled, eighteen miles, including the Guadalupe Pass. Grass was abundant around us, and some oaks half a mile distant furnished us with fuel.

August 5th. We kept along the terrace for three miles, and then entered a defile which led directly across the lower portion of the mountains. This defile was at first of easy ascent, through groves of small oaks and cedars, and over a carpet of rich verdure. From this the road led directly up a hill, which, though not steep, was a very hard one for the animals, being wholly composed of loose and rolling stones. The poor

creatures had a severe tug of it; and although I ascended slowly on foot, I reached the summit nearly an hour before all the wagons got up.

Here we found a party of from forty to fifty emigrants with ten ox teams. While waiting for our wagons to come up, we seated ourselves beneath the trees, and entered into conversation with these people, who were quite an intelligent party, both of men and women. The usual inquiries were made of us about the road and the prospects in California. The women were very inquisitive, chiefly as to the difficulties they had yet to encounter. They had already been five months on their journey from Arkansas, and had lost several of their party by death; and one of the men had had a narrow escape from a large brown bear but an hour before, on the hill we were now about to descend. The skin of the animal lay before us, bearing authentic testimony to his immense size.

It seems that as three of the men were scouring the adjoining woods, one of them discovered this bear, and discharged his rifle at him. The bear limped off into an adjacent thicket; the man followed; and as he approached the animal's place of concealment, the infuriated creature sprang from the thicket and seized him. He was of course thrown, when a hard struggle took place for the mastery. The bear bit him severely in the leg; while the man, after a violent effort, succeeded in getting his knife from its sheath, and plunged it into the animal's body. The struggle took place on the brow of a steep hill, and near the brink of a precipice some twenty feet in height. Over this they both fell together, the bear, fortunately, being underneath,

and striking on his back. This saved the man from injury, and released him from his antagonist's embrace. Lacerated as he was, he arose and prepared to act on the defensive, expecting the bear would again give battle; but the latter, not feeling very comfortable from his wounds and his fall, stood quietly gazing at the man, for some moments, and then leisurely turned around and walked away. The man was not so badly injured as to prevent his walking; and, as soon as the bear was out of sight, he called to his companions, and pointed out the direction taken by the animal. Following the track, they soon discovered him, and dispatched him with a couple of well-directed shots.

We now descended the opposite slope of the mountain, which, though long and tedious, was not precipitous. Reaching the base in safety, we stopped on the banks of a beautiful little stream, which had its source in the mountain. Here it was thought advisable to water the animals and make a noon halt, as it was uncertain whether we should find water again for many miles. After a delay of three hours, which afforded us an opportunity to dine, we resumed our journey, keeping near the stream for three miles, and then striking off into a very broad and level plain from twenty-five to thirty miles across, on which not a tree or a bush was to be seen. Low gravelly hills of a conical form rose from the plain on our left from fifty to two hundred feet in height, covered with grass, but destitute of trees. On our right, about four miles distant, rose a high and isolated mountain with bold rocky sides. Opposite this we stopped at nine o'clock and encamped without water, having travelled twenty miles.

August 6th. We continued our journey across the plain in a direction east south-east. With the exception of a little rise of ten feet, to reach a gravelly plateau, the whole plain had been a perfect level since we entered it the day before. It was entirely open on the west, being limited in the far distance by the Guadalupe Mountains, while on the east none were seen.

This great plain, from its position and extent, I think unites with that we crossed on Cooke's road, at the dry lake or "La Playa;" for when there, I noticed that the plain stretched far to the south-west, unlimited by the mountains.

Our attention was arrested to-day by the sight of the remains of two human bodies, but whether of Mexicans or Americans we could not determine. What was left of their clothing consisted of white shirts and narrow white cotton drawers. The latter article is not worn by Mexicans, which led us to suppose the murdered men might have been our countrymen.

In the afternoon we crossed a fine clear stream, thirty to forty feet wide and about two deep, occasionally expanding into ponds twice that depth, and encamped on the opposite bank where there was excellent grass. This stream is a branch of the river which passes Janos and Correlitos, the latter being known both as the San Miguel and as the Casas Grandes River. Like other streams in Mexico, it takes the names of the several towns it passes. In it we caught a sufficient number of trout to give us all a meal. We also collected specimens of unios, which abound here. About a mile to the east, several large adobe houses were seen belonging to an estate which had recently been

abandoned in consequence of the depredations of the Indians. Distance travelled, twenty miles.

August 7th. We resumed our journey, keeping along a terrace of gravel about ten feet above the plain. The road continued excellent, as it had been since leaving the Guadalupe Pass. In eight miles we passed around the southern extremity of a hill, from which a gentle descent of a mile brought us to the old Presidio of Janos, the extreme outpost of the State of Chihuahua.

CHAPTER XXXV.

JANOS TO CORRELITOS, AND VISIT TO CASAS GRANDES.

Janos, an old military post—Its decline—Aid a party of American emigrants—A Thomsonian doctor—Difficulty in fording the Casas Grandes River—Arrival at Correlitos—Smelting works—Unhealthiness of the people—Barranca Colorada—Visit to the town of Casas Grandes—Extensive ruins—Resemblance to those on the Gila—Fertile valley—The river and its tributaries—Modern town—Return to Correlitos.

It is so rare an event for trains or travellers to enter Janos from the west, that our approach created quite a sensation among its quiet people. We stopped in the main street as we passed along, and were at once accosted by some Americans, who advised us to encamp near the river on the opposite side of the town ; which we did, and found good grass near.

Janos is one of the seven presidios or military posts, a line of which was formed along the frontier as early as 1718. The others were Galeana, Carrizal, Norte, Coyome, San Eleazario, and San Carlos. These posts were of great service in subduing the Indians and protecting the inhabitants, and were connected with a greater chain which extended from San Antonio in Texas to San Francisco in California. A direct and constant communication was kept up between these

posts until the period of the subversion of the Spanish rule. They have since been retained and occupied for the same purpose as before, but have dwindled from respectable garrisons of well disciplined soldiers, to a mere handful of raw militia, as undisciplined as they are wanting in bravery.

In the year 1826, the force in Janos consisted of six commissioned, and ninety non-commissioned officers and privates, and was supported at an annual cost of \$26,894. It now numbers twenty soldiers; but this force is augmented from time to time by larger bodies of troops, when sent on campaigns against the Indians.* Like every other frontier town which we had visited, whether in this State or in Sonora, its population is diminishing, and its houses falling to decay, in consequence of the inroads of the universal enemy, the Apaches. The present population is but three hundred, and even these dare not venture far beyond the town, but lounge out a miserable existence beneath the shade of the adobe walls, changing their position as the shadows change. The streets have a desolate and forsaken appearance. No one seemed to be at work; and such as were not squatting under the walls were engaged in gambling. The presidio buildings occupied by the military, are in a state of ruin.

Before going to camp, I rode to the quarters of the commanding officer, Colonel Medina, who had extended many civilities to Colonel Craig and a surveying party of the Commission under Mr. John Bull, the preceding year, while reconnoitering the country be-

* Escudero. Noticias Estadísticas de Chihuahua.—p. 56.

JANOS, CHIHUAHUA.

tween El Paso and the Copper Mines. The Colonel, however, was taking his siesta, and I had not the pleasure of seeing him.

We found here seven Americans, who had left one of the emigrating parties a few days previous, in the belief that they could reach California by an easier route and at less expense than by keeping with the rest. Their plan was to go to Ures, Hermosillo, and Guaymas, where they intended to take a vessel for San Francisco. On my representing to them all the difficulties that would attend a journey that way, and the delay they would be likely to meet with at Guaymas, where there might be no vessel leaving for a month, they became convinced of their error, and determined to leave the same evening, and endeavor to overtake their friends. This they could easily do, as they were on horseback, while the party they wished to rejoin were travelling with ox-teams. But they were in trouble about their animals. Two of them, having strayed away, had been recovered by the Mexicans; who refused to deliver them up, on the ground that they belonged to the party which had left. I accordingly addressed a note to Colonel Medina, stating such facts as to satisfy him of the ownership of the animals; whereupon he complied with my request, and ordered the men who held them to deliver them up forthwith.

We found an American "herb," or "Thomsonian" doctor, as they call themselves, here. He had come thus far with some of the emigrating parties for California; but finding no physician either in Janos or in the adjoining town of Correlitos, he had left his party and commenced practice on the spot. He said he had

in two weeks cleared three hundred dollars. He made his bargains beforehand, as he told us, and had just undertaken the case of a man who was to pay him \$150 if he gave him relief, and \$300 if he effected a cure. He seemed quite sanguine of getting the latter sum.

August 8. A horse died last night from the bite of a rattlesnake received three days before. We started this morning, pursuing a course south-east by east across an open and level plain about 12 miles in width, and of a desert-like character, which it assumes immediately after leaving the river. In one instance, I noticed a patch of grama grass half a mile in width, extending across the plain as far as the eye could reach. This desert, or plateau, is but little elevated above the bottom lands of the river, and is composed of a fine gravel. The bottom lands along the San Miguel are fertile, and yield abundant crops of wheat, corn, and the usual products of the country; although, at present, much of this fine soil has been suffered to run waste, on account of the hazard of cultivating it. There was formerly much stock raised here; but so completely have the Indians got possession of the vicinity, that there are not horses and cattle enough left to cultivate the soil.

The road continued excellent, and the train made good progress. On our left I noticed the course of the river winding across the plain, marked by a long line of cotton-woods. Crossing this plain, we passed around the base of some gravelly hills, and then continued in a more easterly direction over a similar plateau for ten miles, which brought us to *Correlitos*, a town standing on the eastern bank of the San Miguel, or Casas Grandes River, as it is called here.

On arriving at the river, I found, greatly to my surprise, a large and rapid stream, much swollen by the late rains, and about 100 yards in width. At first we hesitated whether to cross the stream at once, or wait till the following morning; as the people said the water would then be several inches lower, provided there was no more rain. We concluded, however, to attempt it as it was; which was fortunate for us. After some search, a fordable place was found; and notwithstanding the strength of the current, we succeeded with care in getting every thing over in safety. As a general rule, it is best always to cross a stream immediately, so as to encamp on the opposite side; for should there be a fall of rain, or an overflow of the river from other causes, it might be found impassable in the morning, and perhaps continue so for several days. Four mules which had been driven along several days with sore backs and otherwise disabled, being unfit to go further, were abandoned here.

August 9th. As a supply of fresh meat and vegetables was wanted, I determined to remain here a few hours, and after breakfast walked to the town, about a quarter of a mile distant, to see what could be had; for we were yet 160 miles from El Paso, and could procure nothing after leaving this place. I had sent to the town immediately on our arrival last evening, to engage some cattle or sheep, and was told that they would be in the corral this morning for selection; but when I called, they were still several miles off. Some men were sent after them; and in the mean time, I went to examine some large furnaces, where the silver is extracted from the ore taken from a mine in the vicinity.

Although these smelting works are a very indifferent and primitive affair, yet they are said to produce a large amount of silver, and to yield to their owner, Señor Zu-
loaga, a handsome income. The ore is taken from a mountain eighteen miles distant, and brought hither in carts to be smelted. The owner was absent; but the superintendent was very polite to us, taking us through the establishment and pointing out the several processes used in extracting the metal, as well as explaining to us the various qualities of ore.

One of the greatest difficulties which attend the smelting here is the scarcity of firewood. As there are no forests near, the roots of mezquit bushes are almost exclusively used. These roots, it is true, afford excellent fuel; but they are obtained with much labor, and the supply must sooner or later cease, as no more is produced.

Correlitos is a mud-built modern town, containing about four hundred inhabitants, who depend wholly upon the mine and smelting works for their living. There is some fine bottom land near; but little of it is cultivated. At the time of my visit, the streets were filled with mud holes, half full of putrid water, in which swine were wallowing; and the people looked sickly as well as filthy, caused by the strong fumes of arsenic which proceed from the furnaces and are disseminated through the town. These fumes were so powerful, that when the wind blew towards our camp, half a mile distant, they were quite offensive. The superintendent gave me some fine specimens of ore, as well as of the product in its various stages as it undergoes reduction.

The Apaches, I was informed, had been very bold here of late. Three weeks before our arrival a band of twenty-six had ventured within two miles of the town, where they surprised a party herding mules and cattle. They killed three men, and drove the animals off. These Indians had also, within the same period, run off a large portion of the stock of Mr. Flotte, an American living at Barranca Colorada four miles distant. No attempt at pursuit and recapture had been made.

At 11 o'clock the beeves had not come in, nor the promised vegetables; and as it would require an hour or two after the cattle arrived to kill one and distribute the meat, making it too late to leave to-day, I directed the mules, which were already hitched up and ready to move, to be unharnessed and turned out to feed. To make the most of my time, I determined to visit *Casas Grandes*, a town twenty miles to the south of us, where there were said to be extensive ruins of an aboriginal race. Hastily putting our blankets, fire-arms, and some provisions into my wagon, Dr. Webb and myself, accompanied by a Mexican servant, set out on our excursion.

I had long known of the existence of these ruins, which are spoken of by various writers on Mexico, and had made frequent inquiries about them, during the winter I spent in El Paso, of old residents there and of persons from the city of Chihuahua, without getting any satisfactory account of them. All said there were some old adobe buildings there in ruins; but whether they belonged to the present or to an earlier race of Indians, they knew not. At any rate, all agreed that they were not worth visiting.

On reaching Correlitos, I made the same inquiries, but with no better results. When I had come to the conclusion that the ruins, of which so much had been said, must have crumbled away and disappeared, a Mexican who had heard of my inquiries, and who felt some interest in the antiquities of his country, called upon me, and advised me by all means to visit the place, now that I was within so short a distance of it, assuring me that there was much there to repay my curiosity.

Following the river up in a course nearly south, we reached the village of Barranca Colorada, four miles distant, where I stopped to call on Mr. Lewis Flotte, an American gentleman long resident there, and the owner of a silver mine which is situated in the same mountain with that of Mr. Zuloaga, whose smelting works I visited at Correlitos. Mr. Flotte had gone to Chihuahua; but his mayor-domo received us politely, and showed us through his works, which are more extensive and better arranged than those at Correlitos. He had six furnaces, four of which were in full blast, while the hearths were being replaced on the others preparatory to their being lighted again. The machinery which kept the bellows in motion was propelled by mules. The superintendent took us through the establishment, describing the various processes, and gave us a set of specimens of the ores. We learnt here, as we did at Correlitos, that Mr. Flotte had been badly treated by the owner of the other mine, and that he was about to sell out his estate in consequence.

On my expressing a desire to visit this mine, which

we should pass on our way to El Paso, the superintendent gave me a note to the mayor-domo at the mine, after which we resumed our journey.

Following the river, which we crossed near Barranca, we kept down the valley about sixteen miles, when we came to a beautiful grove of large cotton-wood trees, extending from the river across the bottom to the very bank or edge of the plateau, which here rises from twenty to twenty-five feet above the valley. Passing this grove, we suddenly emerged into a broad and luxuriant valley or bottom, extending as far as the eye could reach towards the south. From the plateau, we could trace the course of the stream by the deep green foliage of the long line of cotton-woods which grow on its banks.

From the point where I stood I noticed, about a mile distant, the ruins of a large building on the verge of the plateau, near which the road passed. As we approached, several others of lesser dimensions were seen, both on the plateau and in the bottom near its base. It required but a glance at these buildings to show what they were, the first being a church, with its entire walls standing, together with a portion of its tower. Remains of tombs were also visible; but from the decayed and weather-worn appearance of the walls, the church had long been abandoned. The ruins near were those of haciendas and ranchos, some of them quite extensive; from which I inferred that the town was originally here, though it now stands two miles beyond.

As we entered the town, which bears on account of these ruins the name of *Casas Grandes*, we attracted

much attention from its quiet and retired inhabitants, who, in this remote and secluded spot, are seldom disturbed by visitors, save those who come on some errand connected with the church. Casas Grandes is not a place of business, nor is it on any great thoroughfare,

Ruins at Casas Grandes, Chihuahua.

which would enable its citizens to derive advantage from passing travellers. Its whole dependence is upon the rich and luxuriant valley, which is here about two

Ruins at Casas Grandes, Chihuahua.

miles wide, and which among Mexicans would be said to be in a high state of cultivation. This is speaking comparatively; for what in Mexico is considered

superior cultivation, would be thought very slovenly tillage in the United States.

I had letters of introduction to two gentlemen living here, which I sent on in advance by my Mexican servant, that he might find the persons to whom they were addressed, and then return and meet me. Unfortunately, both the gentlemen were absent. The man, however, had shown the letters to another gentleman, who had read them, and who requested that we should stop at his house.

We accordingly drove up to a respectable looking adobe house, where we were met by well-dressed persons, and received with much politeness. Being conducted into the house, we were scarcely seated before the room was pretty well filled with visitors, to see who the strangers were. I made myself and companion known, as well as the object of our visit; viz., to see the ruins near by, or as they called them the "Casas de Montezuma." Our host soon began to make preparations for dinner; but as it was then five o'clock, and but little time remained before dark, I requested him to defer the meal until evening, that we might make the most of our time in examining the ruins while daylight lasted.

This being arranged, Dr. Webb and myself set off for the ruins, accompanied by our host and three or four others. Being but half a mile from the village, they were soon reached, when, after a hasty walk among them, I seated myself on a small knoll, or mound, and occupied myself while there remained any light in making a sketch. The Doctor, in the mean time, was engaged in searching among them for relics. We re-

turned while we could see to find our way back through the thick mezquit chapporal, and partook of an excellent supper with such appetites as people might be supposed to have who had not eaten since sunrise. The evening was spent in questioning our friend about the ruins, and in selecting some fragments of pottery from a peck or more which the boys who had accompanied us had picked up, I having set them to work for the purpose.

The ruins of Casas Grandes, or Great Houses, face the cardinal points, and consist of fallen and erect walls, the latter varying in height from five to thirty feet, and often projecting above the heaps of others which have fallen and crumbled away. If the height were estimated from their foundations, it would be much greater, particularly of those in the central parts of the building, where the fallen walls and rubbish form a mound twenty feet above the ground. If, therefore, the highest walls now standing have their foundation on the lowest level, they have a height of from forty to fifty feet; and as these ruins have stood exposed to the elements for more than three centuries, they must originally have been much higher. Indeed the thickness of the walls, some of which are five feet at their base, would indicate that they must have been much higher than they now appear.

From a close examination of what remains of the building or buildings, I came to the conclusion that the outer portions were the lowest, and not above one story in height, while the central ones were from three to six stories. Hence the large heaps of ruined walls and rubbish in the centre, and in consequence the bet-

ter preservation and support of that portion of the edifice. By far the larger portions which have fallen are the exterior walls. This arises from the moisture of the earth and the greater exposure to rains. The central parts are in a measure protected by the accumulation of rubbish, and by the greater thickness of their walls.

I should observe that every portion of this edifice is built of adobe, or mud, and that nowhere, as far as I could trace the foundations, could I discover any walls of stone. The point in which it differs from the work of the Spaniards or modern Mexicans, is in the mode of constructing the walls. The latter employ regularly made brick, from fourteen to sixteen inches in length, about twelve in width, and three or four in thickness, often mixed with chopped straw and gravel, and baked in the sun—a mode adopted ages ago by the primitive inhabitants of Egypt, Assyria, and other Oriental countries, and practised by them at the present day. But the buildings of which I now speak are built with large blocks of mud, or what the Mexicans call *tapia*, about twenty-two inches in thickness, and three feet or more in length. In fact, the length of these blocks seemed to vary, and their precise dimensions could not be traced; which induced me to believe that some kind of a case or box was used, into which the mud was placed, and as it dried, these cases were moved along. It is true, they may have been first made in moulds or cases, and, after being dried, placed on the walls; but the irregularity and want of uniformity in these layers as to their length, leads me to believe they were made on the walls themselves.

The mud is filled with coarse gravel from the plateau, which gives greater hardness to the material. In this respect I consider it superior to the modern adobe, which is oftener made without any gravel or straw, although in the better class of buildings, I have seen both used.

In the town of El Paso there are some old division walls from three to four feet high, connected with the earliest buildings in the place, that are built of large blocks of adobe, well filled with gravel, of a similar character with those in the "Casas Grandes;" but in no buildings of the Mexicans have I seen them used. I have also seen modern fences made in the same manner of the common mud taken from the fields.

All adobe walls, whether of buildings or mere fences, decay first at their base, from the moisture; which causes them to fall over. Such is the case with the modern as well as the ancient buildings. When prostrate, the water easily permeates them; in a few years they crumble in pieces, and are reduced to the original mud and gravel from which they were made.

The outer walls of the Casas Grandes are only to be traced by long lines of rounded heaps parallel to, or at right angles with, the walls now standing; while here and there a corner of the original wall may be seen, or where it was intersected by a transverse wall which tended to support the other and bind them together. These corners often retain their erect positions long after the other portions have fallen. So with the higher and more massive walls of the interior, which are five feet in thickness at their base: the sides or longer walls have fallen, while the corners, with a

few feet on either side, still tower far above the other parts, resembling at a distance the isolated columns of a ruined temple. In so ruinous a state are these buildings, that it is extremely difficult to trace their original form. In approaching them one first meets with the low walls or embankment, which any where else would be taken for a work of nature; but the transverse heaps connecting them with the standing walls at once show them to have been similar, though of less height. A closer inspection brings to view a portion of a corner which has not fallen. As the visitor approaches the interior, where the edifice is in a better state of preservation, he becomes confused among the erect and fallen portions; for the longer sides are mostly prostrated, while the shorter ones, and those forming angles, are standing. In this dilemma I found it best to take a stand upon the highest point, which is a mound in the very centre of the erect walls, as well as the centre of the edifice. From this point, after having examined and traced the exterior portion, one may form a tolerably correct idea as to the arrangement of the edifice. It was not until I had walked several times around it and traced its inner apartments, that I could satisfy myself of its actual outline.

At first I believed that there were three separate buildings, even when I took my sketch, as there were three large heaps, apparently unconnected, each having portions of erect walls. But on closer examination, I found that they had been connected by a low range of buildings, which may have been merely courts, as they were of but one story. On the supposition, therefore, that all were connected either by low buildings or

corridors, the entire edifice must have extended from north to south at least 800 feet, and from east to west about 250. On the south side a regular and continuous wall can be traced, while the eastern and western fronts are extremely irregular, with projecting walls. There appears to have been several courts within the inclosure, of greater or less dimensions.

The general character of this extensive range of buildings is the same as that of the Casas Grandes, near the Pimo villages, on the Gila, and they are unquestionably the work of the same people. The material, too, is the same as that of the ruins on the Salinas. Like the edifice on the Gila, it is built with huge blocks of mud, laid up in the same manner, though, from some cause, probably the lesser tenacity of the adobe, the walls are in a greater state of decay. In no other way can this decay be accounted for, unless a greater antiquity is allowed for these than for the Gila edifice, which would be contrary to all preconceived opinions of them. The ruinous state of these buildings may also be attributed to the more frequent rains to which they are exposed than those on the Gila.

The walls of the present building are much decayed; in fact one half of their thickness is washed away, and it is only by digging below the surface that their original thickness can be seen. In the Gila edifice, the inner surface of the walls is as perfect as though the mason had but yesterday passed his trowel over them, and the exterior ones are but little injured. In these ruins, on the contrary, no portion of the surface is visible. I sought for this, in order to ascertain if they had been plastered inside or out; but it could only be

decided by digging to the foundation, which I had not time to do. Several portions of the walls within the area, and in particular one midway between the most southwardly building and the one to the north, had fronts precisely like that on the Gila; their doors were similarly placed, and receded towards the top, and the same circular openings were seen in the upper partition walls. So much of the walls had washed away, that I could not trace the cavities where the beams were inserted, and hence was unable, as in the Gila edifice, to ascertain the number of stories, or how the beams were laid. Not a fragment of the wood forming the beams or lintels could be discerned. Many doorways remained; but the lintels being gone, the tops had crumbled away or fallen.

Although these ruins are alluded to by many of the earlier as well as the recent writers on Mexico, I have been unable to find in any author an accurate or full description of them. I have been particularly desirous to see some early account, that I might know their appearance when first seen by the Spanish colonists, who traversed this country anterior to the year 1600. Ribas, one of the earliest writers on the aboriginal tribes, who has given the most minute details of the labors of the first missionaries, and the conversion of the several tribes of Central and Northern Mexico, says nothing of these remains, although he describes the nation that occupied the country where they are found, their manners, customs, religion, etc. I find, however, in Clavigero* a brief account, which that

* History of Mexico. 8vo. ed. vol. i. p. 151.

laborious investigator doubtless had authority for. He repeats the old story that this edifice, "agreeably to the universal tradition of these people, was built by the Mexicans in their peregrination." That it consisted of "three floors with a terrace above them, and without any entrance to the under floor. The door for entrance to the building is on the second floor, so that a scaling ladder is necessary." This would show that at some period since the settlement of the country its floors remained.

The other details in Clavigero are incorrect, and unquestionably refer to another edifice, which was built of stone, was roofed, and "surrounded by a wall seven feet thick." He also calls it a "fortress," which term cannot be applied to this structure. I am of opinion that our author either mistook the sense of the writer he obtained his information from, or has blended the descriptions of two different buildings.

Garcia Conde also states* that this edifice is known to have had "three stories and a roof, with stairs outside probably of wood," and that the same kind of structures are found at the present time among the pueblos of the independent Moquis," north of the Gila. He also repeats the story of the Aztec emigration, and that this was the third stopping-place of that people on their way from the North to the valley of Mexico.

There is a class of apartments in this edifice, the object of which I am unable to conjecture, unless they were intended as depositories for maize, beans, and other agricultural products, or in other words, a gra-

* *Ensayo Estadístico sobre el Estado de Chihuahua*, fol. p. 74.

nary. These apartments, which are arranged along one of the main walls, are twenty feet in length, by ten in breadth, connected by doorways with a small

Part of Ground Plan of the Casas Grandes, Chihuahua.

inclosure, or pen, in one corner between three and four feet high. Beside these, there are many other exceedingly narrow apartments, too contracted for dwelling-places or sleeping-rooms, with connecting doorways, and into which the light was admitted by circular apertures in the upper part of the walls. The number and extent of these long and narrow apartments, without windows, led me to believe they were used for granaries. There were also large halls; and some inclosures within the walls are so extensive, that they could never have been covered with a roof, but must have been open courts. The lesser ranges of buildings, which surrounded the principal one, may have been occupied by the people at large, whose property was deposited within the great building for safe keeping. Although there is less order in the *tout ensemble* of this great collection of buildings than in those at the north; the number of small apartments, the several stages or stories, the courts within, and some of the minor details, resemble in many respects the large edifices of the semi-civilized or Pueblo Indians of New Mexico.

The position of these buildings differs from that of those near the Gila and the Salinas. The latter were built upon the plateau or table, just above the

bottom land which their occupants had cultivated. The former stand on the declivity, with portions extending both on the plateau and on the bottom. The bank here is about twenty feet in height. Why so built I cannot imagine, unless excavations were made in the bank for store rooms. Wherever these old structures are found, they show much sagacity on the part of their builders, who must have had some object in view in adopting the plan just mentioned. As a general custom at the present day, among the Mexicans, their villages and ranchos are built upon the plateau above the valley, or cultivated bottom, and on spots where there is no vegetation, except such plants as are peculiar to the deserts. Not a blade of grass can flourish there. I supposed this to be for two reasons: first, that the valleys are sometimes overflowed, and in rainy seasons are extremely wet and damp; while on the gravelly plateau, which is hard and smooth, it is always dry. The second reason is, that being elevated, the people have a good view of their cultivated grounds, can trace their cattle and herds with ease, and discover the approach of an enemy.

On the western or upper side, some sixty to eighty yards from the building, are three mounds of loose stones, about fifteen feet high, no doubt the burial places of the chiefs or great men. I would have opened these, but had not the time or facilities for so doing. If these were burial places, and there are no indications of places of sepulture elsewhere, some valuable relics might be found beneath them.

I made particular inquiry of my Mexican friends, who were familiar with every spot of ground in this

vicinity, whether they had ever discovered the Campo Santo, or burial ground, of the builders of these edifices; but they all declared they had found none.

West of these, about two hundred feet distant on the plateau, are the remains of a building, the dimensions of which I did not take, but think it about 150 feet square. But small portions of its walls remain—enough, however, to show the nature of the building, which could not have been more than one story high. It was divided into a number of compartments, of equal dimensions, except the corner ones, and resembled some of the low buildings connected with the large edifice adjacent.

The following is an outline of the ground plan as indicated by the lines of the walls.

Ground Plan of one of the Casas Grandes, Chihuahua.

The plain for some distance south, I was told, was covered with traces of old buildings; but they were mere heaps, without a distinct form to show the nature of the original structure. In the valley they are also found.

Garcia Conde also mentions* a second class of

* Ensayo Estadístico sobre el Estado de Chihuahua, p. 75.

ruins, which are very numerous along the margin of the Casas Grandes and Janos rivers, for a length of twenty leagues and a breadth of ten. At a short distance, he says, they uniformly have the appearance of small hills or mounds, and in all that have been excavated, there have been found jars (cantaros), pitchers, ollas,* etc., of pottery, painted with white, blue, and scarlet colors; corn grinders (metates), and stone axes, but no instrument of iron.

The builders of this edifice, and the occupants of the rich valley in the vicinity, showed much sagacity in their choice of so fine a region for agricultural purposes. There is none equal to it from the low lands of Texas, near San Antonio, to the fertile valleys of California, near Los Angeles; and, with the exception of the Rio Grande, there is no river of equal size between those of Eastern Texas and the Colorado of California. The water, too, is clear and sweet, unlike the muddy waters of the Rio Grande, the Pecos, and the Colorado, which are charged with vegetable matter and earth.

Many beautiful articles of pottery have from time to time been found here, the texture of which is much superior to that made at the present day by the Mexicans. This pottery has chiefly a white or a red ground, ornamented with a variety of angular figures:

* Ollas (pronounced *oyas*) are the most common of all the utensils of pottery used by the Indians or present Mexicans. They are of various capacities, from half a pint to six gallons. Suspended by a cord over the fire they are used for cooking in, and are in universal use for carrying water. The household utensils of the poorer Mexicans consist entirely of an assortment of these useful articles.

FRAGMENTS OF ANCIENT POTTERY FROM CASAS GRANDES, CHIHUAHUA.

FRAGMENTS OF ANCIENT POTTERY FROM CASAS GRANDES, CHIHUAHUA.

those on the white ground being black, red, or brown; and on the darker material, black. I made inquiry for any relics that had been found, and was successful in obtaining a few. One of these was a small black jar; another a vessel in the form of a tortoise, of reddish pottery; and the third a beautifully sculptured stone pipe. Such relics are eagerly sought for by the people of Chihuahua and other large towns, and when perfect command a high price. I heard of many such; but they were in towns beyond my reach. I requested a friend to procure drawings of these and forward them to me, but have not yet received them, and the only addition I am able to make to those which I obtained, is a drawing from one found by Lieut. Hardy, a copy of which I give, rather to show the style of ornament than the form.* I also saw, at the house of the gentleman who was so polite to us, a fine metate taken from the ruins, about two feet in length, handsomely cut from a block of dark stone, a drawing of which I made. Similar ones are occasionally found there; and in my rambles I saw several broken ones.

The whole valley and plain for miles about these ruins is strewed with fragments of pottery. I collected a number of specimens exhibiting various patterns, in order to show the taste of the makers in ornamental

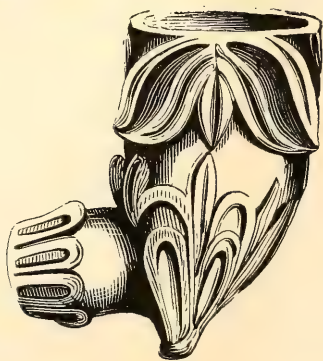

* *Hardy's Travels in the Interior of Mexico in 1825-8.* This author spent a couple of hours at these ruins, and procured the jar referred to, which he says was in excellent preservation. "There were also," continued he, "good specimens of earthen images in the Egyptian style; which are, to me at least, so perfectly uninteresting, that I was at no pains to procure any of them." p. 465.

design, as well as for the purpose of comparing them with the pottery found at the Gila and the Salinas. They will also serve for comparison with the pottery of the Moquis, Zuñis, and other Pueblo Indians, as well as with the ornaments made by the present Pimos and Coco-Maricopas. When so little remains of a people, the smallest fragments of their works of art become important. It is for this reason I have given so many specimens of their ornaments.

On the summit of the highest mountain south-west of the ruins, and about ten miles distant, there was pointed out to me an ancient fortress of stone, from which the whole country for a vast extent can be viewed. It is attributed to the same people who erected the "Casas Grandes," and was doubtless intended as a look-out. This fortress can be discerned with the naked eye, and on looking at it through my spy-glass, it showed quite distinctly. I did not visit it, as it would have required a day, which time I could not spare.

We were told that this building was a stone fortress of two or three stories, with a very solid foundation. I think that the description of Clavigero refers both to the adobe edifices I have described and to this fortress, and that the worthy historian was not aware of their being separate structures.*

* This edifice is constructed on the plan of those of New Mexico, that is, consisting of three floors, with a terrace above them, and without any entrance to the lower floor. The doorway is in the second story, so that a scaling ladder is necessary; and the inhabitants of New Mexico build in this manner, in order to be less exposed to the attacks of their enemies. No doubt the Aztecs had the same motives for raising

RELICS FOUND AT CASAS GRANDES, CHIHUAHUA.—p. 362.

The Casas Grandes River rises about a hundred miles N. W. from the city of Chihuahua, whence it flows in a course nearly north by the town and ruins of the same name, the towns of Barranca, Colorada, Correlitos, and Janos, and, after a course of $62\frac{1}{2}$ leagues, is discharged into Lake Guzman. It receives a tributary nine miles north of Janos; a second one at that town, which bears its name; and a third about ten miles below the ruins called Temeivaca. Yet notwithstanding these tributaries and the large volume of water, it often dries up, and remains only in pools barely sufficient for the population and the herds of cattle which graze upon its banks.

The valley here is about two miles in width, covered with luxuriant fields of grass, wheat, and corn. The river passing through its centre is marked by a line of gigantic cotton-woods, while in various detached spots are groups of the same. The acequias which intersect the valley in every direction, are, like the river, lined with a thick growth of shrubbery.

Beyond the valley rises the plateau, which has a gradual ascent to a low range of hills about eight miles distant; beyond which, with some miles of inter-

their edifices on this plan, as every mark of a fortress is to be observed about it, being defended on one side by a lofty mountain, and the rest of it being defended by a wall about seven feet thick; the foundations are still existing. In this fortress are stones as large as a mill-stone, to be seen: the beams of the roof are of pine, and well finished. In the centre of this vast fabric is a little mount, made on purpose, by what appears, to keep guard on, and observe the enemy. There have been some ditches found in this place, and a variety of domestic utensils, earthen pans, pots, jars, and little looking-glasses of *itzli* (obsidian):—*Clavigero's Mexico.*

vening space, rises a lofty ridge of mountains. I took two general views of the ruins, one from the west, seated on the top of the little mounds referred to, in which the whole extent of the buildings is shown, with the valley and mountains beyond. This I have shown in three parts, to exhibit them more distinctly. Two of these are wood cuts; the third, the small lithograph. The other is taken from a point near the south-eastern corner, showing portions of the walls which are not seen in the first sketch. This view is given in the large lithograph facing the title-page of this volume. As may be seen in the sketches, low mezquit bushes have taken root around the buildings, as well among its walls as in its apartments. On the west, the plateau extends to a range of low mountains, about five miles distant, running in a line from north-west to south-east. The river bottom and adjacent plateau are about fifteen miles in width, which is about the average width from Janos to Casas Grandes. Proceeding south, these mountains appear to approach, thereby contracting the plateau and valley. The latter, I was told, continues fertile far to the south, and is as highly cultivated as any portion of the country.

August 10th. From our hospitable friends we learnt that the town contained about 400 inhabitants. They are strictly an agricultural population, and have extensive fields of grain and orchards near. Maize is the chief product, and is sent in large quantities to Chihuahua and El Paso, where it finds a ready market. The people seemed industrious and happy, and were apparently in a better condition than we had found

them in the other frontier towns. They are somewhat troubled by the Apaches; and we noticed two crosses near the ruins, and four on the road to Correlitos, the evidences of their murderous propensities.

We were up by sunrise, and found a cup of coffee ready for us; after which we again set out for the ruins, accompanied by four men, whom I had engaged to dig among them.

We first dug in a large apartment where some metates had been discovered, and which it was believed had been a sort of kitchen; but we found nothing but broken pottery, an obsidian arrow-head, and some small marine shells. Leaving Dr. Webb to superintend these excavations, I set to work to take a ground plan of the buildings, as far as it was possible to do so; but the Mexicans who undertook to assist me were far from adepts in the business, and caused me much annoyance. This was not a little increased by the troops of men, women, and children, who flocked around me until it seemed that half the population had turned out, apparently with the idea that we possessed some secret information regarding buried treasures there. I was unable to complete my survey of the edifice and its numerous walls, which it would have required the labor of several men, for at least two days, to accomplish in a satisfactory manner.

At 11 o'clock, being pretty tired and hungry, we returned to the house of our friend to breakfast; after which the wagon was brought up, and we set out on our return to Correlitos, where we arrived at four o'clock, well pleased with our excursion.

CHAPTER XXXVI.

CORRELITOS TO EL PASO.

Leave Correlitos—Visit the Silver Mines of Messrs. Flotte and Zuloaga—Attempt of a peon to escape—Rio Santa Maria—Recent fight of Americans with the Apaches here—Broad open plains—Continued rain—The Salado—The Médanos, or Sand-hills—Painful night's march—Samalayuca—Arrival at El Paso del Norte.

August 18th. We left Correlitos at 8 o'clock, A.M., and took an easterly course over a plain of very gentle ascent for about fifteen miles towards a conical mountain. We then entered a defile, and soon after reached the base of the mountain, where we found water, and encamped.

In this conical mountain are the two silver mines of Señor Zuloaga and Mr. Flotte, whose smelting works we had visited at Correlitos and Barranca. As soon as the camp was arranged, I set off with several others to inspect them. The mines are on the opposite sides of a ravine or indentation, which makes up into the mountain, and their entrances are not more than a hundred yards apart. On the hill sides, around and above the entrances, are the habitations of the workmen; most of them are built of the rock excavated in mining, and from a little distance have a most singular appearance.

I first went to Mr. Flotte's mine. I presented my letter of introduction to the superintendent, a native Castilian, and was received by him with the politeness that characterizes his countrymen. After sitting a short time in his house near the entrance, we were each provided with torches; whereupon we descended the mine, following the footsteps of our guide, the superintendent himself. It was quite muddy, owing to the late rains. The shaft was between six and seven feet high, branching off in various directions. We traced it to its bottom, which was eighty varas, or about 240 feet, from the entrance. The principal vein of ore is about five inches in thickness; there is also another of one inch. Both have a dip of about 45 degrees. The entire length of the various shafts is 300 varas, or 820 feet. On returning to the house of our attentive guide, he presented us with fine specimens of the ore. We did not go further than the entrance of the other mine; as it was late, and the mine did not materially differ from the one we had examined.

August 12th. Our journey to-day was twenty-five miles. After leaving camp, our road wound for a couple of miles through the hills, and then emerged into a broad plain, interspersed at intervals of two or three miles with conical hills, from one to three hundred feet in height. Some of these were capped with a ridge or mass of stone, of a reddish color, resembling a work of art. Five miles further brought us to Walnut Creek, a small run of water, which is dry except at this season, and even then contains but little water. Half a dozen walnut trees of a small size, grow upon its banks, whence its name. After crossing this rivulet,

our course was north-east without variation, over a slightly undulating plain, covered with grama grass. A dark line of trees now showed itself far in the distance, indicating a water-course, which we reached at 5 o'clock, and which proved to be the Santa Maria. The road had been excellent since leaving Correlitos, including the mountain defile. A heavy cloud arose as we approached the stream ; and we had barely got our tents pitched and well stayed, before it burst over our heads, accompanied by a violent wind.

When a few miles from camp this morning, a man got up from behind a bush, where he appeared to have been concealed, and joined the train. He proved to be a Mexican, who wished to accompany us to El Paso. Soon after two men on horseback overtook us, and handed me a note from the superintendent of the mine, stating that one of his men had run away, and asking permission to take him in case he had joined our train. I could not, of course, interfere in the matter, and gave orders that the men should not be obstructed in arresting the runaway. The poor fellow, who was a peon, was very reluctant to return ; but his captors were armed with sabres and rifles, and all resistance was unavailing. As we journeyed on, we saw blows inflicted on the poor creature, who was, no doubt, destined to spend the remainder of his days at hard labor for the benefit of his owner. Our Mexican arrieros were anxious to liberate him ; but as we were on Mexican territory, with liberty to go whither we pleased in the performance of our official duties, interference would have been unjustifiable.

August 13th. We remained two hours longer than

usual this morning, to give the mules a chance to feed. Near us were some walls of old stone buildings, where a number of stone arrow-heads, and clippings of jasper, flint, and obsidian were found, showing that here had been a work-shop of the natives.

A few weeks previous, a party of four Americans was here surprised and surrounded by a band of some 15 or 20 Apaches. The men were armed with rifles and pistols, which enabled them to keep the savages at bay. Whenever the latter exposed themselves, the Americans gave them a shot, and killed, as they believed, several. After being thus encompassed for three days, protected in a measure from the arrows of the enemy by a little wall which they raised, and after they had all been wounded, one of their number crept out at night and made his way to Correlitos, where he applied for relief. It was granted; but they were compelled to pay \$500 for it.

I ascended a hill near our camp, from which I could trace the course of the Santa Maria, by the line of trees along its banks. A broad plain extended for many miles on either side without a tree or a shrub.

Our course continued north-east, without change, over the same level plain we had been traversing, of clay or gravel, with occasional patches of grass and a few mezquit bushes. Passed some holes of rain-water, where we stopped to water our animals. The hills and mountains, which here and there rose up from the plain, were quite picturesque, the conical and pyramidal forms prevailing with the hills; while the mountains, which were from 1500 to 2000 feet high, presented the most fantastic outlines, resembling castles, domes, and min-

arets. Some of these were of a deep red, others of a yellowish cast. There were no continuous ranges to be seen; but all were isolated, or in groups, rising abruptly and extending but a few miles.

At 3 o'clock, the usual black cloud began to rise at the south, portending rain, which warned us to make our camp before it reached us. We took advantage of a little patch of grass, where the animals might obtain a scanty meal, and stopped. Every man without exception, at once set to work; and within a very short space of time the tents were pitched, trenches dug, and the camp-fires made. Scarcely was this completed, when the storm was upon us; and but for the extra ropes and stays put to the tents, all would have been blown away. But as it was, we sat quietly within, listening to the peals of thunder, and watching the vivid flashes of lightning. We needed not to seek for a stream or a spring, for in a very few minutes the depressions in the plain around our camp furnished an ample supply, both for man and beast. We made 18 miles to-day, over an excellent road. The country around is of a most desolate character.

August 14th. Six miles from camp brought us to a hill, on which was a smooth rock covering about half an acre, to the right of the road. In this rock I counted twenty-six artificial cavities within a few feet of each other. They were from twelve to eighteen inches deep, and about six in diameter; and had been dug out by the Indians for mortars in which to pound their maize. The place was thickly covered with various kinds of cacti as well as the agave and yucca. The common prickly pear abounded with its luscious look-

ing but unwholesome fruit, of which our men partook with some caution.*

From the summit of this rocky hill, which is about three hundred feet high, we had a fine view of the vast plain around us, stretching in every direction as far as the eye could reach, and unlimited by any continuous range of mountains. Short isolated ridges rose up at intervals of from ten to twenty miles, and between them the conical hills before referred to. Immediately below, about a mile distant, was the Salado, or Salt Lake, from two to four miles across; although after rains it is doubtless much larger. Some ten or fifteen miles to the north-west, I noticed what appeared to be another small lake, which may have been the Laguna de Santa Maria. Although from its whitish appearance, it may have been but the salt bed of a dry lake.† I took a sketch of the country here, with a curious cone-shaped hill in the foreground, on the summit of which is a mass of rocks resembling a tower. Similarly crowned hills were seen during the day's march.

We made a noon halt at some pools of fresh water near the Salado; as it was my intention to go as far as possible to-day, so as to shorten the march of to-morrow, in which we did not expect to meet with any

* It is said that too much of this fruit will cause fever and ague. Whether this be true or not, I cannot say; although I do know, that on several occasions, illness was produced by a too free use of it.

† In my former journeys, we frequently saw these *playas*, or dry lakes; and even when within a quarter of a mile, it was utterly impossible to say, whether they contained water or not. On these occasions the party would be equally divided in opinion, nor could all be satisfied until we really touched them.

water. We got off again at 4 o'clock, but had not gone more than eight miles before the heavens began to be obscured by a black cloud, which rose behind a lofty pinnacled mountain on our right, one of the most singular and picturesque we had seen. Mr. Leroux rode ahead with others, to search for a patch of grass, as the plain around us was almost destitute of vegetation. Fortunately he found a small one where the hungry animals might obtain a scanty feed, a short distance in advance, where we halted. We made but fifteen miles to-day, a short march; but in this, and many other days' journeys, we were compelled to stop short of our intended places of encampment, in order to get up our tents and arrange the camp before the rain came on. I stood guard this night, and found it rather uncomfortable, as it rained most of the time; yet I made my hourly rounds, stumbling several times over mules, which I could not see in the darkness.

August 15th. Keeping a north-easterly course, our whole day's march was over a broad plain with few undulations, and no hills or mountains near; the road good as before. The day was damp and cloudy. At 4 o'clock, P. M., we stopped, having travelled about twenty miles.

We now approached the most dreaded portion of our journey since crossing the Tucson desert, south of the Gila. This was the *Médanos*, or Sand-hills. All the emigrants we had met spoke of these, and the great difficulties that attended their passage. By doubling their ox-teams, that is, by putting from 12 to 15 oxen to each wagon, they had succeeded in passing them. Two trips were thus required for each

DESERT PLAIN. VIEW FROM THE SALADO, CHIHUAHUA.

team, occupying the whole of two nights and one day to accomplish the passage, although but six miles across. Owing to the intense heat and glare of the sun on the white sand, the crossing was never attempted except at night. We were now favored by the rain; and it was thought best, notwithstanding our day's march, to make the passage of the hills this night; the weather would be cooler and the sand more compact from the rain.

The place where we stopped was about two miles from the sand hills. We accordingly dined, and let the animals feed, and at 7 o'clock, P. M., resumed our march. Upon consultation, it was thought best for Leroux to leave a couple of hours in advance of the wagons with the train of pack-mules, and go as far as *Samalayuca*, a spring two miles beyond the hills, in case he could not find water nearer. He was then to discharge his loads and return to the wagons, to give us such aid as might be necessary.

The first three miles were not very bad; for though the sand was loose, it was not deep; still it was a steady pull up a gradual ascent. As we proceeded, the sand grew deeper, and the vegetation less, until nothing but a few half-buried mezquit bushes were to be seen. An aromatic shrub was also noticed here.

At a great depth there is probably some moisture which sustains these plants; but even with this, it is remarkable how they can survive in the midst of such an intense and dry heat, in a spot where, for more than nine months in the year, there is no rain. Every thing around us had a strange wintry aspect, the white sand resembling banks of snow, from which the tops of the

bushes projected. At nine o'clock, Leroux returned to us with the pack-mules, when we stopped and unloaded the wagons, to transfer their contents to the animals' backs. It was now raining fast; and as the mules had had a tedious march over the sand hills and back, Leroux thought it best to remain where he was until day-light, while we pushed forward with the wagons, now almost empty.

Slowly and with hard tugging, we again advanced, but not noiselessly; for the incessant hooting and yelling of the teamsters, accompanied by the cracking of their huge whips, and not a few of those terrible oaths which they seem to consider it their privilege to use, made the air resound in the midst of the solitude that reigned around us. At every fifty feet it was necessary to stop, and let the tired animals breathe and get a moment's rest; then would the air resound again with the screams of the men and the lashing of the whips; then was every shoulder literally put to the wheels and the back parts of the wagons, before they could again be started. But with all this pulling and pushing, this hard swearing and beating, the poor jaded animals often stalled, and could not, with all the aid the men could give them, start the wagons an inch. The team was then doubled; and when the twelve mules had succeeded in hauling the wagon up some little rise, the descent would prove a great relief, and enable them to get forward a few rods unaided.

The reader will have an idea of the sand here, when I state that the hub of the fore wheel was only the breadth of my hand above its surface. This too, was with wagons not half filled, and at a time when

the hills are easier to pass than at any other, on account of the rain, which packs the sand, and prevents the wheels from sinking as deep as they would if it was entirely dry.

In this manner we pushed and pulled, making a gradual though slow headway, until one o'clock, when the mules refused to go further. The poor creatures held their noses to the ground, and patiently bore the beating of their cruel drivers. It was all to no purpose; further they would not go. In the five hours we had been tugging, we had not made more than four miles through the hills, and there were yet about two miles more before we should get through. There was no alternative left but to remain until morning, by which time the animals would get a few hours' rest. As my carratella (little wagon) was quite light, and my mules in good condition, I pushed forward, going myself on foot, and before four o'clock in the morning passed the hills, and reached the place where Mr. Leroux had stopped with the packs. Several of the wagons also managed to get through, leaving only three behind.

This had been one of the most tedious nights of our long journey. I was on my feet from 7 o'clock in the evening, when we entered the sand-hills, till four in the morning, making nine hours, in which time we advanced but eight miles. It rained the whole night; yet such was my fatigue, that several times, when the mules stopped to rest, or became stalled, I threw myself on the wet sand and stole a few moments' sleep.

On reaching camp, I sent back six mules, which,

with those left with the wagons, enabled them all to get through a few hours later. We did not go on to the spring talked of, which was two miles further, but stopped at some holes of rain water immediately at the foot of the hills.

The *Médanos*, or Sand-hills, are a peculiar feature in this country, stretching in a line from north-west to south-east for some twenty miles, as far as I could judge. Nearly destitute of vegetation, their light yellow or whitish appearance presents a strong contrast to the deep brown of the adjacent mountains, which form the background of the landscape. This sand is very light and fine, and forms deep ridges resembling the large waves of the ocean. When the wind blows, this sand is set in motion, filling up the former valleys, and forming new drifts or hills. The road is then entirely obliterated; not a foot-print or wagon rut being left to show its direction. The whitened bones of mules and cattle project here and there from the sand, with an occasional carcass which has dried up before the wolves discovered it. Although these hills lie on the direct road from El Paso to the city of Chihuahua, which is shorter than any other by sixty miles, it is invariably avoided by trains or loaded wagons. These take the river route, which passes entirely beyond their furthest southern extremity. Persons on horseback, pack-mules, and light pleasure wagons, alone attempt to cross the hills.

The place is also attended with danger on account of the Apaches, who well know the helpless condition of animals passing, and take the opportunity to attack parties. From Correlitos, there is no other to El Paso

for wagons; and a train loaded with corn from the Casas Grandes valley, was attacked here a year before by these savages, and all the mules driven off. The distance travelled the last twenty-four hours from beyond the Salado was twenty-eight miles, including the passage of the *Médanos*.

August 16th. All, both men and animals, were so much exhausted with fatigue, that we were compelled to lie by to-day. In the afternoon, we had the usual shower.

August 17th. Two miles brought us to the spring known as *Samalayuca*. It is a complete oasis in the desert, and consists of a small pool of water, in and around which are bushes and trees. It seems to be placed here by nature, for the weary and thirsty traveller, by whom the route would else be impassable. On the west there is not usually any water nearer than the Salado, thirty miles distant, which is also the distance of El Paso, the nearest point to the north. Eastward is San Eleazario, twenty miles.

The rain of yesterday had made the road so heavy, that I feared we should not reach El Paso as I wished. But a few hours' heat of the sun so improved its condition, that I determined to push on in advance of the train; and as we were near our journey's end for the present, I did not hesitate to force my mules to their utmost. We ascended gradually from the spring for about ten miles, when we reached the level plateau, which was as smooth and barren as any desert we had seen. About ten miles from El Paso, the road descends from the highest table to a lower terrace, and for five miles continues over broken ground with low hills and

gullies, when it strikes the bottom-land of the Rio Grande. The sight of the rich valley of this river, with its groves and forests of cotton-wood, filled my mind with the most pleasing emotions. I was again approaching civilization, at a place too where I had passed an agreeable winter, and where I had many kind friends. This long journey from the Pacific, which had occupied us for eighty-one days, was now at an end, and we should have a little rest. Soon the cultivated fields and the vineyards opened before us, and at 6 o'clock we again entered the town of El Paso del Norte. The first familiar faces we met were those of Captain Jimenes and some of the other officers of the Mexican Commission. From them we learned that Lieutenant Wilkins, the commanding officer of the U. S. troops at El Paso, and Mr. Henry Jacobs, the disbursing officer of the U. S. Commission, with a small file of troops, had been out several miles to meet us, and had just returned. They had heard of our approach by a messenger whom I despatched two days before. After some delays in fording the Rio Grande, I reached my old quarters at Magoffinsville, opposite the town, at 10 o'clock, P. M.

August 18th. The remainder of the party were unable to get through last night, and came in this morning.

Of this journey, now concluded, which embraced about eleven hundred miles, about one half was performed while the thermometer ranged above 100° during the day, and the other half when there was scarcely a day without a heavy rain. To Lieutenant Whipple, the chief engineer and astronomer in charge

of the survey of the Gila, and his several assistants, the government and the country cannot award too much praise for its successful accomplishment under such privations, and hardships, together with so many and such serious difficulties.

As regards the health of the party on this journey from California, it was generally good. A few cases of scurvy occurred among the escort ; and during the last two weeks before reaching El Paso, many began to be afflicted with rheumatism, and fever and ague, from their constant exposure for thirty-four days to rains. There were also some cases of bowel complaints from time to time ; but all readily yielded to medicine. One most painful casualty it was our lot to meet with, in the death of the excellent officer and friend who commanded our escort, Colonel Lewis S. Craig.

SIXTH DIVISION.

EL PASO TO THE GULF OF MEXICO.

CHAPTER XXXVII.

INCIDENTS AT EL PASO DEL NORTE.

Preparation for completing the Survey of the Southern Boundary of New Mexico—Withdrawal of the military from El Paso—Importance of El Paso as a military post—Its business—Encroachments of the Apaches—Depredations of the Comanches—Suggestions for a better protection of the frontier—Colonel Langberg—Visit to Fort Fillmore—The Mesilla valley—Visit to the Organ Mountains—Silver mine—Grand scenery—Return—Bracito and its battle-field—Preparations for leaving El Paso—Mail party attacked by the Comanches—Decide to go by way of Chihuahua—Laxity of the Mexican Custom House—Departure of Lieutenant Whipple and party for the Gila—Organization of parties.

THE first step now to be taken was to close up all the business of the Commission, and to prepare for joining the surveying parties on the lower Rio Grande. I had advices here from Major Emory, the principal Surveyor of the Commission, advising me of the progress made on that portion of the line. Two parties had been actively engaged in the work; and Major E. believed the survey would be completed as far as Loredó by

October, and the whole line to the mouth of the river by the 4th of March, 1853, if no unforeseen obstacle was placed in the way.

There yet remained to be completed that portion of the line on the parallel of $32^{\circ} 22'$ north latitude, which was to extend west three degrees from the Rio Grande, and thence north to the Gila. Of this line Lieutenant Whipple, while acting as chief astronomer, had surveyed and laid down with great minuteness about one half, and had also determined and marked its western termination. I now directed the same officer to organize a party, and as soon as the train could be got ready to take the field again, to resume and complete the survey of the line referred to, in the same manner in which he had begun it.

The next step was to prepare for the return of myself and party, to rejoin Major Emory at Eagle Pass (Fort Duncan). More wagons had to be procured for Lieutenant Whipple as well as for myself; and all those that had come through from California required more or less repairs. The harness, tents, and camp equipage too required a thorough overhauling; as the continued wet weather and constant marching had told severely on every thing. I was so fortunate as to find mechanics here, who were at once employed and set to work. In the mean time the mules had to be brought to a condition fit to undertake as long a journey as that they had just completed. They were, therefore, given rations of corn and sent to the mountain near, where there was grama grass in abundance. But they had become so thin, that many weeks would be necessary, under the best care, to bring them up.

I was sorry to find on my arrival, that the military post, which was here when I left the year before, had been broken up and the troops withdrawn, with the exception only of a small detachment under Lieutenant Wilkins, which was quartered at Mr. Magoffin's rancho, in the same building where I was. To the regret of all the inhabitants, even this small force was withdrawn a few weeks after.*

Military Post, El Paso.

* The town of El Paso del Norte, so frequently alluded to, is on the Mexican side of the river. On the American side there was no settlement until after the war, and the rich bottoms were but partially cultivated or suffered to run to waste. At present, there are three settlements here, viz., Mr. Coon's ranch with its adjoining buildings, which was formerly the military post; Mr. Stevenson's ranch, with another group of buildings; and Magoffinsville. This last is now the principal

The Apaches had been more bold than usual during the spring and summer of 1852; and the whole frontier had suffered from their inroads. Many men had been killed within a few miles of El Paso; and at the astronomical observatory, at Frontera, eight miles distant, a man was pierced with arrows while herding the animals within a few rods of the house. Mr. Magoffin's corral had been several times entered, and his mules stolen; and many other citizens there had been sufferers. On two occasions, while I remained at Magoffinsville, the Indians made attempts to run off the animals of the Commission, but were frustrated, by being discovered in time to prevent the stampede. No one could venture alone, with safety, three miles from the settlement, and when I went to take a ride, if it was extended as far as three miles, I felt it necessary to be accompanied by several friends. Such was the state of the Mexican frontier in 1852.

As the question has been repeatedly asked, What is to be done with the large tribes of Indians on the Mexican frontier? and as there is still a diversity of opinion on the subject, I shall take the present occasion to make a few suggestions, based upon what I

settlement, and represents the American El Paso. It consists of a large square, around which are substantial adobe buildings of a better description than usual, embracing some six or eight large stores and warehouses, well filled with merchandise. This town is admirably situated, and belongs wholly to James W. Magoffin, Esq., an American, long resident in Mexico, whose energy and public spirit will undoubtedly make it the principal place on the frontier. Its position, as astronomically determined by Lt. Whipple, is, Latitude North, $31^{\circ} 46' 05'' 5$. Longitude West from Greenwich, $7^{\circ} 5' 24''$. Distance due South to the centre of the channel of the Rio Grande, 2,226 feet.

have learned from personal observation, and my intercourse with the Indians.

It is known that we already have along this frontier, but chiefly in the State of Texas and the territory of New Mexico, a large military force, embracing full two-thirds of the army, which is supported at an enormous expense. Military posts have been established at various points on the Rio Grande, and in the very heart of the Indian country, in Texas, and New-Mexico. Yet two of the largest and most widely spread tribes, the Comanches and the Apaches, are as actively hostile to the Americans and the Mexicans as they were before the country occupied by them, became a part of the Union. At no period have the incursions been more frequent, or attended with greater atrocities, than at the present time. The Comanches pass across the Rio Grande into Mexico, in bands of 300 or 400, and penetrate the very heart of Chihuahua; they have passed into Durango and Zacatecas, and have traversed Coahuila and Nueva Leon. The extent of the depredations and murders committed by them would be appalling, if summed up.* Yet the system flourishes in full vigor, notwithstanding the efforts made to suppress it on the part of the United States, in compliance with the solemn stipulations of the Treaty with Mexico.

The depredations of the Apaches are less serious, only because their numbers are less, and they have a more thinly settled country for their operations. In

* Some idea of the extent to which this predatory warfare is carried on, can be formed from the following report of the amount of stock stolen by the Indians in the territory of New Mexico, from the 1st of August,

Mexico these are confined to the northern portions of the States of Sonora and Chihuahua. These regions, once inhabited by a peaceful and happy population, are now deserted, and the fertile valleys they tilled are reverting to the condition of a wilderness.

The numbers of both these tribes have been, in my opinion, much overrated. That of the Comanches, from the most reliable information I could obtain, falls short of 12,000. Their range is from the Mexican States alluded to, to the Buffalo region, north and east of Santa Fé. In the fall and winter season their home is near the Rio Grande, in the *Bolson de Mapimi*, a vast basin shut in by high mountains at the west. Here they enjoy uninterrupted possession of a wide extent of country, whence they make their sallies into the heart of Mexico. The Apaches, whose number does not exceed 5000,* extend from the vicinity of the Pecos through the States of Chihuahua, Sonora,

1846, to the 1st of October, 1850, as taken by the Assistant-Marshals of the United States :

Counties.	Sheep.	Mules.	Horses.	Horned Cattle.
Santa Fé	16,260	570	267	894
Taos	17,080	1,032	1,764	5,600
Rio Arriba	43,580	1,960	658	2,382
San Miguel	50,000	7,000	3,000	21,000
Santa Aña and } Bernardo }	154,915	749	987	1,302
Valencia	171,558	376	372	1,463
Total,	453,293	12,887	7,050	31,581

* It is no easy matter to form a correct estimate of the number of Indians in a tribe, unless they are actually counted. This is evident from the varying reports of different agents and travellers. In the tables of the Indian population of the United States, in Mr. Schoolcraft's great

and the territory of New Mexico, to the confines of the Colorado of the West. They are less nomadic in their habits than the Comanches, and have districts in which their families permanently reside.

This tribe, from the time they are first mentioned by Father Kino, in the year 1694, have been a nation of robbers. Their hand is against every other tribe, and that of all others against them. It was they who drove out the peaceable people and semi-civilized tribes from the Gila, and destroyed the builders of the ancient edifices we have spoken of. Every account we have represents them as a treacherous and blood-thirsty people, living by plunder alone. They have made repeated treaties with the States of Sonora and Chihuahua, only to be broken on the first favorable opportunity; and the treaties recently made with the United States have been as little regarded.

I proposed to the principal chiefs that they should abandon cattle-stealing, and cultivate the ground; telling them if they would do so, the U. S. government would instruct and protect them, giving them blankets and clothing besides. The old chiefs said they could not adopt this new fashion, although the boys and

work, the Comanches are variously set down, from the year 1846 to 1850, at from 12,000 to 20,000. The Apaches embrace so many bands, and are so widely scattered, that it is extremely difficult to enumerate them. Mr. Schoolcraft, from the latest authorities, puts the Apache bands in Texas at 3500 in New Mexico at 6000, and in the unexplored parts north of the Gila at 2000, making altogether 11,500; which I think too high. It is unusual to find 200 of them together; and throughout the States of Sonora and Chihuahua, I heard of the same chiefs that we met and with whom we kept up so long an intercourse at the Copper Mines, and who were, of course, accompanied by the same bands.

young men might do so. They said they would not rob or murder the Americans, but could not be brought to promise the same with regard to the Mexicans.

What, then, is absolutely necessary, for the sake of these Indians themselves as well as of our frontier population, is to convince them of the overwhelming superiority of force on our side; and to show them that, if they wish to escape utter extermination, they must lay aside their predatory habits, and learn to live by the labor of their own hands.

To effect this, a change should be made in the system pursued at the frontier posts. Soldiers should not go into quarters, and then quietly remain devoting themselves to agriculture. Better would it be for the government to pay double the price it now does for its wheat and corn, than to employ the soldiers in cultivating it; for the consequence of the present system is, that by their attending to the fields, they become unfitted for and neglect their proper duty as soldiers.

I would suggest, that with the opening of the spring, the soldiers should leave their quarters, and be kept moving from one point to another. Let them be a few days in a mountain pass, next at some oasis in the desert whither the savage must resort to satisfy his parching thirst, and again in some of those beautiful valleys covered with luxuriant grass, which are also his resort after his predatory excursions, that he may recruit his animals. This active life would be much more agreeable and healthy for the men than the inactivity of a garrison, and would tend more to overawe and subdue the Indians.

A difficulty arises when the Indians, on being pursued, take refuge in Mexico, where our troops cannot follow them. Some arrangement should be entered into by which small bodies of U. S. soldiers may be permitted, on such occasions, to enter Mexican territory within prescribed limits. This plan would be agreeable to the Mexican authorities, as they informed me.

I have no doubt that much might yet be accomplished by sending suitable agents among the Indians; men who are at heart philanthropists, and who will earnestly engage in the work of ameliorating their condition. Much good could be done, too, by sending mechanics among them, particularly carpenters and blacksmiths, also a supply of implements of husbandry. Most of the tribes beyond the Rio Grande are more or less agriculturists; and an attempt should be made to bring the wild Apaches and Comanches into the same condition. The pursuit most immediately adapted to their nature and habits would be the raising of cattle and mules; a business which they could most profitably pursue, and which they fully understand already. The rising generation could be advanced a step further, and taught the first principles of agriculture.

A plan has been proposed in California to drive all the tribes of that country to New Mexico. This is wrong; and the project ought not, for a moment, to be entertained. As a writer on the subject remarks, it would be "turning New Mexico into an area for the mutual extermination of the Indians, or else driving a portion of them from their old homes to join the

predatory bands which are now desolating that country. The policy of concentration is a pernicious one, and can have but one result: it will stimulate their fondness for war, and render necessary an armed and an annihilating protection to our citizens. Besides this, there is but little game in that country, and the arable lands could not support such numbers as would be brought into it if the plan should be carried out.

The only excursion I was able to make, while waiting for the train to be got ready, was to Fort Fillmore. Towards the close of September, Colonel Langberg of the Mexican army, and military inspector of the frontier, proposed to me to visit Colonel Miles, commanding at that Fort; I gladly took advantage of the opportunity.

On the day appointed I took my carriage, and, accompanied by Colonel Langberg, Dr. Webb, Mr. H. Jacobs, and ten dragoons, set off for Fort Fillmore, about 45 miles distant from El Paso; which we reached at sunset, and where we were politely received by Colonel Miles and the officers with him.

This Fort was established in 1851, when the military posts at Doña Ana and El Paso were abandoned; as it was thought that its position was better than either of those, and that it would be sufficient for this frontier. It contained at the time of our visit about two hundred soldiers, infantry and dragoons, under the command of Colonel Miles of the 3d Infantry. It occupied a commanding position above the bottom-lands; whence the valley of the Rio Grande can be seen for many miles. Nearly opposite is the town of Mesilla: and extending above and

below it, is that portion of the bottom-lands known as the "Mesilla Valley,"* which is now occupying the public attention, as connected with the boundary dis-

* Mesilla is the derivative of the Spanish *mesa*, table; and, as here applied, means a small plateau, or table-land, to distinguish it from the great table-land which extends for many hundred miles on both sides of the Rio Grande, and which is not susceptible of cultivation. It was without an inhabitant until the year 1850.

At the close of the war with Mexico, the majority of the inhabitants of Doña Ana determined to leave that place, in consequence of the encroachments of the Americans, who endeavoured to despoil them of their property. Whether the Mexican occupants of the town and lands adjacent were the lawful owners or not, it is needless to inquire; it is sufficient to say that they had long been in undisturbed possession.

With this resolution, a spot was selected on the opposite or western side of the river, eight or ten miles below Doña Ana, which, it was believed, would be within the limits of Mexico. In the month of May, 1850, this people established themselves there, and named the place "La Mesilla." To increase the colony, the government of Mexico offered to give lands to other actual-settlers; which offer induced large numbers of dissatisfied Mexicans living in New Mexico and in the small settlements along the Rio Grande, in Texas, to remove thither. More than half the population of Doña Ana removed to Mesilla within a year.

When the boundary line was agreed upon, in December, 1850, and it became certain that La Mesilla was south of it, the fears they had begun to entertain were removed, and a day was set apart for public rejoicing. After this, the population increased much on account of the inducements offered; and in October, 1852, the Prefect of El Paso stated that it numbered 1,900 souls.

Very few Americans settled there—in fact, none but traders; and it is probable there never were twenty altogether.

Last summer (1853) some speculators attempted the same impositions as were practised when they were citizens of New Mexico, by claiming their lands. This created such dissatisfaction, that they threatened to leave, and again become citizens of the United States. At this

pute. The town of Cruces is about three, and Doña Ana about eleven miles further up the valley. The bottomlands are exceedingly fertile on both banks of the river; and I am not aware that they are better situated or more productive on one bank than on the other. The barracks at Fort Fillmore are as yet quite rude, being mere *jackals*, that is, built of upright sticks filled in with mud. They were hastily put up; but it is the intention of Colonel Miles to have more substantial buildings of adobe erected forthwith. There is no better material in this country for buildings than this.

I took the opportunity while at Fort Fillmore to visit a silver mine, which had been discovered a few months previous, and which was now being worked by its owner, Hugh Stevenson, Esq., of El Paso. The mine is situated in the Organ Mountains, about eighteen miles east of the Fort; and as these mountains are the haunts of the Apaches, Colonel Miles kindly furnished us with an escort of ten dragoons, commanded by Major Steen, an officer familiar with this region, and experienced in Indian campaigns.

By taking an early start we reached the nearest point in the mountains, about twelve miles distant, before 10 o'clock, having traversed a desert plain with a gradual ascent the whole way. On reaching a defile which leads across the ridge. Major Steen and Dr. Webb took a portion of the dragoons and went to the

time some mischievous persons put the idea into their heads of saving their property by denying the jurisdiction of Mexico; and this is doubtless the foundation of the statement that they desire to be annexed to the United States.

mine, which was about five miles farther to the north, while I remained with the rest to examine the defile. I then took my rifle, and walked a couple of miles through it and the deep gorges which indent the ridge. In this ramble I passed a beautiful little stream, which, rising far within the defile, wound its way along through

Organ Mountains.

many intricacies, where it had worn for itself a deep bed, until it tumbled over the rocks in a single fall of some fifty feet. Although the quantity of water was small, the fall was exceedingly picturesque. When far up in this mountain, whither I was led with some of

the dragoons in pursuit of a deer, we saw fresh Indian tracks; and not knowing but an arrow or a lance might be thrown at us from behind some rock or bush, we thought it best to return.

The "Sierra de los Organos," or Organ Mountains, are so named from their pinnacled summits and sides, which resemble the pipes of an organ. They are of a light gray granite, and rise to the height of 3000 feet above the river. The range runs north and south, and joins the El Paso Mountains, not far from the town of that name. The defiles are filled with large pines, and the more open valley, with live-oaks. Pine timber is here cut and drawn by mules to where it can be reached with wagons.

From the place where we halted and lunched, I took a sketch of these mountains and of the defile through which I had passed. A small stream flowed near us, marked by a line of fine large oaks. Midway between this spot and the mountains rises a bold mass of white granite.

In the afternoon Major Steen and Dr. Webb returned from the silver mine, bringing specimens of the ore. We then harnessed and saddled up for our return to the Fort, which we reached at nine o'clock.

We passed a few days very agreeably at Fort Fillmore, partaking of the hospitalities of Colonel Miles and his officers. This visit, too, was rendered doubly agreeable, by the society of four American ladies, belonging to the families of the officers, who had had the courage to accompany the army on its toilsome march of three months across the plains. These were the only American ladies I had met between San Antonio

and the Pacific coast, and were, I believe, the only ones on this portion of the frontier.

On our return we made a noon halt on the banks of the river, near the spot where the gallant Doniphan won his first laurels, the battle-field of Bracito. Although this place is laid down on the maps, there is no town nor even a single habitation to mark the spot. The battle was fought on an open plain, the very last place one would expect the Mexicans to choose for meeting an invading army, unless confident, as it appears they were, of overwhelming them at once. Had the Mexicans taken a stand in the mountain pass, they might have given some trouble; but even then they could only have retarded a little the progress of the conquerors.*

* I quote from Colonel Doniphan's despatch a brief account of this affair:—"On the 23d of March, we commenced our march from Doña Ana; and on the 25th, our advance of 500 men had halted for the purpose of camping, about three o'clock. Our men were engaged in getting wood and water, when our advanced guard informed us the enemy was rapidly advancing at a short distance. The rear, under Colonel Jackson, was several miles behind; the rally was immediately sounded, and our forces formed in open order on foot as skirmishers. The enemy halted at half a mile, and formed in line of battle. Before we had fully formed, they sent a lieutenant near our lines with a *black flag*, with a demand that the commander of our forces should go to their lines and confer with their commander; declaring, at the same time, unless it was complied with, they would charge *and take him*, and *neither ask nor give quarter*. The reply was more abrupt than decorous—"To charge, and be d—d." At the return of the *black flag*, the enemy commenced his charge, and opened a fire on us from right to left, at about 400 yards. Our forces were ordered to receive their fire without returning it, until it could prove effective. Three rounds were fired by the whole line, before they had advanced within rifle shot. I then ordered their fire to be returned. This

It had been my intention, when leaving El Paso, to take the San Antonio road as far as the Leona station, about six hundred miles, and there turn off to Eagle Pass, where I expected to meet Major Emory; and for this journey all my arrangements were made. The military escort was alone wanting, and this was one object of my visit to Fort Fillmore, where a portion of the company originally detailed for the purpose were waiting orders. Much to my disappointment I found there but twenty-four effective men belonging to the company, a number barely sufficient for an escort for Lieutenant Whipple.

In this position, I was at a loss what course to take, or how to get out of the country. Every small party coming through from San Antonio had been attacked by the Comanches; and accounts had reached El Paso that bands of three hundred warriors had been seen. At no time had there been so much alarm felt; and I was advised, by the army officers and others, who knew the state of the country, not to attempt the journey, with so small a party as mine, without an escort. The officers and men of the Commission, myself included, had performed guard duty from the Pimo villages to El Paso; and we did not feel disposed to do it again on the long march to Eagle Pass. At this juncture

was done from right to left, along the whole line simultaneously, which completely checked their advance, and threw them into great disorder. A charge was now made, when the enemy fled to the mountains contiguous. The force of the enemy was 1220, of which 537 were cavalry. * * * The loss of the enemy was 43 killed, and 150 reported at El Paso to be wounded. Our loss was none killed—7 wounded; all since recovered.”

Colonel Langberg kindly tendered me an escort of Mexican soldiers, in case I would take the route by the city of Chihuahua, and thence through the States of Durango, Coahuila, Nueva Leon, and Tamaulipas, to such point as I wished to reach on the Lower Rio Grande. This offer, after due consideration, I accepted, and advised Major Emory of my decision, requesting him to meet me at a point lower down the river than Eagle Pass, which would probably be Comargo.

About this time the mail party from San Antonio arrived. They had been attacked and surrounded by a large body of Indians; but had kept their assailants at bay for several days, by entrenching themselves behind some rocks. This party consisted of men celebrated as Indian fighters, and was commanded by Mr. Wallace, one of the most intrepid and experienced men on the frontier. Every Indian who exposed himself was instantly brought down by a shot from the unerring rifle, until they were actually driven from the field. Mr. Wallace returned to San Antonio, procured a new outfit, and strengthened his party; he then set out again, and came through with the mail in safety.

During my stay here, one of those events took place which are not unusual on the Mexican frontier, and which sometimes produce a rupture between the Mexican government and its people.

It is known that the duty of sixty per cent. imposed by Mexico on many articles of merchandise, amounts to a prohibition. Yet, owing to the laxity of the custom-house officials, the law has been evaded, and goods regularly admitted at a mere nominal rate. Each collector knows that if he exacts the legal duty, either the

merchandise will be smuggled in, or some brother-collector, less conscientious and more anxious to pocket the fees, will be ready to compound for a smaller sum. It accordingly became the practice to admit trains of merchandise for the interior of Mexico by paying five hundred dollars on each wagon load. This free and easy way of doing business had certainly the advantage of saving clerk hire, as well as removing the necessity of examining invoices, and all contention as to the cost or value of goods.

A leading merchant of the city of Chihuahua, who for some reason had become inimical to the government, had a train of some sixty or seventy wagons and carts filled with goods, on its way from San Antonio to that city, by the way of the Presidio del Norte. The authorities, being informed of the approach of the train, were determined that it should not pass without a thorough examination and payment of the full duties; to insure which, a military force was sent to the crossing place. In consequence of this unlooked-for obstacle, the whole train came up to El Paso, about two hundred miles out of its way, for the purpose of entering here; but the military force, which was under the command of Colonel Langberg, was ordered hither also, to prevent the entry of the goods except at the full duty. The collector of El Paso was disposed to pass the goods after the usual convenient fashion, in which he was supported by the merchants and municipal authorities of the place; while Colonel Langberg, acting under orders from the capital, was determined that they should not, and declared his intention to arrest and imprison the collector, Don Alejo Garcia Condé,

if he did not strictly enforce the legal duties. The collector armed himself and his party, and the train prepared to cross and fight their way through. As might be supposed, there was great excitement, and it was feared blood would be shed; but the affair passed off quietly. The train crossed the river, each teamster armed with a whip and rifle; and to avoid a conflict, Colonel Langberg sent an armed guard with the train to Chihuahua, which was followed by the collector, to settle the difficulty there.

On the 1st of October, Lieutenant Whipple took his departure, to complete the survey of the line forming the southern boundary of New Mexico, before referred to.

LIEUT. A. W. WHIPPLE,	<i>Corps Top. Eng., Astronomer in Command.</i>
HUGH CAMPBELL,	<i>First Assistant.</i>
FRANK WHEATON,	<i>Assistant and Topographer.</i>
WILLIAM WHITE, JR.,	<i>Assistant.</i>
GEORGE G. GARNER,	<i>Do.</i>

These, with sixteen men as instrument carriers, mechanics, laborers, teamsters, servants, arrieros, etc., made the party. He had also a military escort of twenty-four men. They were all mounted, save the soldiers; while both wagons and pack-mules furnished the necessary transportation.

My own party, then about to leave, comprised,—

DR. THOMAS H. WEBB,	<i>Sec. of the Joint Commission and Surgeon.</i>
HENRY JACOBS,	<i>Assistant Secretary and Disbursing Agent.</i>
GEORGE THURBER,	<i>Acting Quarter-Master and Commissary, and Botanist.</i>
HENRY C. PRATT,	<i>Draughtsman and Artist.</i>

The following gentlemen, belonging to the engineer corps, accompanied me, to join Major Emory and enter upon their duties on the lower Rio Grande.

CHARLES RADZIMINSKI, *Principal Assistant Surveyor.*

MALCOLM SEATON, *Assistant Do.*

HENRY C. FORCE, *Do. Do.*

JOHN J. PRATT, *of Lieut. Whipple's party, returning on account of ill health.*

WM. FERGUSON, *Carpenter.*

Six teamsters, one carriage driver, and six men as servants, cooks, laborers, and herdsmen.

CHAPTER XXXVIII.

EL PASO TO CHIHUAHUA.

Departure from El Paso—Accident at the start—Farewell to friends—San Eleazario—Fording the Rio Grande—Wagon upset—Guadalupe—Ascend the Table-land—Grassy plains and open country—Ojo de Lucero—Laguna de los Patos—Country overflowed—Wagon mired—More accidents—Carrizal—Ojo Caliente—Rio Carmen—Encounter with the Apaches—A man killed—Animals lost—Ojo de Callejo—Mexican soldiers—Precautions to avoid a surprise—Laguna de Encinillas—El Peñol—El Sauz—Rio Sacramento—Battle field—Notice of the battle—Arrival at Chihuahua.

October 6th. All being in readiness to start, the train drew up in front of Mr. Magoffin's store-house, to take in a supply of corn. While standing here, the mules, which had not been in harness for six weeks or more, became uneasy, and, turning suddenly round, broke off two of the wagon tongues; which compelled us to wait another day for repairs.

There is no grass along the river after leaving Isleta. This made it necessary to send off a wagon load of corn, to be delivered to us about eighty miles ahead. In addition to this, each team carried a few bags.

October 7th. The broken tongues being replaced, the train moved off in the afternoon, in charge of Mr. George Thurber, intending to go as far as Isleta, 12 miles distant.

October 8th. The day had now arrived when I was to take leave of my friends at El Paso. Friends at home, where we have numbers, are not always valued as they should be; but in a country like this, on the borders of civilization, one knows how to appreciate them. I had now been here seven weeks, and during the winter of 1850-51, five months, while waiting the arrival of the chief astronomer. With many gentlemen here, particularly J. W. Magoffin, Esq., I had transacted business to a large extent, and in a manner which to me, as an agent of the government, was highly satisfactory. To them I take this occasion to express my sincere thanks for the promptness with which they fulfilled my orders, often to their own inconvenience, and for their uniform readiness in accepting my drafts upon the government, when a contrary course would have been detrimental to the public service, and would have subjected me personally to serious embarrassments.

On the occasion of our departure, Mr. Magoffin invited a number of gentlemen to partake of a cold collation, which proved to be one that would have done credit to the caterer of a metropolitan hotel. Although it is difficult at times to procure a piece of fresh meat at El Paso, the delicacies prepared in New York and Paris for foreign markets can always be found here in abundance, though at a high cost.

I left at one o'clock, and in the evening joined the

train at San Eleazario,* where I passed my first night in camp.

October 9th. The reloading of some of the wagons detained us here several hours, and my troubles with the men began. My cook took the opportunity to get drunk during the night, and for his bad conduct was put in the calaboose. By the aid of my friends here I was enabled to find a good substitute, and we soon after took up our march. The train consisted of my travelling carriage, a very convenient vehicle, which was to form my sleeping-place during the journey; the small wagon I brought from California, in which Dr. Webb rode; and six other wagons containing our provisions, baggage, tents, camp equipage, instruments, etc. All the party were mounted on horses or mules, and well armed; and for a change I had also provided myself with a riding mule. We got off at noon and made fourteen miles, encamping near a pool of water. Our route, most of the way, was along the Rio Grande, over a rich bottom, of which only a small portion was under cultivation.

October 10th. I rode on in advance with several others to examine the crossing, as it was necessary to ford the Rio Grande here. To my surprise I found the banks very precipitous; and as the river was here much contracted, it was proportionably deep and rapid. With considerable difficulty and some risk I crossed in my carriage; and then, seeing the danger that would

* This name is also spelt *San Elceario*, which is, I believe, the original and correct mode. But as it is invariably pronounced *Eleazario*, and so written, by the people, I have adopted that orthography.

attend the wagons, both in descending and ascending the steep banks, as well as in crossing the river, I hired a Mexican to take a note back to Mr. Thurber, who was with the train, advising him to send men forward with spades and pickaxes, to cut down the banks before the wagons should attempt to pass. I then rode on to Guadalupe, three miles ahead, for the purpose of procuring sheep, as well as to notify the Mexican escort, who were to join us here, of the approach of the train.

Colonel Langberg had promised me ten men, if I could wait a few days for their return from Chihuahua; but this I could not do, and was therefore obliged to take up with five, as but few now remained in the garrison. These men soon reported themselves.

After procuring the sheep, and while we were quietly waiting for the train to come up, a messenger arrived with the disagreeable news that the ambulance which contained the personal baggage of Dr. Webb, Mr. Jacobs, and myself, had been upset in crossing the river, and that every thing had been immersed in the water. I hastened back to the scene of the disaster, and found things worse than I had expected. Besides our baggage, a trunk filled with papers, maps, my account books, and the official records of the Joint Commission, had been wet. Some choice stationery was utterly ruined.

We at once set to work, and spread every thing out on the patches of grass that were near and on the branches of trees; but although the sun was hot, there was not sufficient time to dry all before night.

October 11th. The forenoon was spent in drying our effects and packing them away again. At noon the

animals were again hitched up, and we moved off once more, passing through Guadalupe, and stopped at a small lagoon, three miles beyond, where we encamped. We could have travelled a couple of hours longer, but were told there was no water within fifteen miles, which we could not make before dark, as a portion of the road was very sandy.

Guadalupe is a miserable looking village. It was founded in the year 1850, as a military colony, at a time when the Mexican government offered inducements to settlers to take up lands. Its population consists chiefly of persons from New Mexico, who preferred Mexican to American rule. Its houses are all built of upright sticks, the interstices filled with mud. There was but one shop in the place, and no mechanic except a blacksmith. There was nothing that indicated prosperity; and the contrast between this village and a new American settlement, was most striking. We looked about for vegetables in vain: a few water-melons were all the place afforded.

October 12th. Last night was very cold, so much so that three or four blankets were necessary. During the day the heat is quite oppressive, so that the thinnest clothing is required; but no sooner does the sun sink below the horizon, than the temperature falls to a degree that compels one to change one's garments and wrap up well in blankets. The mornings are equally cold, until the sun has been up at least three hours. By ten or eleven thick clothing is laid aside.

We left the valley of the Rio Grande to-day, and ascended the table-land, which was thinly covered with chapporal without grass. The road was sandy;

yet we made fifteen miles, and encamped at *Cantarecio*, where there is a spring of good water.

October 13th. Our course was to-day south-west towards the direct route from El Paso to Chihuahua; and with the exception of a few places, the road was good. Mezquit grass occurred at intervals sufficient for grazing. No trees were seen, and scarcely any shrubbery; so that our cooks with difficulty procured enough to prepare our food. We made twenty-five miles (at least so it was called by the Mexicans), and encamped at *Charco de Grado*. The Mexican mode of measurement is very uncertain, unless practised by engineers. The water here is found in small pools, supplied by springs; but so meagre is the supply, that I doubt whether it can be depended upon in the dry season.

October 14th. Our course continued the same as yesterday, over a broad plain, unlimited by mountains, which showed themselves only at intervals of from ten to twenty miles in short ridges, their summits presenting a jagged and fantastic appearance. Turrets and cupolas, huge towers and castles, alternately were seen. These mountains appeared to be destitute of vegetation, except the grama grass, which grows on the debris from the base to the point where the bare rocks arise.

Fifteen miles brought us to the *Ojo de Lucero* (Venus's Spring), which furnishes but a small supply of water. We did not stop here, but pushed on to the *Laguna de los Patos* (Duck Lake), six miles further, and encamped near a spot where a stream of clear and delicious water crosses the road. This rivulet comes from a spring near by, and empties into a small

pond containing a couple of acres, in which many ducks were seen.

Two miles before encamping, we entered the direct road from El Paso to Chihuahua. This road crosses the *Medanos* or Sand-hills, which we passed on our road from Correlitos to El Paso; and such were the difficulties then presented, that I determined not to attempt it again with wagons. Our route by Guadalupe required two days longer than if we had crossed the Sand-hills; but it was better to lose two days than to disable or break down our animals at the outset of a long journey.

The Laguna de los Patos is the outlet of the river Carmen; and is four or five miles across, varying in extent according to the rainy season. The body of water on our right was doubtless the effect of the late heavy rains; while that on the left, which is properly the laguna, is permanent.

A mile before reaching the lake is a small hill some twenty feet high, on the top of which is a warm spring. In the plain on our right, which was more or less covered with water, at a distance of eight or ten miles, I had noticed during the day what I supposed to be clouds of dust or whirlwinds; but I afterwards learned from our Mexicans that it was steam from hot springs. The steam sometimes issued forth in jets, rising from fifty to one hundred feet high, and seemed to extend along the plain for a mile or more. I was desirous to examine these springs; but the intervening space was so much overflowed, that it was not considered safe to do so. I could obtain from the arrieros no information about them. A number of ducks were shot near our camp.

October 15th. On leaving this morning, we struck at once into the plain, which, as far as the eye could reach, was covered with water, appearing like a vast lake. We could trace the road by the tall grass and bushes, on which the water was from fifteen to eighteen inches deep. The ground being soft, our wagons sank deeply into it; and it was with the greatest difficulty that our animals could drag them through. A space of a few hundred yards would have been bad enough through such a depth of mire and water; but a steady tug of three or four miles was a very serious matter. Now and then the wagons would plunge into a deep hole, from which it was difficult to extricate them. In one of these the Doctor's carretella sank so suddenly, and to such a depth, that the king-bolt broke, and the fore wheels separated from it. Fortunately a small portion remained, which was kept in its place by straps. This was almost as bad as the deep sand, and we were obliged to make frequent stops to let the animals rest.

We at length reached dry ground, and the wagons succeeded in getting out, except one, the heavy "ark," which mired so deeply that the six mules could not extricate it. We doubled the team; but the mules being unmanageable in the mire and water, the tongue was snapped off. An hour or more was spent in splicing the tongue, when the twelve mules were again hitched on. When all was in readiness for another effort, men were placed with whips at each span of mules: at a given signal, the whips were simultaneously laid on; whoops and yells, mingled with a shower of oaths, followed, and the frightened animals made a united

spring. The animals cleared themselves, breaking every chain, and leaving the ark where it was. Finding it impossible to extricate it with its contents, it was unloaded, and the twelve mules again attached, when another and united effort brought it to dry land. This was not effected until the men had been knee-deep in mud and water for four hours.

While this was going on we amused ourselves with collecting insects, reptiles, and other objects in natural history, of which quite a number were obtained. At one o'clock we again moved off, over a superb road, and in twelve miles reached Carrizal (country of reed grass), and encamped near an old acequia half a mile from the town, the water in which was scarcely fit for the mules to drink. I did not wish to go to the town, as experience had taught me that it was best to avoid the Mexican settlements. We had not been in one where the arrieros or teamsters did not get into a row, or return to camp in a state of drunkenness. Mr. Thurber rode to the town, and purchased a supply of corn sufficient to take us to Chihuahua, together with some goats, as sheep were not to be had.

Carrizal is an old dilapidated presidio, and now nearly depopulated; more than half the houses being tenantless. The lands about it are rendered fertile by irrigation, and in former years were cultivated. It derived some advantage too from passing travellers and caravans, as it is the only town between El Paso and Chihuahua. The inhabitants being completely at the mercy of the Apaches, they barely gain an existence; for these inveterate robbers boldly enter the place by day and help themselves to what they want;

whether it be corn, a fat mule, or an ox. The people are too few to make any defence, and quietly submit to be plundered. At the last visit of the marauders, they entered every house, and each provided himself with a blanket, from the shoulders or beds of the inmates.

October 16th. Our route continued over the same broad and boundless plain we had been traversing since we first ascended the plateau from the Rio Grande. Mountains were seen only at a great distance, while nearer at hand a few low hills rose up here and there. Twelve miles brought us to *Ojo Caliente* (Warm Spring). Although we had made but a short day's march, it was thought best to stop here; as there lay before us a jornada of fifty miles without water, which it would require two full days to accomplish.

Ojo Caliente is a spring which rises from the plain about one hundred and fifty yards from the base of a rocky hill. Its temperature is nearly the same as that of the atmosphere. A small pool about one hundred and twenty feet in circuit, and from three to four deep, is here formed, with a sandy bottom, from which warm water bubbles up in many places; this water has an outlet through a small creek into the river Carmen, in which creek some fish were taken and preserved for specimens. This basin afforded an excellent opportunity for a bath, and the whole party took advantage of it. A well built stone wall, about a yard in thickness, and laid in cement, is built across the basin, apparently for the purpose of raising the water. A portion of this wall is now broken away. I imagine it to be the work of the Spaniards, who, at some former period, have

resorted hither for the benefit of the water. No traces of buildings could be found near the pool; yet there may be in the plain near. It is now, and doubtless has long been the resort of Indians, as there are many mortars in the adjacent rocks. Along one side of the hill there appeared to be a rude wall; and on the summit were circles and heaps of stones, which bore the traces of fire. From here a most extensive view was presented, on three sides unobstructed by mountains.

October 17th. By seven o'clock, A. M., we had resumed our journey over an excellent natural road, equal to the best turnpike. About a mile from camp we crossed the *Rio Carmen*, a considerable stream, although dry during the summer, when the water is most wanted. Our course was due south; and during the thirty-five miles made to-day, not a hill, gully, or ravine, was passed. There was a gradual ascent for at least twenty miles, with no mountains in sight. A few rounded hills were seen at long intervals; and through the openings in these, the plain seemed to extend for sixty or eighty miles. It was covered with a luxuriant growth of grass, with scarcely a bush as large as one's finger. In order to advance as far as possible, we kept on till dark, and encamped without water. A few little twigs gathered as we came along, was all the fuel we could procure.

October 18th. Moved from camp a little after seven o'clock. The plain was open, except on our right, where, at a distance of a mile, ran a high range of hills. On starting, I rode on my mule a short distance ahead, accompanied by Messrs. Radziminski, Pratt, Seaton, Force, and Dr. Webb. Soon after we saw the

train start; whereupon we held in our animals, that it might the sooner overtake us. About a mile from camp we passed a small arroyo, or ravine, pretty well filled with bushes. This arroyo was no sooner passed by the foremost wagon in the train, than we were startled by the most terrific yells and shouting; and on turning our heads, to our horror we saw a band of Indians issuing from the arroyo we had passed, and charging upon the train. We immediately turned about, put spurs to our animals, and rode back with all speed towards the train. The savages, who numbered between thirty and forty (as stated to me by those in the rear), were rushing at full speed with their lances poised, screaming and yelling, endeavoring to break the line and stampede the mules, as they crossed from one side to the other. Others followed, discharging their arrows at the teamsters as they passed; but the teamsters remained each by his team, keeping the mules in their places, and closing up the line. At the same time they kept the enemy at bay by levelling their pistols at them. These men had the presence of mind to keep their seats in the saddle and to hold their fire, which the savages wanted to draw. Had they fired and missed their mark (and the chances were ten to one against their hitting), they would have been pierced by a lance or an arrow the next moment.

The men who were riding by the side of the wagons sprang to the aid of the teamsters, and held the leading mules, which kept them in their places.

Failing in their attempt to frighten the mules and throw the train into disorder, the Indians dashed on towards the rear, and made a furious charge on the

APACHE INDIANS ATTACKING THE TRAIN AND PARTY.—p. 412.

party there who were driving the spare mules and horses. Two Mexicans, herdsmen, were unhorsed by the charge; and a third, being wounded, fell from his animal. He, however, held on to his bridle, when an Indian rushed at him and pierced him to the heart with his lance. The momentary pause of this man made him a good mark for the rifle, and sealed his fate. Several were discharged at once, which brought the fellow to the ground. His companions seeing him fall, ran to his rescue, raised him up, and threw his bleeding body across a mule ridden by another Indian, when they rode off at full speed.

The firing now became general; but the constant motion of the enemy, enabled them to escape. The five Mexican soldiers, who were on foot, stood up to the fight manfully, and were in the thickest of it. They did much, too, towards saving the last wagon, which had got separated, and was one hundred and fifty yards in the rear. The driver of this team, when he saw the Indians between him and the rest of the train, jumped from his mule, and, bringing the leaders around, fastened their heads to the wagon. He then took out his rifle and stood on the defensive, levelling it at each Indian as he approached, and thus keeping them at bay.

The Indians next made for Mr. Thurber, who was still further in the rear, and at the moment engaged in putting some plants into his portfolio. They dashed at him with their lances, and he had barely time to seize his revolver, with which he kept them off. Our men were now close at the enemies' heels; so that, finding themselves in rather a tight place, they made for the

adjoining hills, pursued by six or eight of our party. The fleetness of their horses and their knowledge of the ground, gave them the advantage; so that after a pursuit of a mile or two, we gave up the chase, fearing the train might encounter a larger body of Indians in ambush, for they scattered in all directions, and concealed themselves among the rocks or ravines of the hills.

The spare animals were all stampeded and lost. They became frightened at the first charge, and, not being fastened, were rushing at the top of their speed over the plain, driven by a portion of the enemy, before we who were in advance could reach them. We lost ten mules and a valuable horse—and secured the horse, saddle, and arms of the Indian that was shot. Two of the wagons were pierced with bullets, and several arrows were found sticking in the wagons near the teamsters.

We dug a grave by the side of the road, and deposited in it the body of the unfortunate Mexican who was killed. This being done, we hastened away from the sad scene, the first and only occurrence of the kind that had befallen the Commission since it entered the field, now more than two years.

We had proceeded but a few hundred yards when we noticed several heaps of stones, some of them surmounted by small crosses, to mark the spots where murders had been committed but a short time before, as appeared by their freshness. Fragments of clothing also lay around, showing that a severe contest had taken place. Fearing that the Indians might rally in larger numbers and renew the attack, two soldiers

were sent ahead, while the others kept at a distance on the right and left, to give us early notice of the approach of danger.

Eight or ten miles brought us to a point opposite the *Ojo de Callego* (Spring of the Mountain Pass), a ravine in the mountain on our left, where there was a fine spring in a thick grove of cotton-woods. It seemed a likely place for Indians to conceal themselves in, and, with an enemy at our heels, we had no desire to stop there. We therefore filled our water kegs from a pool near at hand, without entering the ravine. A couple of miles further on, we passed the *Ojo de Callecito*, marked by a few cotton-woods on the mountain side. Soon after this, we met a body of about twenty Mexican soldiers in charge of a lieutenant from Chihuahua, bound for El Paso. They were the men who had escorted the merchant train from El Paso, to which I have before alluded. From them we learned that Armiño's train of empty wagons, which left that place the day before us by way of the Sand-hills, had been attacked by the Apaches near the place of our encounter with them, and had lost six men and thirty mules.

Continuing our march until dark, in order to get as far as possible from the scene of the morning, we encamped on the open plain, making a corral of the wagons and tents, and bringing all into as compact a space as possible. The animals were either tied up close to the wagons or staked within the inclosure, and the guard doubled for the night.

During the day's journey, which did not exceed eighteen miles, mountains were near us on the left.

The grassy plain continued without bushes; so that we were obliged to gather up dried dung for fuel.

October 19th. Before daylight the camp was called, and every man was perambulating the corral and the vicinity with his arms in hand; for it is well known that these savages generally take the dawn of day to surprise unconscious travellers. Sentinels were sent out to reconnoitre, and eight men to guard the mules while grazing.

At six o'clock, we moved again over an excellent road as before, the grass luxuriant as far as the eye could reach. Antelopes and deer were seen in herds bounding over the plain, sometimes coming within gun-shot of us. A few shots were fired without success, the open plain preventing our hunters from getting as near as they wished. Fifteen miles brought us to the *Laguna de Encinillas* (Lake of Evergreen Oaks), which lay on our right, stretching far off into the plain in a southerly direction. It is said to be about fifteen miles long and three wide, varying according to the season and the rains. This lake, like all others on the high table, while it receives much water, has no outlet. Forming the basin of a vast plain, its waters rise with the rains, and in the dry season are much lessened, and sometimes nearly dry. It is only remarkable, considering the porosity of the soil, and the rapid evaporation from the dryness of the atmosphere, that the whole does not disappear before the return of the periodical rains. As the water was said by our Mexicans to be brackish, we supplied ourselves from a spring about a hundred yards from its shore. After the camp was arranged, I took my gun

and went to the lake. On tasting the water, to my surprise I found it perfectly sweet, in fact better than that in the spring. It is therefore probable that after the rainy season the lake so fills up that its brackishness is overcome. Its shores, as well as the adjoining plain, are covered with what the Mexicans call *tequesquite*, or alkaline salt in a state of efflorescence. Brant, ducks, and plover abound in its waters, some few of which we shot.

Soon after we encamped, a stray ox was discovered among the mezquit bushes which skirted the base of the hills. We did not hesitate to drive him to camp for the benefit of the party; for we had been living on very poor goat's meat since leaving Guadalupe. This fine beef proved a valuable accession to our stock of provisions; as many could not stomach the meat of a poor goat, after he had been driven twenty or thirty miles.

October 20th. We continued along the shores of the lake for fourteen or fifteen miles, through a plain covered with grass. This plain was ten or twelve miles wide, bounded on the east by a range of hills, and on the west by rugged mountains. On the opposite side of the lake appeared a hacienda amid a grove of cotton-woods—a beautiful spot, which might compare with the highly cultivated grounds of a European nobleman; but the mark of ruin was upon it—the Apaches had driven away its occupants, and it was fast crumbling to decay.

Twenty miles brought us to *El Peñol*, a large hacienda, near which a herd of cattle was grazing. There did not appear to be any land under cultivation here:

the raising of stock, for which the broad grassy plains are so admirably adapted, seemed to be the sole purpose of the establishment. Near by is a small stream of clear water, bearing the same name as the hacienda, which discharges itself into the lake. On the opposite side of the valley, to the west, and near the termination of the lake, is the village of *Encinillas*, consisting of a church and a cluster of adobe houses. This village, as well as El Peñol and the vast grounds adjacent, are the property of General Trias, formerly governor of Chihuahua.* His estates at the time of the invasion of the Americans contained many thousand head of cattle, which he gave to his government for the support of the army, and for which, I was told, he has never made a claim.

We passed to-day a train of mule-wagons and a carretella on its way to El Paso. There were but few persons in it, except the teamsters; among them, however, I noticed several women and children. We told them of the attack made on us by the Apaches two days before, and advised them to be on their guard. Three Americans and a Mexican, who were with the train, became so alarmed that they left it, and joined us, to return to Chihuahua.

October 21st. Continued our journey through the same valley, the mountains now converging to a point some miles in advance. In crossing Peñol Creek we found innumerable quantities of wild ducks. The surface of the water was literally darkened with them;

* Don Angel Trias was again chosen Governor of the State in the year 1853.

and when at our approach they rose, the noise seemed like distant thunder. I shot twelve, and others of the party brought in numbers. They were all teal.

A few miles brought us to the hacienda of El Sauz (The Willow)—a building inclosed by a wall full twenty feet high. This estate also belonged to General Trias. We stopped a few minutes at the gate, and the occupants came out to meet us. We endeavored to buy eggs, poultry, or some other kind of fresh provisions, but found they had "*nada*," nothing, for sale. This establishment had likewise suffered from the Indians, notwithstanding its high wall, which would inclose many hundred cattle. On one occasion the savages for mere sport lamed a large number of these cattle, and filled up a well near by with their carcasses. On the opposite side of the valley is a village called *El Sauzillos*, or Little Willows.

After a march of twenty-four miles from El Peñol, we reached the Sacramento River, and encamped near the famous battle-field where Colonel Doniphan and his brave Missourians gained the decisive victory which resulted in the surrender of the city of Chihuahua.

The Mexicans did not show much judgment in the selection of this spot to resist the approach of the invading force. It is on the level summit of a plateau some sixty feet above the valley, and about half a mile in width. The plateau juts directly across the valley we had been travelling, and leaves but a narrow passage to the east. If the Americans had been obliged to march through this valley, the position of the Mexicans would have been a good one. But it was unnecessary for Colonel Doniphan to force a pass, and thus

give the Mexican batteries full scope to play upon him, when, by diverging half a mile or less to the right, he could avoid them entirely. This he did without delay, unattended with loss; and on reaching the plateau, he advanced at once to the attack with an open field before him. By this course he exposed himself only to the right or western battery, on which he immediately opened his fire, striking terror into the ranks of the enemy, which retreated to the adjoining batteries and entrenchments. These also fell, the Mexicans retreating to a hill on the opposite side of the valley of the Sacramento, where the final conflict took place. This valley is less than half a mile wide, and is intersected by the river of the same name, a stream ten or fifteen yards wide, and about a foot deep.*

* I annex the most brief account of this battle, which is contained in the official report of Lieutenant Colonel Mitchell, one of the field-officers:

“Immediately after gaining the table-land on the enemy’s left, I took command of the right wing of the army, in obedience to your orders, and at the same time gave the necessary instructions to the traders and teamsters in our rear, so as to form a field-work with the wagons to fall back upon in the event of our being too hardly pressed by overwhelming numbers. After the artillery firing (on both sides) ceased for a few moments, I ordered the right wing, consisting of about four hundred and fifty mounted riflemen, to advance in a gallop towards the enemy’s entrenchments on their left.

“During this movement, a battery of five pieces of artillery on the point of a hill, six hundred yards to our right, opened an enfilade fire on the left of our column, which did no execution.

“By a rapid advance, we reached a deep ravine about one hundred and fifty paces in front of the enemy’s field-works; here I ordered the troops to dismount and charge as skirmishers. The Mexican troops

There is a hacienda with other buildings here. A portion of the valley might be cultivated by irrigation ; but it is for the advantages it offers for grazing, that the land is valuable.

October 22d. Chihuahua is called twenty miles from Sacramento, which is a large estimate. Resuming our journey this morning, we came in sight of the city on reaching the crest of an elevated plain ten miles distant, from which there is a gradual descent to the city. This plain is of a desert-like character, without grass, and covered with small mezquit bushes. As we approached, and when within four or five miles of the city, it presented a beautiful appearance, surrounded on three sides by picturesque mountains with bold rocky sides quite detached from each other. Chihuahua lies in a basin formed by these mountains, and is encompassed with fine large cotton-woods, from which

maintained their positions with much gallantry until we advanced within twenty or thirty paces of their entrenchments ; at this distance the fire of our men was unerring, and any Mexican who raised his head above the breastworks fell. They soon broke and fled in the utmost confusion, and in every direction, towards the surrounding mountains. I immediately ordered the men to remount and charge the battery on our right, which was done in gallant style. When we reached the top of the hill we found that the Mexicans had fled, leaving the whole of their cannon, ammunition, wagons, etc. I saw them retreating in every direction *on foot*. As cavalry we could have followed and cut off great numbers ; but the victory was complete, and I wished to spare the useless effusion of blood.

“The morning after the battle, I entered the city of Chihuahua at the head of two companies of mounted men and two field or mountain howitzers from Major Clarke’s battalion.”—*Report of Lieut. Colonel Mitchell to Colonel Doniphan. Executive Document No. 1, 30th Congress, 1st Session.*

the towers and dome of its cathedral, and the spires of its lesser churches stand out in bold relief against the adjacent hills. To the right and left along the stream which waters it lie many large haciendas deeply buried in groves of luxuriant trees, presenting altogether the most charming landscape we had yet seen in Mexico. On the road we passed many men gathering fuel for the city market. This consisted of dried bushes and brushwood; which, when collected, they tied up in huge bundles, and carried in on their backs.

Carrying wood to Chihuahua.

Both men and boys were engaged in this business; some of whom we passed full six miles from the city,

barefoot and almost naked, sweating under their heavy burdens. Donkeys in trains carrying wood, or completely enveloped in loads of dry corn-stalks, were also wending their way to market. These patient animals are much used by the poorer classes to carry their burdens.

I sent Messrs. Thurber and Jacobs in advance, in the morning, with my letters of introduction for Governor Cordero and General Trias, as well as to select a suitable place for an encampment. This they accomplished, and met us as we entered the city. We drove at once through the town amid a tremendous cracking of whips, which teamsters take particular delight in on such occasions, to the "*Buen Viage*," a large inclosure with a high wall. Within this all the wagons were driven, and on one side the tents were pitched. This was a great convenience to us, as we were free from the annoyance of the lazy, pilfering class which hover about a town, and by whom a train and party like ours would be considered fair game.

CHAPTER XXXIX.

CHIHUAHUA AND ITS VICINITY.

Repairs on wagons—Mr. Flotte and his persecutions—The road infested by Comanche Indians—Guard hired—General Trias—Governor Cordero—A dinner and ball—Ladies of Chihuahua—Dinner to General Trias—Obtain important documents relating to the Boundary—Description of Chihuahua—Causes of its decline—Its mines—The expulsion of the Spaniards—Labors of the Jesuits—Aqueduct—The Cathedral—Mine of Santa Eulalia—Casa de Moneda—Commerce, how carried on—Agricultural products—Alfalfa and its value—Heaps of scoria—Grazing lands—The plateau—Immense herds of cattle—Height of the tableland—Climate—Diminutive dogs.

OUR journey of two hundred and seventy miles from El Paso had disabled several wagons, which had now to be repaired. It was also necessary to replace the eleven mules we had lost. I determined to engage here a few additional men as a guard; as we yet had a journey of eight or nine hundred miles before us before we should strike the Rio Grande, the greater portion of which distance, I now learned, was infested with the Comanche Indians. This tribe is ten times more numerous than the Apaches; they are among the finest horsemen in the world, possess many fire-arms, which they know how to use, and go in large bands. They are, therefore, far more to be dreaded than the Apaches, whose range we had now passed.

We had no sooner arrived, than the character of our party was known throughout the city ; and many applicants appeared in quest of employment, most of them persons who wanted to get to their homes. Among these were several Americans from Texas, who had come here with merchant trains, and been discharged. They earnestly begged for situations, or to be permitted to accompany the train for the protection it would afford them. I selected such men as I required, among them an excellent blacksmith, whom I wanted exceedingly, and could not procure at El Paso.

The American consul, Bennet Riddells, Esq., called the morning after our arrival. This gentleman has long resided in this city, and is married to a Mexican lady. Having letters of introduction to a number of the principal citizens of the place, Mr. Riddells accompanied me in delivering them. Among the gentlemen on whom I called, were Señores Chaves, Zuloaga, and Jaques, Captain Bustamente, and Dr. Dubois, the last a French physician of high scientific attainments, and long resident in Chihuahua. Several of the American residents called on me during the day, among them Mr. Lewis Flotte, of Barranca Colorada, the gentleman whose silver mine and smelting works I visited on my way from Correlitos to El Paso.

I heard from Mr. Flotte, a reiteration of what I had been told at Correlitos, and at the mine, of his persecutions ; in consequence of which, he had been driven to the extremity of selling his mine as well as his estate at Barranca, at a great sacrifice. He had endeavored in vain to obtain protection of the State authorities. The statement of Mr. Flotte was corrobo-

rated by the American Consul, who was familiar with the facts; and I learned from them that the matter would be laid before the United States government.

General Trias called, and very politely tendered me a furnished house while I remained in Chihuahua; which, however, I declined. Experience had shown us that after once going into camp life, it is better to remain there steadily. One soon becomes accustomed to a tent; and even in cold weather, it is preferable to quarters, unless one is to remain permanently in them. The change from one to the other, invariably produces colds.

General Trias, who was for several years Governor of the State of Chihuahua, is a gentleman of large wealth and fine accomplishments. After receiving his education he went to Europe, where he spent eight years travelling in various parts, although he remained most of the time in England and France. He is well versed in several of the European languages, and speaks English with great correctness. Of English literature he told me he was very fond; and he considered that no native appreciated the beauties of Shakspeare and Milton better than he. With Addison and the belles-lettres writers of England he was also familiar. With large estates, a cultivated mind, and elegant manners, General Trias cannot but exercise a great influence in the State. I have before mentioned the sacrifices he made when his country was invaded by the Americans, which greatly impoverished him. There are not many such patriots in Mexico; if there were, she would not be in the position she now is. There is no doubt that General Trias detests the Americans as a people; yet

American gentlemen and officers who stop at Chihuahua, are always treated by him with great politeness and attention. He is ardently devoted to Santa Ana, and is considered at the head of the war party in his State.

Governor Cordero, who also honored me with a call, is the entire reverse of General Trias. He is a merchant and banker, the owner of a very large landed property, and is considered the richest man in the State. As a politician, he is at the head of the moderate party.

A few days after our arrival, I heard that the train we passed on its way to El Paso was attacked by the Apaches at the same place where we had the encounter with them, and that it lost twenty-eight mules. Several men were killed, and three of the women made captives.

On the 28th, I was invited, together with the officers of the Commission, to a dinner given by General Trias. Besides the gentlemen who accompanied me, there were about forty others present, embracing officers of the Mexican army and citizens of the place. The entertainment was conducted in true Mexican style, embracing a great variety of dishes served up in as many courses. The waiters were all soldiers, and performed their duty as well as the trained functionaries at our large hotels. A band of music was in attendance, and the affair was, on the whole, an elegant one. Patriotic toasts were drunk, and among those given by the Mexicans were Washington and Franklin. In return we gave the heroes of the Mexican revolution, Iturbide, Hidalgo, Allende, and Jimenez.

On leaving the table, we adjourned to the drawing

room, where a large number of ladies soon after assembled to a ball. This was an afterpiece as unexpected to us as it was agreeable. The Mexican ladies, it is well known, have a great passion for balls, and are most graceful dancers. They kept it up incessantly, alternating from quadrilles to waltzes and polkas, without manifesting the slightest fatigue. The music was very good, consisting of harps and violins. One would hardly expect to find in a town situated as this is, on the very confines of civilization, twelve hundred miles from the capital, and six or eight hundred from either ocean, so much elegance of manner and taste in dress; for few of the ladies had ever been from home. Many possessed as fair complexions as English or American ladies, although the brunettes predominated. The Mexican like the Spanish ladies have a natural gracefulness of manner, which has been observed by all travellers, and has captivated most foreigners who have taken up their residence in the country.* On this occasion, one would imagine the most fashionable dress-makers and hair-dressers had been employed, and that Stewart had a branch of his great New York establishment here, from which the gorgeous silks and satins and elegant muslins displayed in such profusion had been procured. I noticed one custom, however, which the Chihuahua ladies have not borrowed either

* It is a fact worthy of mention, that every married American or European whom I met at San Diego, Guaymas, Mazatlan, Hermosillo, Ures, El Paso, and Chihuahua, had, without a single exception, a Mexican wife. Subsequently, in my visit to Parras, Saltillo, and Monterey, I found it to be the same; nowhere did I meet with an American or foreign lady.

from New York or Paris. This was smoking cigarritos between the dances. It is true these little cigars are mild, and, being exhausted with a few puffs, are not accompanied by the filthy practice of spitting. Gentlemen use their cigars also in the ball-room; so that at times one has to confront quite a cloud of smoke.

A few days after this entertainment, I invited General Trias, four of his officers, and the American consul, Mr. Riddells, to a dinner in my tent, that number being as many as it would accommodate, with the gentlemen of the Commission who were present.

I took advantage of my stay here to seek for information relating to the northern boundary of the State, and was so fortunate as to find in the Governor's office a large manuscript map of the State of Chihuahua made by Don Pedro Garcia Conde, and Mr. Staples. It appeared that in the year 1833, the Legislature of the State ordered a geographical, topographical, and statistical survey to be made of the State. These gentlemen were the engineers in charge of the work, and the map alluded to was the result.

I also procured a copy of the Statistical Report or Essay made by the same commission,* which report was presented to the government in the year 1836 and printed in 1842. In the map and Statistical Report the northern boundary of the State is laid down and defined in latitude $32^{\circ} 57' 42''$.

Of the map a fac-simile was made by Mr. Radzinski, the principal assistant engineer of the Bounda-

* Ensayo Estadístico sobre el Estado de Chihuahua. Chihuahua, Imprenta del Gobierno, á cargo de Cayetano Ramos. 1842.

ry Commission, and a certificate appended to it by Governor Cordero, stating that the original was made by Messrs. Garcia Conde and Staples, in the year 1834. This is now in my possession.

I also obtained a certified copy of the 2d Article of the Constitution of the State, in which the boundaries are defined, and which agrees both with the map and the Statistical Report.*

* The following is a copy of the Governor's certificate :

“GOBIERNO DEL ESTADO DE CHIHUAHUA :

“El ciudadano JOSE CORDERO, Gobernador Constitucional del Estado de Chihuahua,

“Certifico: que el artículo 2º. tit. 1º. de la Constitucion de este Estado, promulgada en 7 Diciembre de 1825 y reformada en 7 de Diciembre de 1847, se halla redactado en los siguientes terminos.

“ART.º. 2º. El territorio de Chihuahua es el que ha poseido y se le ha reconocido hasta ahora entre los 25º 53' 36'' y los 32º 57' 43'' de latitud Norte ; y entre los 1º 30' 16'' y los 7º 17' 52'' de longitud Occidental de Mexico, segun la carta geografica del mismo Estado, formada por los Señores Staples y Garcia Conde en el año de 1834.’

“Y á pedimento del Señor Presidente de la Comision de Limites de los Estados-Unidos del Norte D. John R. Bartlett, le doy esta en Chihuahua á veintisiete de Octubre de mil ochocientos cincuenta y dos.

(Signed)

JOSE CODERO,

(Signed)

AMADO DE LA VEGA.

Of. 1º.”

“CONSULATE OF THE UNITED STATES OF AMERICA,
CHIHUAHUA, October 28th, 1852.

“I, Bennet Riddells, Consul of the United States of America, for Chihuahua, Mexico, do hereby certify, that the above signatures of Jose Cordero and Amado de la Vega are genuine, and that Jose Cordero is acting Governor of this State, and Amado de la Vega, first official.

“Given under my hand and seal of office,

“BENNET RIDDELLS,

“U. S. Consul.”

Chihuahua is the capital of the State of the same name, and was settled towards the close of the 17th century by some adventurers, for the purpose of working the rich silver mines discovered about that time in its vicinity. When these mines were in their most prosperous state, the city contained more than seventeen thousand inhabitants. According to the census of 1833, it contained ten thousand six hundred and two; and at the present time, its population does not exceed twelve thousand. This diminution is owing chiefly to the unsettled state of the country for the last twenty-five years. With the general expulsion of the Spaniards which took place after the revolution, this city, in common with every other in Mexico, lost its most active, enterprising, and intelligent citizens. Much of its wealth, too, was then carried away. After this, the mines, which had yielded an amount of silver almost unparalleled, and had enriched thousands, were but imperfectly worked, and many were in course of time abandoned. The rural population being thus deprived of its chief dependence, the haciendas and ranchos which dotted the beautiful and luxuriant valleys met the same fate. In this way Chihuahua has greatly decreased in wealth, in commerce, and in general prosperity.

There is still another cause for the decline of Northern and Central Mexico which deserves to be noticed. I allude to the expulsion of the Jesuits. Whatever may have been the sins ascribed to this religious order, it is an undeniable fact that during their sway these States attained a higher degree of prosperity than at any other period; and with them

this prosperity departed. This remark will also apply to California while under the dominion of Mexico. No one has ever kept the Indians under such subjection as the Jesuits; and when the latter were expelled, all control over the former was lost. In every large town are seen the fine edifices which were in the course of erection by them. Chihuahua possesses one of these, a large church and college, the walls of which were nearly up. These buildings remain just as they were left.* An apartment in the college was the place of confinement of the patriot Hidalgo and his associates, who were executed here in 1811. It is now a blacksmith's shop.

The city is regularly laid out, with broad and clean streets, some of which are paved, and contain handsome and well-built houses, both of stone and adobe. When of the latter material, they are plastered or stuccoed, and afterwards colored or whitewashed. Most

* Christian sects may cavil about their success among the Indian tribes; but it is an undeniable fact, that the Jesuits during their sway accomplished more than all other religious denominations. They brought the tribes of Mexico and California under the most complete subjection, and kept them so until their order was suppressed. And how was this done? Not by the sword, nor by treaty, nor by presents, nor by Indian agents, who would sacrifice the poor creatures without scruple or remorse for their own vile gains. The Indian was taught Christianity, with many of the arts of civilized life, and how to sustain himself by his labor. By this simple means the Society of Jesus accomplished more towards ameliorating the condition of the Indians than the United States have done since the settlement of the country. The Jesuits did all this from a heartfelt desire to improve the moral and social as well as the spiritual condition of this people, and at an expense infinitely less than we now pay to agents alone, setting aside the millions annually appropriated for indemnities, presents, etc.

of them have but one story ; yet they are large, and built in squares, with courts in the centre. Having thick walls and few windows, such dwellings are cooler and better adapted to the climate than if built in our northern mode. The rooms are always from fourteen to eighteen feet high, with brick floors, which contribute to their coolness.

An aqueduct supplies that greatest of luxuries, an abundance of pure water. It is well constructed of stone, and, with its long ranges of arches winding over the rough ground and spanning the valleys on its way to the city, presents a highly picturesque appearance. It was built at the close of the last century, and has an extent of about three miles and a half. In addition to this, a small stream runs by the northern part of the city ; so that in respect to water, no city is better supplied.

The most important edifice in Chihuahua is its cathedral, or, as it is here called, the parochial church. This stands on one side of the plaza. It is built of cut stone, of a very light color, and has two well-proportioned towers and a dome. The people pride themselves much on this building, which is said to be only second to the great cathedral of Mexico. If strict adherence to the principles of a particular order of architecture constitutes beauty, this edifice will be found wanting. It partakes of the Gothic and the Elizabethan styles, with a profusion of ornament, similar to that which was practised in Spain after the expulsion of the Moors ; still its appearance is very imposing, and is equalled by few churches in the United States. Its interior is less chaste than its exterior.

This church was erected from a fund raised by a tax of one real (twelve and a half cents) on every mark of silver (eight dollars) obtained from the mines of *Santa Eulalia*, five leagues from the city. The fund was collected during a period of seventy-two years, commencing in the year 1717, and terminating in 1789. From it was built the Cathedral of Chihuahua, at a cost of eight hundred thousand dollars, and a church at Santa Eulalia at a cost of one hundred and fifty thousand dollars, leaving a considerable sum unexpended. From this may be formed some idea of the richness of the mines of this country. These sums, raised by a tax at the rate mentioned, would require a gross income on the part of the mine of fifty-one million two hundred thousand dollars to erect the former, and nine million six hundred thousand dollars for the latter edifice, or, together, sixty million eight hundred thousand dollars. Nearly a million of dollars a year, for seventy-two years.

The square on which this church stands is occupied with various public buildings; among which, on the east side, is the Governor's Palace, as it is called, but which merely embraces his reception room and the State offices.

There are several other churches in the city, which, though small, are built with much taste. One of these, Santa Rita, is shown in the sketch.

There is a *Casa de Moneda*, or Mint, here, which I visited. In it silver and gold are coined, but chiefly silver, and that by a most primitive process of manual power. Each State in which there are many mines has a mint, which is let to an individual or firm, and is

not under the direction of the State or general government. For coining a mark of silver, without separating the gold, the charge is two reals (twenty-five cents); for coining and separating the gold, five reals (sixty-two and a half cents). This coin is said to yield a profit of five per cent. upon its current value at the United States Mint. It is put up in sacks of raw hide containing one thousand and two thousand dollars each. These shrink on drying, and press the coin so closely as to prevent friction. All the silver in the State contains gold, which is separated in large platina kettles, with the aid of sulphuric acid. I saw two of them, which had a capacity of about five gallons. They looked little better than our iron camp kettles, and cost five hundred dollars each.

Among other public places of note is an arena for bull fights, a favorite amusement with the Mexicans. An exhibition took place while we were here; but having once witnessed one of these cruel sights at El Paso, I had no desire to be present at another.

In an open square in another part of the city is a rude monument, of an obelisk form, to the memory of the heroes of the revolution, Iturbide, Hidalgo, Allende, and Jimenez, but without any inscription. On one side of this square was pointed out to me the place where the Emperor Iturbide was shot.

There is a large trade carried on here with the United States, by means of caravans or trains from Saint Louis, Missouri, and San Antonio, Texas. Until very recently, the trade was carried on wholly by way of Saint Louis, Santa Fé, and El Paso, a distance of more than one thousand five hundred miles, and re-

quiring months for the journey. Latterly, a much shorter route has been opened by way of San Antonio and the Presidio del Norte, lessening the distance of land carriage more than one half. Formerly traders left Missouri with large trains of merchandise, and, on arriving here, opened their stores and sold their goods themselves. This was a very irregular business, leading sometimes to the accumulation of large stocks, and proving ruinous to some of the parties concerned. The trade is now more confined to the resident merchants of the city. Governor Cordero is one of the largest merchants; and next to him are several American houses of high respectability. There are now some fine stores in the town, in which every variety of merchandise can be procured.*

* If a merchant here desires to make his purchases himself in New York or our other great markets, he must leave here in the fall, when it will require from forty to fifty days to reach his destination, by way of New Orleans. His goods must then be purchased and shipped either to Indianola, on the Gulf of Mexico, to be sent by San Antonio, or to St. Louis, Missouri, and thence by water to Independence. Now comes the most difficult part of the transportation (say, for example, from the latter place). Wagons, mules, harness, and the various trappings must be purchased, and teamsters procured; all of which requires much time and a large outlay. The large Missouri wagons, which carry from five thousand to five thousand five hundred pounds, cost about two hundred dollars each; the best Kentucky mules, ninety to one hundred dollars; harness, one hundred dollars; water kegs, extra chains, ropes, etc., twenty-five dollars for each wagon. These large wagons require ten mules each; so that a complete team ready for the plains would cost from twelve hundred to thirteen hundred dollars; and twenty of these, which is not a large train, twenty-six thousand dollars. Then each team must have its teamster at from twenty to twenty-five dollars a month; and a wagon-master or director of the train at from eighty to one hun-

In the vicinity of the town are many fine gardens, which are irrigated from the aqueduct or the natural stream. We were not here in the season to see their beauties, and I visited them but once. The fruits cultivated are apples, pears, peaches, figs, melons, and grapes. The variety of vegetables is not large; not on account of the incapacity of the soil or the climate to produce them, but for want of attention. Those generally cultivated are beans, peas, maize, red pepper, tomatoes, onions, lentils, beets, cabbages, etc. Wheat, barley, and *alfalfa* (a species of lucerne), are cultivated on the farms.

The alfalfa is extensively cultivated as far north as El Paso, and is every where considered as one of the most profitable of farm crops, yielding abundantly without irrigation, and possessing the valuable property when once established of flourishing in perennial vigor for any length of time. In the vicinity of Chihuahua, where the climate is mild, it is cut eight times a year, and sold for green fodder at a real (twelve and a half cents) per bunch of twenty-five pounds. Mr. Riddells, our consul here, stated, that from a field of fif-

dred dollars a month. From fifteen to twenty extra mules would be necessary for such a train; as, on their long journeys, accidents cannot be avoided. Men to herd and take care of the animals must also be provided; and, finally, provisions for the journey. This will give an idea of the expense of fitting out a caravan or train; and if the merchant gets back with his goods in ten months from the time he left, without encounters with hostile Indians, or the loss of any of his wagons and their contents, in fording streams and otherwise, he may consider himself fortunate. It cannot be expected that a merchant will be satisfied with very small profits after such an expedition.

teen acres he had realized in one year two thousand one hundred and eighty dollars. This field when I saw it, on the last day of October, was as green as our meadows in June.*

I shall not enter into any particulars as to the great number and variety of mines in the State of Chihuahua, as the subject is too extensive to be treated of in a work like the present. I have, however, collected much information respecting it, which may hereafter be given to the public. At present I will merely say, that the mineral wealth of Chihuahua is not surpassed, if equalled, in variety and extent by any State in the world. Silver is the most abundant; but there is also gold, copper, lead, iron, and tin. Cinnabar is also said to be found; but I cannot speak of it with certainty. Of bituminous coal I saw a fine specimen.

* A late San Francisco paper, in speaking of the introduction of *alfalfa* into California, where it is known as "Chilian clover," says it is greatly in use in the mining districts of Chili, where the lands are very sterile, and rain is of seldom occurrence. "Natural grasses are, therefore, of scanty growth; and the miners are compelled to rely for the maintenance of their animals upon the alfalfa estates, which lie within the narrow valleys of that mountainous region. The supply would, however, be wholly inadequate, were not the plant so remarkably prolific, and possessed of such extraordinary nutritious properties. With the addition of a little barley, it is found to keep mules in the best working condition; and consequently the owner of one of these alfalfa haciendas is able to draw from his estates a much larger revenue than if cultivated in grain. In its green state, cattle feed upon it with the utmost avidity, and acquire flesh so fast, that it is the practice in Chili to drive herds from the grass pastures of the south, for hundreds of miles, in order to obtain the benefit of its use. The land is prepared for the seed of this plant in the same manner as for clover, it being, in truth, of the same family as the latter."

An idea may be formed of the extent to which mining operations were formerly carried on here from the immense heaps of *scoria* and dross which lie about the city, and particularly near the bed of the creek, as it is approached from the north. So imperfectly has the silver been extracted from this ore, that a regular business is now carried on in working the scoria over again, which is said to pay.

The high table-land, which forms the larger portion of the State, is not adapted to agriculture; but for grazing and the rearing of large herds of cattle, horses, and sheep, it is unsurpassed. I have heard it stated, that a man who settled near the Casas Grandes River in 1785, took with him four cows and a bull, from which, in the year 1829 he had become possessor of a herd of forty thousand cattle. The vast plains filled with such numbers of cattle resemble the prairies with their herds of buffaloes. The proprietors of the great haciendas used to pride themselves on preserving a uniformity in the color of their cattle, much as some of the nobility do in England at the present day, though on a grander scale; so that one possessed his thousands of purely black cattle, another white, and a third red. But this is now all done away with: the great herds have disappeared, and there is no longer any safety in rearing them, although the incentive to do so is greater, owing to the demand for the California market.

The arable lands are in the valleys leading to the great *Sierra Madre*, and along the water-courses. They are extremely productive.

Among the peculiarities of this place it is proper

to notice a singular breed of diminutive dogs which are found only here, and are eagerly sought for by strangers who visit the place. How these little creatures originated I was not able to learn, although I made many inquiries. These dogs have not the shape of common lap-dogs, or of the stunted, dwarfish curs, with large bodies and short legs, which are of common occurrence; but they possess the elegant form of a full-grown mastiff, with small heads, and slender and delicate limbs and bodies. The hair is short and fine on their backs, while on the lower part of their bodies it is little more than down. The forehead is remarkably prominent, and the eyes large and full. They are also noted for their sagacity. These dogs are highly prized throughout Mexico, and readily command fifty dollars at the capital. In Chihuahua they bring from five dollars to a doubloon (sixteen dollars) each, according to the purity of the breed. Several were brought home by the gentlemen of the Commission. I have two, which weigh respectively three pounds six ounces and four pounds.*

Many persons mistake these Chihuahua dogs for the misnamed prairie-dog, a little animal of the marmot species, about which so much has been said by all who traverse the prairies. Even intelligent travellers who have not seen both have fallen into this error.†

* The bitch has given birth to young twice since they have been in the United States, which attained a size and weight about four times that of the mother. The form was the same. This result has been noticed by others, who have attempted to introduce the breed into this country.

† Lieut. Hardy says, "The surrounding country is filled with rat-

holes as well as excavations, made by a very small species of dog, not much larger than a full-grown rat, who, as the traveller passes, comes out to the mouth of the cave, and barks most angrily at the interruption. I endeavored to catch one; but they are too wary, and instantly enter their holes when pursued. They are known in Mexico by the name of 'Chihuahua dogs.'—*Travels in Mexico*, p. 446. Had the Lieutenant taken the trouble to ask for the Chihuahua dogs when in the city, he would have found them to be the the most gentle and affectionate little creatures, and that instead of living in "caves" or holes, they spent their time chiefly on people's laps. Of the *prairie-dog* I shall speak hereafter.

Aqueduct and Church of Santa Rita, Chihuahua.

CHAPTER XL.

CHIHUAHUA TO THE RIO FLORIDO.

Departure from Chihuahua—Additional escort—Mr. Flotte with his family join us—Bachimba—Santa Cruz—Grist mill—Smelting works—Saucillo—Attack of the Comanches—La Cruz—Las Garzas—Ford the Conchas—Santa Rosalia—Its defences erected against the Americans during the war—Ramada—Rio Florido—Guajuquilla—Fertile valley—Monument to our Lady of Guadalupe—Search for meteorites—Hacienda Blanca—Wagon upset in an acequia—Hacienda de Concepcion—Curious mass of meteoric iron—Account of meteorites in the vicinity—Hacienda del Rio Florido.

November 1st. The wagons being repaired, and our loss of animals made good by the purchase of additional ones, we were this day enabled to resume our journey. We had added to our party six men, five as an additional guard for our animals, and a blacksmith. General Trias also furnished us with an escort of ten dragoons. Our party was further increased by the addition of Mr. Lewis Flotte (a gentleman to whom I have repeatedly alluded), who, with his wife, a Mexican lady, and eight children, were to accompany us as far as the Rio Grande, or even to the Gulf of Mexico. He had three carriages and four men, all well armed; and, as he had had considerable experience in Indian

warfare, we considered him an accession to our strength. A large train of wagons was to leave in a couple of days; but as the number of men with it was small in proportion, it would be of no advantage to us, while it might cause delays. So I preferred starting by ourselves.

All accounts received from the south brought the unpleasant news, that for six hundred miles the road was infested by the Comanches in large bodies, and well armed, and that they had committed greater depredations than ever, attacking not only travellers but villages in open day.

We did not get off until one o'clock, so that our day's journey was necessarily short. We made, however, twelve miles over a good road. On leaving the city, we passed the base of a mountain four miles distant, when we again emerged into an open plain. It was nearly dark when we reached a pond, about half a mile from the road on our right, where we encamped. Around this pond the earth had been banked up to the height of five or six feet, in order that a larger quantity of water might be retained. The grass was good. In a valley a mile distant on our right, was a large hacienda.

November 2d. About six miles after leaving, we entered a cañon, through which we continued for four or five miles the road quite stony and rough. In this is the dry bed of a stream, which, during the rainy season, is filled with water; and, judging from the appearance of the bushes and drift wood, must quite recently have been much swollen. East of this defile, the mountains which here cross the valley rise abruptly, and

present quite a picturesque appearance. Rocky strata of various colors are seen, and the summits of the hills are crowned with masses resembling works of art. About half way through, on the right, is a fine spring, and near by a deserted rancho, now in a state of ruin. What object any one could have in occupying such a spot, I cannot imagine; for there seemed to be no land fit for cultivation or for grazing. In this cañon is a conical hill, around which winds a spiral road, and on whose summit is a stone parapet, the work of some ancient people.

A little further on, we passed another rancho; from the top of the parapet peeped a few heads, and in their midst a huge blunderbuss mounted on a swivel, probably to overawe the Indians. On emerging from the cañon, we entered a broad plain, extending to the south as far as the eye could reach. A few isolated hills were alone seen in the far distance. The plain here was about twenty-five miles wide. Five or six miles further brought us to *Bachimba*, a cluster of about a dozen houses, with a fine spring of water, which is retained in a pond by a wall below it. From this, the water is conducted to some gardens, in which I noticed many fig-trees. This place is noted for its fine apples; but we were unable to procure any to satisfy us of the truth of the report. Here we encamped, after a march of twenty miles.

November 3d. A train of wagons from Chihuahua, belonging to Señor Olivares, joined us last night, and left again before daylight. We continued our journey over the same plain as before, in a direction about south south-east, the road being excellent. Grass

was scant, the plain being of a desert-like character, covered with low mezquit bushes, various kinds of cacti, yucca, and the fouquiera; forming as formidable a collection of thorny plants as one need wish to make his way through. No better indication of the desert character of a country is required than the fouquiera, which thrives only in the most barren and arid spots.

Ten miles from Bachimba the road divides, one branch leading south-east to San Pablo, which is the most direct, and the other to Santa Cruz, ten miles distant. We took the latter, in order to obtain a supply of flour there for our journey. This town stands near the San Pedro Creek, a tributary of the Conchos River, and extends for nearly a mile along the valley. Parts of it are compactly built; yet I did not observe a good-looking house in it. Men, women, and children crowded to the doors as we passed, attracted by the cracking of the whips and yells of the teamsters, and seemed to eye us with as much curiosity as though they had never seen a train before. It is said to contain four or five thousand inhabitants. We passed directly through without stopping, and crossed the creek, a fine stream of clear water, which rises in the mountains about one hundred miles to the west, when we were suddenly brought to a stand by a dilapidated bridge, across an acequia. Such was the condition of this bridge, that even the riding animals would not cross it. We had, therefore, to cut branches from the cotton-wood trees, lay them on the bridge, and cover the whole with earth, before we could make it passable. Such a bridge on the great highway from

the capital to the larger towns at the south and to the city of Mexico, is a disgrace to the State, and more so to the town within half a mile of it. A few hours' labor would render it safe and permanent; yet no one will do it. Each train managed to get over as we did, and appearances indicated that it had long been in the same plight.

Encamped at a village a mile from the stream, near the grist-mill where we were to obtain our flour. I had letters of introduction to the owner, but he was absent. He is a gentleman of much enterprise, having at this place, in addition to his flouring mill, a cotton gin and smelting furnace. The ore is brought from a mine ten miles distant. There is no wood near, and the furnaces have to be supplied with fuel by digging up the roots of the mezquit chapporal. Heaps of this lay by the road side, from which it is carried on the backs of donkeys or men to the furnaces. I learned that the mine was not profitable, but that another had been discovered, which was to be worked by the same person, who would bring the ore here to be reduced.

November 4th. Taking an easterly course, we struck the main road from San Pablo in four or five miles after setting out, when we again turned south-east. The road was good, with the same barren plain as yesterday. A tire here fell from one of the wagon wheels, notwithstanding the thorough overhauling they had received at Chihuahua; but such is the dryness of the climate, that these accidents will occur in spite of every precaution. The result was a detention of two hours, to wedge up the tire; after which we pushed on more rapidly, and reached *Saucillo*, said to be twenty-three

miles from Santa Cruz, where we encamped, about one hundred and fifty yards from the river Conchos.

As we entered the village, which consists of a cluster of mud houses, mostly in a decaying state, we noticed the whole population running to and fro in a great state of alarm, and at the same time a train of wagons entering from the south. We soon learned the cause of the excitement. The town had been entered an hour before by a band of Comanche Indians; who attempted to drive off the cattle. They were pursued by the men of the place, and in retreating, lanced an unarmed man who was driving cattle. Each of these fiends, out of mere sport, plunged his lance into the poor creature, as they passed him lying on the ground. The people were just bringing in his dead body. The Indians had also attacked the train that was entering, and succeeded in causing a stampede among the loose animals, fifteen in number, which they drove off. To save the rest, the party returned to Saucillo, which they had just left. This was the train of Señor Olivares, which had proposed joining us at Chihuahua.

In their attack to-day, the Indians killed eighteen head of beef-cattle, which they could not drive off. The bodies of eight of these were secured by the villagers; from which we obtained a supply of beef. Such is the course pursued by the Indians. When they cannot carry off cattle, they destroy them; and even when they want food, they do not kill and preserve their meat as the Mexicans do, but take merely what they want for a meal, and leave the remainder. Hence, the immense destruction of beef cattle and mules. A band of one hundred Indians destroy cattle enough to sub-

sist ten or twenty times that number ; and as they raise none themselves, it may be conceived what inroads they make upon the herds of the Mexicans.

While we were at Chihuahua, the Comanches made a great haul near this place. A large train of wagons, with one hundred and forty mules, on its way from the capital to the fair of San Juan, had just encamped, taken the mules from the wagons, and sent them with four men to a pool of water a quarter of a mile distant. While there a band of Comanches, who lay concealed with their horses in a bush near by, suddenly rushed upon them, stampeded the whole caballada, and succeeded in driving every animal off. The herders and teamsters in charge could do nothing to save them. The owner raised a large party a day or two after, took the trail, and was in pursuit of the robbers when we passed along.

A large portion of the population of Saucillo are miners who work on their own account, called *gambucinos*. These men perambulate the mining regions much as our Californians do in "prospecting," when they occasionally stumble on a vein which rewards them for their labors. This, however, is but seldom ; for, possessing no scientific and but little practical knowledge, their discoveries are almost purely accidental. Around the village are heaps of scoriæ, refuse ore, and broken furnaces, the results of the labors of these silver hunters.

November 5th. Before starting this morning, all the fire-arms were inspected, and a further supply of ammunition served out. I placed the party under the orders of Mr. Radziminski, chief engineer, who had

had experience as a military officer. The villagers, who knew the haunts of the Indians, said they were then near our camp, and although we did not see them they had their spies watching our movements. A man was now placed by the leading mules of each team in addition to the teamster, to keep them in place; as our safety depended on the preservation of our animals. Five of the soldiers were also placed with the wagons, and five about fifty yards in advance of the train. The remainder of the party were equally divided between the front and rear.

Our course for the first four miles lay through a thick chapporal, where an enemy might easily lie in ambush and surprise a party. It was, therefore, with some anxiety that we passed this place. On our left, for a mile or more, were ruins of decayed buildings; which led me to believe that the town must have been much larger in former times. Several large acequias, now destitute of water, crossed our road, another evidence that more of the valley had once been cultivated.

Passed some isolated mountains on our left, where there are some silver mines, the ore from which is taken to Saucillo to be smelted; but, whether owing to the poorness of the ore, or defective methods of separating the metal from it, they barely pay the expense of working. There are other mines in the hills to the right which yield more, and are considered profitable. These also belong to Saucillo, or rather to the gambucinos of that place.

About fifteen miles from Saucillo we reached by a gradual ascent the summit of a plateau, when a broad expanse of plain again opened before us. From here

we could trace the course of the Conchos by the wood along its banks. This, next to the Rio Grande, is the largest river in the State. It has its rise high up in the Sierra Madre; it first flows in a southerly, next in an easterly, then in a north-easterly, and finally in a northerly course, when it discharges itself into the Rio Grande near the Presidio del Norte. Its principal tributaries are the Florido, De Buenavista, San Pedro, Chihuahua, and Balleza. These, with their lesser branches, water more than a third of the State. The Conchos itself has a course of one hundred and forty leagues, or about three hundred and seventy miles.

In eighteen miles we reached *La Cruz*, a small village of three hundred inhabitants, and about five miles further *Las Garzas*, both on the river Conchos. The bottom lands are here broad, and seemed to be highly cultivated. Large haciendas appeared from among thick groves of cotton-woods, and exhibited quite an agreeable spectacle, after several days' travel over barren districts. After passing *Las Garzas*, we forded the Conchos, here a fine clear and rapid stream about two hundred yards across. After a day's journey of thirty miles, we reached *Santa Rosalia*, and encamped on the banks of the *Rio Florido*, a small stream which enters the Conchos at this place.

Santa Rosalia is the most considerable town we had met with since leaving Chihuahua, having almost five thousand inhabitants. It stands on a spur of the plateau in the angle formed by the Conchos and Florido Rivers, about sixty or eighty feet above the valley. Like all Mexican towns we had thus far seen, it is on the decline. There is rather a fine church here in the

course of erection, built of adobe, except the doorways and windows, which are of the soft sand-stone of the country. Some of the arches which are to support the roof are already finished, and are well built. To raise these arches, the intermediate spaces are built up with adobe and a few timbers, and the arch laid directly on this wall. When the arch is completed, the adobe is removed. This seems a quicker and less expensive mode than to use a framework, as we do.

South of the town are a redoubt and fort erected by the Mexicans when they expected an invasion from General Wool, who they heard was approaching in that direction. These works are all of adobe, and are said to answer well, as a cannon ball will pass through them without making a breach. But the invasion came from the north; and Colonel Doniphan was so uncivil as to give them no opportunity to use their defences, but approached where there were none; so that the labor of the Santa Rosalians was thrown away.

November 6th. We were detained several hours this morning to set the tires on two of our wagons, which gave me an opportunity to look about the town. Elevated above the plain, I could see for a long distance the valleys of the streams which unite here; they seemed to be quite broad, presenting a fine bottom for cultivation.

We heard from the people here, that a large band of Comanches crossed the Conchos early this morning near Las Garzas, and went towards the mountains on our left; evidently, with the intention of going southwardly towards the settlements, and perhaps of lying in ambush for passing trains.

At 1 o'clock P. M. we again got off, and, ascending

the plateau, struck across it in a direction east south-east over a desert plain, with an excellent road. About five miles off on our left, we saw the course of the Rio Florido. It was an hour after dark before we reached the village of *Ramada*, twenty-three miles distant, on that stream. This is a place of four hundred inhabitants, and contains, along with its tumble-down tenements, a crumbling church. In this last, are some pretty good paintings, but they are suffering much from neglect; for the people are so indolent, that they will not lift a hand, even for a few hours, to fill up the crevices in the decaying walls, to save these once valuable pictures from destruction.

November 7th. Leaving the valley of the Rio Florido, our course lay south across the plateau, here elevated not more than ten or fifteen feet above the bottom land, which we followed for several hours. Saw several large haciendas along the river with cattle grazing near. We had hoped to reach Guajuquilla to-day; but found it best to encamp at a well about twenty miles from Ramada, as we could not reach that place till after dark. Experience had taught us not to travel after nightfall when we could avoid it. On reaching these towns or haciendas, we required feed for our animals, which was generally corn-stalks; and unless we made arrangements an hour or two before dark, it could not be obtained. There are other difficulties in approaching these towns after dark, such as the acequias and broken bridges, the difficulty of selecting proper places to encamp in, etc. Where we had to depend on ourselves alone, and were in an unsettled country, it made no difference.

We obtained water at a well here, for which we had to pay three cents a head for our animals. There was a large hacienda near, the people of which seemed to have no other means of living than what they obtained from this tax on their water. This is not an unusual practice where wells have been sunk at a great expense, and where men are kept to protect them. This was formerly a large stock estate; but being far from any town, its cattle have all been stolen by the Indians.

The plain is here about twenty-five miles wide, being limited by ranges of mountains that distance apart. At the south, no mountains were visible.

November 8th. Twelve miles brought us to the old town of *Guajuquilla* (pronounced Wa-hu-ke-yah). It is also known as *Jimenes* (after the patriot of that name) on the maps; but in no instance did I hear it called by any other than its primitive Indian title. This town is situated near the river Florido, and is the cleanest looking place we had thus far seen in the State, the capital only excepted. Its population is about seven thousand; but for so large a place, it shows very little activity, there being but three or four small shops, containing altogether less goods than would be found in a village store in the United States, where the population did not exceed one thousand. It is altogether an agricultural town, being in the midst of a broad and fertile valley extending along both sides of the river. As it is off the main road, few travellers pass through it. Our little train, therefore, conducted by about forty armed men, brought out to their doors the occupants of the houses in the streets through which we passed. The people were more fair and

cleanly-looking than usual, and exhibited less of the Indian physiognomy and complexion. Having more wagon tires to set, and some blacksmith's work to do, we took occasion to look about the place, and found the people polite and desirous to serve us. Corn, barley, vegetables, eggs, and poultry, were brought to our camp for sale, for the first time since we entered the country.

South of the town is a small monument built of adobe to the height of about twenty-five feet, in honor of Our Lady of Guadalupe, whose full length portrait, or effigy, stuck into a frame, is inserted in a niche at the top of the monument. The picture is about two feet in length, and appeared to be an ordinary colored lithograph. The monument is an unshapely affair; and seemed to be fashioned in literal obedience to the command, not to make to oneself "the likeness of any thing in the heavens above, or in the earth beneath, or in the waters under the earth." It is but fair to add, that I was told the monument was built by a priest, who died before he completed his plans.

The river Florido has here a bottom of three or four miles in width; most of it is cultivated, and a considerable portion in cotton, which thrives well here. In fact, there is more land here under cultivation than at any place I had seen in the country, not excepting the valley of the Rio Grande. As an evidence of its secluded position, I was told that there were but two foreigners in it, a Spaniard and a Frenchman, both of whom honored us with visits.

November 9th. In consequence of the deficiency of tools, we made slow progress in repairing our wagons. We had heard at Chihuahua of the existence of large

masses of native iron, or *meteorites*, in this part of the State; and we made inquiries respecting them as we came along. We were here told that they were to be found about six leagues distant. Dr. Webb determined to avail himself of our detention to examine these masses. He accordingly procured a guide in the town, who professed to know where the objects of his inquiry were to be found; and taking with him our ten soldiers and three others of our party, he set off from camp. He expected, from the information given him, that he could reach the place in a few hours, and be back early in the morning.

Colonel Doniphan, with the army of the west, left this place for Parras by the *Bolson de Mapimi*. As that district of country is now in possession of the Comanches and Lipans, who are there some thousands strong, it is not considered safe for parties of less than one or two hundred to attempt it. We avoided it entirely by keeping to the west, though it made the route full three days longer.*

November 10th. Dr. Webb returned this morning without having found the object of his search. It appeared that on reaching the place designated, the guide became somewhat confused; and on being questioned

* I take this occasion to express my acknowledgment to *Dr. Wislizenus*, whose "Memoir of a tour through Northern Mexico, connected with Colonel Doniphan's Expedition, in 1846-47," has been of great service to me, and was my only guide from Chihuahua to Guajuquilla—and again after leaving Parras. I have great pleasure in testifying to the accuracy of this memoir, which is a model of its kind; and I do not hesitate to say, that no official report has ever been published by our government, which, in the same space, embraces so much and such accurate information.

more closely, the fellow acknowledged that he had not been there in twenty years, and had forgotten their precise locality. He also pretended to be much alarmed on account of the Indians, and declared that it was not safe to go further. The Doctor, however, compelled him to lead them about for miles in every direction, but to no purpose.

In the afternoon we resumed our journey, intending to reach *Totonilco*, about ten miles distant; but we had not proceeded far before we found the road overflowed by the bursting of an acequia which ran by its side. The wagons sank deep in the mud, rendering it extremely difficult to get along. On both sides of the road were hedge fences, so that we could not turn out. Mr. Flotte's large carriage got mired; and in the struggle to extricate it, the tongue and hounds were broken. In consequence of this delay, night overtook us before we had completed our day's journey, and rendered it difficult to find our way. Finally, in crossing a bridge over a large acequia near the *Hacienda Blanca*, our large provision wagon, "the ark," broke through a hole, which was not perceived by those in advance, upset, and precipitated its contents into the water. This accident was a serious one, as the vehicle contained all our provisions for forty days. There was no alternative, therefore, but to stop where we were, directly in the road, closely hemmed in with mezquit bushes. Our men were obliged to jump into the water, which was three feet deep and about fifteen wide. Many things sank to the bottom. Our flour, which was in sacks, sugar, coffee, rice, etc., were thoroughly wet.

November 11th. Our provisions were spread out in the sun to-day on India rubber blankets and tent-cloths. The result of the disaster was the loss of all our sugar, and about one third of the flour. After a few hours' drying, the coffee and rice were stowed away for a further drying in the afternoon, and we again set off. Finding that Totonilco was not on our direct road, we here took another, leading to the village of *La Zapata* (The Shoe), eighteen miles distant, which we reached before sunset, and encamped.

November 12th. Our next stopping place was the *Hacienda del Rio Florido*, about fifteen miles distant; but having heard of a remarkable meteorite at the *Hacienda de Concepcion*, about six miles from the direct route, I determined to let the train pass on, while I with a small party took the *Concepcion* road. Dr. Webb, Messrs. Radziminski, Seaton, Jacobs, and Force, with myself, made the party. Ten miles from Zapata, across the table-land, brought us to a small stream, where, encompassed in a grove of cotton-woods, lay the pretty village to which we were destined.

On our arrival, we stopped under the shade of some large trees, and dismounting at once discovered the object of our search about fifty yards distant, at the corner of a large building. This was the residence of Don Juan Urquida, the proprietor of the hacienda and large estates adjoining, and formerly governor of the State. That no time might be lost, Dr. Webb immediately set to work with his hammers and cold chisels to cut off some pieces from the huge mass of iron before us. This he found to be an undertaking

of great labor, in consequence of the extreme tenacity and hardness of the mass. After an hour's work, with a man to assist him, he succeeded in cutting off three or four small pieces, which did not altogether weigh an ounce, and were barely sufficient for an analysis. Five chisels having been broken, the Doctor had to desist from his labors, much to our regret, as we were desirous to obtain some specimens for cabinets.

While this was going on, I took a couple of sketches of the mass, showing opposite sides, and also took measurements; but the form was so irregular that these measurements can only aid in conveying an idea approximately of its bulk. Its greatest height is forty-six inches; greatest breadth thirty-seven inches; circumference in thickest part eight feet three inches. Its weight, as given me by Señor Urquida, is thirty-eight quintals, two arrobas, three libras, which, at one hundred pounds to the arroba, would be equivalent to three thousand eight hundred and fifty-three pounds.

This meteorite is very irregular in form, as the drawing shows; and one side is filled with deep cavities, generally round, and of various dimensions. These cavities were doubtless formed when the mass was cooling. At its lower part, as it now stands, is a projecting leg, quite similar to the one on the meteorite we saw at Tucson, and which I have described. The back or broadest part is less jagged than the other portions, and contains fewer cavities, yet, like the rest, is very irregular.*

* From the various inquiries made at Guajuquilla and at the Haci-

While we were at work, Señor Urquida, the younger, the brother of Don Juan, came out. Having no letters of introduction to him, I showed him a gene-

enda de Concepcion, I learned of the existence of meteorites, or masses of native iron, in several places. Of those near the former place, of which Dr. Webb went in search, there is no doubt. Some of them are very large masses, partially buried in the earth; while others are less than the one described. There is one at San Gregorio, about fifteen leagues distant; and it is reasonable to suppose from their proximity, that these several masses fell to the earth on the bursting of one and the same meteor.

For the information of such of my readers as are not familiar with the history of these phenomena, I will observe, in the words of a distinguished philosopher, that "Shooting stars, fire-balls, and meteoric stones, are regarded with great probability, as small masses moving with planetary velocity, and revolving in obedience to the laws of general gravity in conic sections around the sun. When these masses meet the earth in their course, and are attracted by it, they enter within the limits of our atmosphere in a luminous condition, and frequently let fall more or less strongly heated stony fragments, covered with a shining black crust."* Another distinguished writer, *Kaemtz*,† after examining the several hypotheses, for the origin of these igneous meteors, arrives at similar conclusions to those of Baron Humboldt. "A great number of observations," he says, "prove that, besides the large celestial bodies, there are small ones that move in space, such as points and luminous trains, which astronomers have often seen traversing the field of their telescopes. These millions of asteroids moving round the sun, become visible when they are ignited by entering the terrestrial atmosphere."

With regard to the masses of meteoric iron, many instances are recorded where they have been known to fall to the earth on the bursting of meteors, and have been carefully examined and analyzed by philosophers. They present the same character, both in form and in their chemical composition; metallic iron predominating, with a few parts of nickel. "The connection of meteoric stones," says Humboldt,‡ "with

* Humboldt's *Cosmos*. Vol. i. p. 98. Otto's translation. London ed.

† *Meteorology*. pp. 473-79.

‡ *Ibid.* p. 101.

ral letter which General Trias had given me to all officials on my route, directing them to extend to me and my party every facility in the prosecution of our

the grander phenomenon of fire-balls—the former being known to be projected from the latter with such force as to penetrate from ten to fifteen feet into the earth—has been proved, among many other instances, in the fall of aerolites at Barbatan, in the Department of Landes (24th of July, 1790), at Siena (16th of June, 1794), at Weston, in Connecticut (14th of December, 1807), and at Juvenas, in the Department of Ardeche (15th June, 1821). Meteoric stones are sometimes thrown from dark clouds suddenly formed in a clear sky, and fall with a noise resembling thunder. Whole districts have occasionally been covered with thousands of fragmentary masses, of uniform character but unequal magnitude, that have been hurled from one of those moving clouds. The great meteoric mass which fell in Siberia in 1771, described by Pallas, was regarded by the Tartars as a sacred object fallen from heaven. Analogous masses have been found in Bohemia, Hungary, the Cape of Good Hope, Mexico, Peru, Senegal, Baffin's Bay, etc. The iron is full of cavities, filled with more or less perfect crystals of olivine; when these crystals are removed, the residue still contains 90 per cent. of iron, a certain percentage of nickel, and the rest needs scarcely to be taken into account.”*

Of the meteoric masses found in Mexico, Baron Humboldt gives the following account. “In the environs of Durango, is found the enormous mass of malleable iron and nickel, which is of the identical composition of the aerolites which fell in Hungary, in 1751. This mass is affirmed to weigh upwards of 1900 myriogrammes (41,933 pounds). Another mass was discovered in Zacatecas, of the weight of 97 myriogrammes (2140 pounds).” The exterior character of this was found by him to be entirely analogous to the malleable iron described by Pallas.†

A collection of meteorites has been made by Professor Shepard, of Amherst College, which is already said to embrace two hundred specimens from more than a hundred different localities. Among them is one from Newberry, South Carolina, weighing 58 pounds. Another mass

* Kaemtz. *Meteorology*, p. 476.

† Political Essay on New Spain. Vol. ii. p. 293. London ed.

journey to Matamoras. This gentleman was very polite to us, and readily answered our numerous inquiries about the mass of iron. He said it was originally

of malleable iron weighing nine pounds, was found in November, 1852, in digging a ditch near Cayuga Bridge, on Seneca River, N. Y. It measured four inches in diameter and seven inches in length: and what adds to the interest of this, is the fact that but a few miles from where it was found, a meteorite fell in 1827.*

There is another interesting account of the discovery of a meteorite in the town of Charlotte, North Carolina. In this case a whizzing noise was heard in the air by several persons, accompanied by a commotion in the atmosphere, and the next moment a stone struck near them, "with a dull heavy jar of the ground." On examination, the meteoric mass referred to was discovered. The people of the town were alarmed by "a sudden explosion, followed at short intervals by two other reports, and by a rumbling in the air. The sounds were distinct, and continued for more than half a minute." This meteor was seen through 250 miles.†

It is to be hoped that Professor Shepard, into whose hands this meteorite has been placed, will give the scientific world the results of his extensive study of these most interesting phenomena.

Before closing this note, I will remark, that early in the evening of the 1st of June, the day we left San Isabel in California, a brilliant meteor was seen by us all, passing from west to east. Another which surpassed in brilliancy, in the size of its mass, the length of its fiery train, and the time of its duration any that I ever witnessed, was seen about 8 o'clock in the morning, between the 15th and 20th October, 1852. This occurred a few days before we reached Chihuahua, and passed from west to east over two thirds of the horizon, at the south. On reaching Ringgold Barracks, near Camargo, a few weeks after, Major Paul, the commanding officer at that post, informed me that he saw the same meteor, which passed to the north of them, and heard it explode. As it doubtless dropped on the open, woodless plains of Texas, which are now so much traversed, it is to be hoped that the masses which then fell may be discovered.

* Silliman's Journal, for Nov. 1852.

† Id. Jan. 1850.

found about three hundred varas (two hundred and seventy yards) from its present location, and had been moved at different periods by the people of the hacienda to the place where it now stands. It was brought hither with the design of putting it in a blacksmith's shop, to be used as an anvil, although it had never been so employed. An attempt was made to reduce it, by building a large fire around it, and heating it to a white heat. But so intense was the heat from so large a mass, that the workmen could not approach it, and all their labor was lost. The expense of this operation was more than one hundred dollars, and resulted in obtaining a piece of the metal large enough to work into a pair of spurs.

On the top, which is quite smooth, is an inscription bearing the date 1600; but I was unable to make out a single word of it, so much has it been defaced by hammering and the addition of many crosses. It is said that the inscription gave some account of its removal.

Señor Urquida invited us into his house, to give us the particulars of the weight of the mass as estimated by his brother. We accepted his invitation, and were conducted into a very handsome suite of apartments. Here we met several gentlemen, all of whom were of the higher class, extremely affable in their manners, and in their conversation showing much intelligence. Every thing within and around indicated an air of comfort such as I had seen in no part of the country, save in two or three houses in the capital. A library of well-selected books in Spanish, French, and English, some fine pictures, a piano, etc., showed

the occupants to possess cultivated minds, as well as taste. Our gentlemanly host very politely invited us to remain to breakfast;* but we were obliged to excuse ourselves, on the ground that we had breakfasted before leaving, and that it was necessary to rejoin our party on the Rio Florido without delay.

Taking leave of our polite friends, we pursued our journey across the plateau, and reached the Hacienda del Rio Florido, nine miles distant, at three o'clock, where we found the party already encamped.

Several mules were taken sick to-day in consequence of the greenness of the corn (maize) they had eaten; and one of them died, notwithstanding every effort to save him.

This place consists of a large hacienda with a colonnade of stone, the capitals of the columns being in the Moorish style. It stands on the margin of the plateau, overlooking the valley of the river, and has a very picturesque appearance. Adjoining this building is a church, well constructed of stone, and of a better description than any we had seen since leaving Chihuahua. These buildings were erected by Juan Cérera, a Spanish priest, at which time it was considered one of the richest haciendas in Mexico. At his death it was divided among three of his nephews. A considerable village, with about a thousand inhabitants, now surrounds the hacienda. Twenty-six tolerably

* The usual hour for breakfast among the higher classes in Mexico is twelve o'clock. On rising in the morning a cup of coffee or chocolate only is taken, sometimes with the addition of a cracker. Dinner is taken about five, and supper at ten. Many take but two meals, the second one, answering for dinner and supper, at seven in the evening.

good paintings decorate the walls of the church ; and around the altar are full length portraits of the Saints, inclosed in a large and massive gilt frame, extending from the floor to the ceiling. In the centre is a statue of " Our Lady of Guadalupe," inclosed in glass.

CHAPTER XLI.

RIO FLORIDO TO PARRAS.

A mule kidnapped—La Noria—Cerro Gordo—Enter the State of Durango—Another escort—Miserable condition of the Mexican soldiers—Recent battle here with the Comanches—La Zarca—Vast herds of cattle and horses—Scarcity of wood—Droves of horses—San Pedro del Gallo—Rio Nasas—Fertile valley—Culture of cotton—Corn-fields without irrigation—La Noria de Pedrecina—Silver mines—Cuencame—Another escort of civilians—La Noria Cureña—Rio Buenaval—Pozo Calvo—Depredations of the Comanches—Alamo de Parras—Viesca mines—La Peña—Break down—Cold weather—El Pozo—Recent incursion of Indians—Reach Parras.

November 13th. When all was in readiness to start, one of our mules was missing. After hunting about for him for an hour or more, we set off, leaving an arriero to continue the search. A few hours after, the arriero overtook us with the missing animal, which he found concealed in the inner apartment of a house. A woman had fortunately witnessed the roguery of one of her countrymen as he slyly secreted the mule, and she informed the man who was searching for it.

We made fourteen miles to-day, reaching *La Noria* (The Draw-well) * at 2 o'clock ; but it was necessary

* *Noria* is properly a wheel or engine for drawing water from a
VOL. II.—30

to stop here, as we could not reach La Partida till after dark. I had determined to avoid night travel when it could possibly be avoided, as we had gained nothing by it. The roads are excellent, and we might go on for twenty miles without meeting a rock or gully; but the next moment we might disable the train by plunging into one of these places worn by the rain, or by upsetting in some shelving place. There are no bridges in the country, except over the acequias; and repairs are never made on the roads. If a flood washes a portion away, or it is otherwise rendered unsafe to travel, the place is simply avoided and a new route taken.

La Noria is merely a well with a large hacienda for the raising of cattle, but with no ground for tillage. As it is the only place between the Rio Florido and Cerro Gordo where there is a certainty of finding water, it is the general stopping-place for all passing trains. The table-land here consists of alternate patches of grass and chapporal, but enough of the former for many thousands of cattle.

November 14th. Having a long march before us, the camp was called at an early hour; and before the sun had shed his first rays upon us, we had breakfasted and were moving forwards. Our course lay over a broad plain with a superb road, not surpassed by the best wrought turnpike. To the east, the view was limited by a low range of hills about ten miles distant; while in other directions, neither hills nor mountains were visible. The plain was slightly undulating, with

well; the term is also applied to wells where wheels are so employed, to distinguish them from *pozos*, or common wells.

grass and mezquit bushes at intervals. In the lowest depressions where a little moisture had accumulated, the mezquit appeared in thick groves to the height of fifteen feet. At 4 P. M., we reached *Cerro Gordo*, twenty-six miles from our last camp.

This is a miserable old decaying town, containing less than six hundred souls; although when Lieut. Hardy passed here in 1828, he says there was a population of three thousand. From the present extent of the town, including its crumbling and unoccupied houses, it is evident that it has been much more populous than at present. It contains a modern built church without any pictures; there is no other object in the place worthy of notice. A small stream passes through it, and there is a very little arable land near. It was originally established as a military post, and is still maintained as such.

As we had now entered the State of Durango, it was necessary to surrender the escort given me at Chihuahua. I accordingly presented my letter from General Trias to the Comandante, and requested him to furnish me another escort through this State. He told me that the soldiers were at my service, but expressed his regrets that he had not the means of furnishing them with their subsistence even for the short march required, and that for nearly a month he had not been able to give them money enough to purchase their daily food. As their pay was but two and a half reals (31 cents) a day, and as this was the only difficulty, I at once offered to allow them this amount each, while they were with us, and the same for returning. The Comandante, a very polite and gentlemanly man, made

many apologies for his straitened circumstances; and he requested me to send him word, when the escort returned, how much I had paid them, together with my address, in order that he might refund me the money as soon as he should have it in his power.

About three months before our arrival, this place was attacked by a band of a hundred and fifty Comanches, and a large number of mules and cattle stolen. The soldiers turned out to rescue the animals; and a severe fight took place within a quarter of a mile of the town, resulting in the entire defeat of the Mexicans, with the loss of a Lieutenant Colonel and six other commissioned officers, together with thirty soldiers and a number of citizens.

November 15th. Our journey was continued over similar plains to those passed yesterday. Mountains were dimly seen at a great distance to the east. There was more grass and less chapporal. The road was very smooth. In an arroyo, fifteen miles distant, we found water, which enabled us to refresh our animals and push on, reaching the hacienda of *La Zarca* * after sunset, and making thirty-two miles.

This is now, as it ever has been, one of the largest cattle ranges in the State. The estate includes several villages, and has an extent of nearly a hundred miles. An hour or two before we reached it, we saw immense herds of cattle dotting the plain in every direction, luxuriating on the rich grass which here covers every portion of it. When Dr. Gregg was here, about twenty years ago, so great was the number of cattle on this

* *Zarca* is a term applied to water, and means clear and pure.

estate, that it was said, the proprietor had once offered to sell the whole establishment, simply for the consideration of fifty cents for each head of cattle found on it; but that no one could muster sufficient capital to take up the offer. Mr. Kendall,* who stopped here on his way to Mexico with the prisoners from the Santa Fe expedition, says, that when this estate was at the zenith of its prosperity, a regiment of dragoons arrived from Spain and landed at Tampico. This regiment was one thousand strong, and of course the men did not bring their horses with them. The Colonel happening to be a friend of the family of the proprietress, then a widow, she immediately sent him a thousand white horses as a present, for the use of his regiment. There was hardly a month's difference in the ages of these horses, and every one of them had been raised on her estate.

November 16th. The same open table-land continued to-day. On leaving, we descended gradually for about six miles, when we found good water in a laguna by the road side. We then ascended again to a higher level for about twelve miles, by an easy slope. The whole plain was here covered with grass, but entirely destitute even of the smallest bushes. An occasional cactus or yucca rose now and then, to break the monotony of the broad plains. Sometimes they appeared in groups, and at a distance resembled men on horseback or on foot. Often were scouts sent ahead to inspect these mysterious-looking objects.

Passed several large droves of horses, which rushed

* Narrative of the Texan Santa Fe Expedition. Vol. ii. p. 111.

across our path and galloped away at full speed as we drew near them. There were no herdsmen with them; and it was a matter of surprise to see such herds ten or fifteen miles from any habitation. The best of these horses may be purchased for fifty dollars each, and ordinary ones for from eighteen to twenty dollars. We filled our water kegs at the laguna, and, after making altogether about twenty-one miles, encamped in the open plain near some mezquit bushes, for the sake of the fuel they afforded. Wood had been the most difficult of all things to procure on our journey from El Paso. We gathered it from bushes as we came along; and we often, as was the case this day, were governed in fixing our camp by proximity to it.

November 17th. Our route to-day lay over and among low hills with a stony road, but kept gradually descending towards the valley where we expected to encamp. Towards noon, herds of cattle and *milpas* (corn-fields) indicated our approach to a settlement; and soon after, we rode into a town that glories in the extraordinary name of *San Pedro del Gallo* (St. Peter of the Cock). Miserable and filthy as were many of the towns we had visited, this surpassed them all. The plaza seemed to be used as a great cattle-pen, and the streets as avenues to it. There was a general staring at us as we entered the place. Driving through it, we encamped on a level piece of ground just beyond, where we were soon surrounded by a number of anxious inquirers. As an evidence of the poverty of the place, we could buy neither eggs, fowls, nor vegetables—nothing but *frijoles*, and corn for the animals.

The town is supplied with water from a natural

well, whence it is conducted into a long trough built of stone. Here the mules and cattle drank, the women did their washing, the people in general performed their ablutions, and got their supply of water to drink. By tapping the fountain near its source, we got pure water.*

November 18th. On leaving El Gallo (as it is often called for shortness) we entered some low hills, and soon after crossed a plain about twelve miles wide, when we reached a range of rocky hills with fantastic summits. Through defiles in these we passed, and entered a broad valley beyond, such as we had not

* Much as the people of the United States have been ridiculed on account of the singular names applied by them to places, those of Mexico are at least equally guilty in this respect. Every State has all the saints in the calendar applied to something; either a village, hacienda, or a rancho; and the *Guadalupes* and *Concepcions* are as common as our Washingtons and Franklins. The aboriginal names are, many of them, very pretty and sonorous, and these are often retained, but not without some holy prefix, generally the name of a saint, as though we were to say, *Saint Nicholas of Manhattan*, *Saint Peter of Passamaquoddy*, etc. In looking over a geographical dictionary I find the following, some of which occur as often as our *Adamses* and *Jeffersons*.

Nombre de Dios,	<i>The name of God.</i>
Madre de Dios,	<i>The Mother of God.</i>
Todos Santos,	<i>All Saints.</i>
Corpus Christi,	<i>Christ's Body.</i>
Trinidad,	<i>Trinity.</i>
Valgame Dios,	<i>God save me.</i>
Sacramento,	<i>Sacrament.</i>
La Purissima Concepcion,	<i>The most pure Conception.</i>
Dolores,	<i>Grief.</i>
Los Cinco Señores,	<i>The five lords.</i>
San Pedro del Boca Leones,	<i>Saint Peter of the Lion's mouth.</i>
Santa Cruz del Rosaria,	<i>The Holy Cross of the Rosary.</i>
Cieneguita de Jesus Maria,	<i>Jesus Mary's Little Swamp.</i>
La Santa Magdalena,	<i>The Holy Magdalen.</i>

seen since entering the country. For miles it was lined with villages and haciendas, while large cotton-wood trees, the usual accompaniments of water-courses, extended in a line as far as the eye could reach. Large fields of corn covered the bottom-lands, and every thing indicated a high state of cultivation. This was the Valley of the Rio Nasas, a beautiful stream about sixty yards in width that discharges itself into the Lake Cayman of the maps, but which is here known as the Laguna de Tlagualila, in the Bolson de Mapimi. Finding a rancho on its banks, where corn and a corral could be obtained, we encamped. Distance from El Gallo, twenty-five miles.

The valley here is from a mile to a mile and a half in width, and has long been noted for the excellent quality of the cotton raised in it. The climate is said to be very mild, and admirably adapted for its cultivation.

In our journey to-day, I noticed for the first time several large fields of maize on the high grounds, with no water near. The soil is excellent on these plains; and by planting the seed just before the rainy season, it comes to maturity rapidly; although the yield is less than when irrigation is employed, and the grain is of an inferior quality. The mezquit trees in this valley are larger than any seen on our route, being full twenty feet in height.

November 19th. Following the bank of the Rio Nasas for five or six miles, we kept on through several small villages and cultivated grounds, then turned suddenly to the east, and passed between two high hills with flat tops. After continuing about three

miles through a defile, we emerged into a broad plain, bounded on the east by a high range of mountains. This plain was about ten miles across; after it we passed a second range, and beyond this another plain of six or eight miles more, which brought us to *La Noria de Pedreceña*, a well with a wheel, distant twenty-seven miles from our starting place. Here is a church, apparently modern, with several furnaces for smelting silver ore. The town is surrounded by an adobe wall twelve feet high, outside of which are many houses in a state of decay. It has evidently been more populous than it is at present; for not half the houses seem to be occupied. All the water used by the inhabitants is taken from the well.

November 20th. While the teamsters were hitching up the mules, I rode to the town, and made a call on Don Tomas Pedreceña, the proprietor of the place. I found him an intelligent and gentlemanly man; and at my request he furnished us a series of specimens of the ore from his silver mines in the vicinity. The place was originally founded by his grandfather, and had descended to the gentleman we now saw, who, on coming into possession, had leased the estate. The lessees had for several years abandoned the working of the mines, and devoted themselves to working over the scoria and cinders which lay in the hillocks near the town, and from which they were able by some improved process to extract a considerable amount of the precious metal. Señor Pedreceña took possession himself about six months before our visit, finding the place was fast running down. With this revival it has quite an air of business. Don Tomas took us into the

church, which is in good condition, and is hung with pretty good pictures of a large size. An advantage in these pictures was, that the name of the subject was painted beneath each of them, a piece of information that would have been acceptable in the case of many others we had seen.

By the advice of our friend, we here left the direct road, which he informed us was rough and hilly, with some bad arroyos to cross, where wagons were often disabled, and took that to Cuencamé, about twenty miles distant, which we reached early in the afternoon.

Cuencamé, or *Quincamé*, was once a place of some importance, judging from its many well-built houses and churches. It has three of the latter, one of which, on the plaza, is quite an imposing edifice. The houses on the plaza are large, and plastered outside. The shops, of which there are many, are well filled with goods, and have a show of business.

As the escort furnished us at Cerro Gordo left us at La Noria, I called on the Prefect of Cuencamé with the letter of General Trias, and requested him to furnish me another to El Alamo de Parras, or the first military post in the State of Coahuila. He received me politely, and expressed a willingness to further my views as far as lay in his power. There were no soldiers in the place; but he agreed to procure for us seven reliable men, if I would allow them the usual pay of privates, and something extra for the corporal; an offer which I readily accepted. He could not furnish them animals to ride, as there were but few in the place.

Between here and Parras is the most dangerous

part of our whole route by reason of the Comanches. The great pass leading to the Bolson de Mapimi is here, through which the Indians enter that portion of Mexico. The little heaps of stones surmounted by crosses, where murders have been committed by the Indians, are met with at every mile; and having got along safe thus far, I did not feel disposed to risk the party and train, if an escort could be had.

The present population of Cuencamé is three thousand souls, as stated to me by the Prefect. It is a very old place, and the Franciscans formerly had a convent here. It stands on a small stream, barely sufficient to supply the wants of the people. There is no bottom-land near, which gives it a most dreary appearance. It is strictly a mining town, and has three smelting works in operation. We went into them, and procured specimens of the ores.

November 21st. We were detained several hours waiting for our escort, so that we did not get off until eleven o'clock. Our course was now east over a bad road. After going about ten miles, we stopped at a well called *La Noria Cureña*, an abandoned cattle hacienda, near which was good grass, but no arable land. The well is covered with a handsome octagonal building, having wheel-work inside for raising the water by mule power. In an adjoining building we found the leathern buckets, which we rigged with some difficulty by attaching them to a broad leather band which passed over a horizontal wheel, and thence down into the well. On one side these buckets went down empty, and on the other came up filled. The water then fell into a reservoir, whence it was led to the out-

side into a trough of stone about four feet wide and a hundred in length. Here the animals were watered, though it was with some difficulty we could get the timid mules to drink from such a respectable-looking affair. The Indians attacked this place shortly before our arrival, took every mule and head of cattle, and drove off the inhabitants; since which time it has been abandoned.

November 22d. The country had now become very hilly and rough, with bad roads. On descending a hill, a linch-pin was thrown from one of the wagons, letting the axle down with so much force, that the end of it was broken off and spoiled. Having some pieces of hard wood in the train, the end was cut off and a piece spliced on, a very difficult job, causing a detention of four hours. To ease this axle as much as possible, a portion of the load of this wagon was transferred to the others. We now proceeded cautiously, the road still winding among mountains, and at eight o'clock p. m. reached the river *Buena-val*, having made twenty-five miles. This is a small stream which rises in the State of Zacatecas, and, running north, empties into the Laguna de Parras, in the Bolson de Mapimi. It has no bottom-land where we crossed it; and hence is destitute of the cotton-wood trees which are so gratifying to the eye amid the general barrenness.

November 23d. My intention on leaving this morning was to go to the *Alamo de Parras*, about thirty-five miles distant; but an hour or two after we had started, our spliced axle-tree gave out, which compelled us to stop at the *Noria de Pozo Calvo*, a well similar to that of Cureña. On examination we found it necessary

to have a new axle, a want not readily supplied with our limited materials. It was, nevertheless, effected by making a false axle extending two thirds the length of the old one, to which it was fastened with pegs and raw hide. One wheel was consequently six inches further back than the other.

Near by were some fields of corn cultivated without irrigation, which looked very well. About a month before our visit, the Comanches made a descent here, took all the cattle (about forty head) and a number of mules, and killed three men who had them in charge. Only three men now remained at the hacienda, which they intended to abandon in a few days.

November 24th. Our march to-day was all the way over the hills, and through long narrow valleys separating high ridges of mountains. The road was stony and rough most of the way ; the remainder, a deep sandy loam. The dust raised by a strong wind, which blew directly behind us, so filled the air, that objects could not be seen twenty feet ahead. The wind drew through these defiles with great force, raising clouds of dust independent of that caused by the mules and wagons. This was the most disagreeable day's journey we had had, and the most tedious ; for we did not reach the *Alamo de Parras* till two hours after sunset, having made thirty miles.

Soon after our arrival, I called on the Alcalde of the town with the letter of General Trias, and made a request for an escort, as the men from Cuencamé had not engaged to go any further. He expressed a desire to serve us ; but having no troops, he said he could only

give us a guard of citizens, on my paying the customary charge. This I readily consented to, and requested that seven mounted men might be placed at my disposal. The Alcalde said it would not be possible for him to find men who would be ready to start in the morning, as it was then late. We were, therefore, obliged to remain over a day.

November 25th. This town consists of a street a mile or more in length, well lined on both sides with neat adobe buildings, most of which are colored or whitewashed. Some streets running at right angles contain a few houses. The plaza and church are quite ordinary and not in keeping with the rest of the town, which is altogether more cleanly and business-like than any we had seen since leaving Chihuahua. Ten leagues distant are the *Viesca* silver mines, the ore from which is smelted here. In my walks about the town and its vicinity, I observed more cultivated grounds than I had seen elsewhere. To the east is a level plain full ten miles wide, intersected with irrigating canals in every direction. Cotton is cultivated on this plain to a considerable extent, and is found to do well. I procured some samples of the product, a ready market for which is found at Saltillo.

November 26th. On the arrival of the citizen guard this morning, we again set out. Our course lay east over the plain mentioned yesterday, which did not contain a tree or a bush. On passing this we entered a mountain defile, and soon after reached the hacienda called La Peña (The Rock). This is simply a well with one large building and a cattle-pen, without any arable land. It formerly possessed large numbers of

cattle, which grazed on the plain; but no animals can now be kept there, on account of the Indians, who are complete masters of the country, notwithstanding the populous towns in every direction. We did not stop here, intending to reach El Pozo, three leagues further: but in passing the rocky defile, one of the wagons broke down, which made it impossible to proceed as it was. There was no alternative but to empty it of its contents, distribute them among the other wagons, and lock the disabled wheel. In this manner we reached *El Pozo* late in the evening. As we approached, our horsemen in advance were hailed from the walls; and by the time they came up, twenty armed men were at the gate to receive them.

We by this time found the nights very cold, which rendered it necessary to have fires to warm ourselves when fuel could be obtained. This night in particular was exceedingly cold.

El Pozo (The Deep Well) is a large hacienda inclosed with a wall full twenty feet high, resembling a castle or a prison; and is a noted resort for the Comanches and the Lipans, in passing to and from the Bolson de Mapimi, where they dwell. They pass every few days, and we were told that a large band stopped here but two days before. On that day they attacked a train of pack-mules and donkeys, and completely cut it up. The men with it were missing, and it was not known whether they had been killed, or had made their escape to the mountains. It was at this well that a band of Indians received a chastisement from a detachment from Colonel Doniphan's command, when

passing through here in 1847.* It is probable the Indians did not know who their antagonists were, but believed them to be Mexicans. I have been often told that they will not attack a party of Americans, when they know them to be such; as in their contests with them, they usually get the worst of it.

November 27th. On starting this morning, we found an addition of six or eight Mexicans, men and women, to our party, who were going to Parras. Our road wound around hills and across deep arroyos. Numer-

* "Two days before our arrival, a party of Lipan Indians, upon one of their predatory excursions, had stolen from a hacienda, near Parras, several hundred mules and horses, and killed several men. The proprietor, Don Manuel de Ibarra, applied to Captain Reid of our regiment (who was then ahead of us with Lieut. Col. Mitchell's party) for aid against these Indians. The Captain, one of the most gallant officers, took but eight men along, and, accompanied by the Don himself, went back to El Pozo, where the Indians, on their march to the mountains, had to pass. They had hid themselves in a corral, to await the arrival of the Indians. Quite unexpectedly, about twenty of our vanguard came very early this morning to El Pozo, and increased their party to thirty men. Soon afterwards the Indians appeared, from forty to fifty warriors. When our men rushed from the corral on horseback to attack them, the Indians (supposing them to be Mexicans) received them with sneering and very contemptuous provocations; and their confidence in their bows and arrows was increased, when the Americans, firing their rifles from horseback, killed none at the first charge. But as soon as our men alighted, and took good aim with their rifles, the Indians fell on all sides. Nevertheless, they fought most desperately, and did not retire till half of them were dead or wounded. But at last they had to run for their lives, and leave all their dead and all their booty behind. Besides their stolen stock, thirteen prisoners, Mexican women and children, whom they had carried along, were retaken, and released from the brutality of their savage masters. Fifteen Indians were lying dead on the field."—*Dr. Wislizenus's Memoir*, p. 71.

ous heaps of stones with crosses, together with many fresh graves by the road side, reminded us of the proximity of the savage and of the murders he had committed. On both sides of the road, three or four miles distant, ran chains of mountains. After a gradual ascent of ten miles, we saw beneath us a broad valley ; and upon the right of this, at the base of the mountains, lay the town of *Parras*. The whitened walls of its houses, its steeples, and the long rows and clusters of cotton-wood trees, presented an agreeable contrast to the bold rugged mountains in the back-ground. Until quite near the town, the plain is barren and not susceptible of cultivation.

It was after sunset when we entered the place, and we at once drove to a sort of caravanserai, which we entered with the whole train. The mules were placed in a corral adjoining. Four of us quartered ourselves in a small apartment in the court, the rest remained in tents.

CHAPTER XLII.

PARRAS TO SALTILLO.

Parras—Its vineyards—Numerous springs—Orchards—Plantations of the Agave—Extent of its cultivation—Pulque—Hacienda Arriba—Its extensive wine vaults and granaries—Visit to the churches—The Alameda—Departure from Parras—The Hacienda Abajo—Don Manuel de Ibarra and General Wool—Cienega Grande—Ceguín—Vequeria—Gigantic Yuccas—Hacienda de Patos—Don Jacobo Sanchez—His large estates—Claims for indemnification on the United States—Village of Peons—Encantada—Arrival of a courier with despatches from Washington—Buena Vista—The Barrancas—Ramble over the battlefield—Relics found—Reach Saltillo—No work on a feast day—Fine church—Cotton factories—Dr. Hewison—Economical use of water.

November 28th to December 1st. We remained at Parras five days, to repair our wagons. One wheel and an axle had to be made new throughout. The delay was longer than was needed for the work, in consequence of the loss of two days by the drunkenness of our most important mechanics. We had to submit quietly to this imposition, as no others could be found. The time passed heavily, as there was but little of interest in or about the town, and the sight-seeing was soon accomplished.

Parras is the best built town we had yet seen in the country. Many of the houses are of two stories, being quite spacious, with courts in the centre, and

built with much taste. They possess, too, a degree of comfort, and even luxury, not found in the modern houses of the country. It is an old settled place, and has always been noted for the excellence of its wine and brandy. A species of wild vine was found here by the first settlers, whence its name;* they also brought with them the *vites vinifera* of Asia, which flourished well. The extensive cultivation of the grape, for which the position of the town is admirably adapted, as well as the extent of arable land near, drew together a large and highly respectable population. Although now much reduced in their worldly means, there are many old families remaining, who possess all the dignity and elegance of manner which always characterized the native Spaniard.

The town extends for a couple of miles along the side of a hill. The smaller vineyards run along the declivity, the larger ones beyond the town, on the plain. The hill, which consists of a porous limestone, abounds in water, which is collected in tanks, and conducted by acequias through the vineyards and the principal streets of the town. Besides these acequias there are numerous wells; in fact, every house of any extent has its own well within its court. When the town has supplied itself, the remainder is conducted by aqueducts or ditches off to the plains, where it is all absorbed in irrigating, first, the gardens and vineyards, and beyond these the fields of wheat and maize. So admirable and economical a use of water I have never before seen.

* *Parra*, a vine trained on sticks, or nailed to a wall.

The town on the lower side is encompassed with gardens and orchards, in which we saw pomegranate, fig, pear, and other trees growing with great luxuriance. On the hill back of the town, I saw for the first time plantations of the *maguëy* (*agavé Americana*), the leaves of which were from six to seven feet in length. They are planted in rows, and surrounded by a hedge of the same, making a most formidable breast-work against both man and beast. It is from these plants that the *pulque* is made.* We had seen the

* The sap of the maguëy is obtained by making an incision in the central leaves or heart of the plant, which incision is converted into a kind of reservoir for the collection of the juice, by drawing the lateral leaves close together and tying their extremities.

“ This is the true vegetable spring, which keeps running for two or three months, and from which the Indian draws three or four times a day. We may judge of the quickness or slowness of the motion of the juice by the quantity of honey extracted from the maguëy at different times of the day. A foot commonly yields, in twenty-four hours, four cubic decimetres (or two hundred and forty-two cubic inches, English), equal to eight *quartillos*. Of this total quantity they obtain three *quartillos* at sunrise, two at mid-day, and three at six in the evening. A very vigorous plant sometimes yields fifteen *quartillos*, or four hundred and fifty-four cubic inches, English, per day, for from four to five months, which amounts to the enormous volume of more than eleven hundred cubic decimetres, or sixty-seven thousand one hundred and thirty cubic inches. This abundance of juice, produced by a single maguëy of scarcely a metre and a half in height, or four and nine tenths feet, is so much more astonishing, as the agave plantations are in the most arid grounds, and frequently on banks of rocks hardly covered with vegetable earth. In a barren soil, the Indian calculates the product of each maguëy at one hundred and fifty bottles, and the value of the *pulque* furnished in a day at from ten to twelve sols. The produce is unequal, like that of the vine, which varies very much in its quantity of grapes.

maguey growing wild throughout the desert plains of Chihuahua, Sonora, and California; but nowhere does it attain the size which it reaches in these plantations.

“The cultivation of the maguey has real advantages over the cultivation of maize, grain, and potatoes. This plant, with firm and vigorous leaves, is neither affected by drought nor hail, nor the excessive cold which prevails in winter on the higher *Cordilleras* of Mexico. The stalk perishes after efflorescence. If we deprive it of the central leaves it withers, after the juice, which nature appears to have destined to the increase of the hampe, is entirely exhausted. An infinity of shoots then spring from the root of the decayed plant; for no plant multiplies with greater facility. An arpent of ground contains from twelve hundred to thirteen hundred maguey plants. If the field is of old cultivation, we may calculate that a twelfth or fourteenth of these plants yields honey annually. A proprietor who plants from thirty thousand to forty thousand maguey is sure to establish the fortune of his children; but it requires patience and courage to follow a species of cultivation which only begins to grow lucrative at the end of fifteen years. In a good soil, the agave enters on its efflorescence at the end of five years; and in a poor soil no harvest can be expected in less than eighteen years. Although the rapidity of the vegetation is of the utmost consequence for the Mexican cultivators, they never attempt artificially to accelerate the development of the hampe, by mutilating the roots or watering them with warm water. It is discovered that by these means, which weaken the plant, the confluence of juice towards the centre is sensibly diminished. A maguey plant is destroyed if, misled by false appearances, the Indian makes the incision long before the flowers would have maturely developed themselves.”—*Thompson's Alcedo.*

“The juice of the agave has a very agreeable sour taste. It easily ferments on account of the mucilage and sugar which it contains. To accelerate the fermentation they add a little old and acid pulque. The operation is terminated in three or four days. The vinous beverage, which resembles cider, has an odor of putrid meat extremely disagreeable; but the Europeans who have been able to get over the aversion which this foetid odor inspires, prefer the pulque to every other liquor. They consider it as a stomachic, strengthening, and especially very nutritive; and it is recommended to lean persons. Whites, also, have

At the southern extremity of the town, is a large estate belonging at present to Don — Arguire, called the "*Hacienda Arriba*," or the upper hacienda, to distinguish it from the "*Hacienda Abajo*," or lower hacienda, of Don Manuel de Ibarra, four miles distant. This is one of the most extensive and valuable estates in Coahuila. Its chief products are wine and wheat. The vineyards which surround it, extend twelve hundred varas (3240 feet) into the plain, while beyond these are extensive fields of wheat and maize. As it seldom rains here, the cultivation of the grape as well as of the cereals, depends wholly upon irrigation; yet there is no river to supply it. In the rear of this hacienda, about half a mile distant, the water oozes from numerous springs in the side of a hill; which unite at the base and form a small stream. This stream as it passes over the porous rocks, receives constant additions. As the descent is considerable, the whole of this water is controlled, and conveyed through a stone aqueduct, first to a flouring mill, and then to the vineyards, gardens, and fields of the hacienda arriba, furnishing an

been known, like the Mexican Indians, totally to have abstained from water, beer, and wine, and to have drank no other liquor than the juice of the agave. Connoisseurs speak with enthusiasm of the pulque prepared in the village of Hocotitlan, to the north of Toluca, at the foot of a mountain almost as elevated as the Nevada of this name. They affirm that the excellent quality of this pulque does not altogether depend on the art with which the liquor is prepared, but also on a taste of the soil communicated to the juice, according to the fields in which the plant is cultivated. There are plantations of maguey near Hocotitlan (*haciendas de pulque*) which bring in annually more than forty thousand livres, or one thousand six hundred and sixty-six pounds sterling (about eight thousand dollars).—*Alcedo. Humboldt's New Spain.*

abundance for all. In fact, with the fall, there is sufficient power to carry other mills, before it reaches the plain where it is to be absorbed by the soil. A portion of this prolific supply, is led by an acequia through the town.

I made a visit to this hacienda, with several gentlemen of my party; where we were politely received by the superintendent, who conducted us through the establishment. The wine vaults are built of adobe, with walls about twenty-five feet in height. By an inscription on the rafters, it appears to have been roofed over in the year 1775; yet the timber did not appear to be more than ten years old. The building is said, however, to be much older, the rafters being a portion of the renewed edifice. The several kinds of wine and brandy were arranged in very large casks on both sides of the vault, the whole exhibiting great cleanliness and order. The wine, both white and red, that I tasted, was far superior to that made at El Paso. About ten thousand gallons are made here annually, for which there is a good market in Coahuila and the adjoining States. The amount of wheat raised on the estate, is about two thousand fanegas, or 5250 bushels; all of which is converted into flour at the hacienda. The granaries are spacious buildings, about one hundred and fifty feet long, from forty to fifty wide, and twenty-five feet high. These, as well as all the buildings belonging to the establishment, are but one story in height. Extensive improvements are now going on, with the addition of new buildings; these are of adobe, plastered over with mortar, and hard finished, and have a very beautiful appearance. This hacienda was

purchased by its present owner about four years before for \$130,000, and now yields an annual income of from twenty-five to thirty thousand dollars.

There is another large wine manufacturer in Parras, Don Jesus Campus, whose establishment we also visited, and which like the former, was kept in fine order. I bought a keg of wine of him, which was said to be ten years old, and a superior article. It was put up with great care; yet, on arriving at New-York, it was found to be sour. All others who have attempted to transport this wine to the United States, have been equally unsuccessful.

Parras contains three churches, which were shown to us by the cura, Juan B. Bobadilla, a courteous and intelligent gentleman. Two of them abound in pictures of a higher standard than any we had seen. More care, too, was taken of them, as well as of the churches, which were in good condition, and exhibited none of those symptoms of decay prevalent every where, except in Chihuahua.

The cura manifested much interest in scientific pursuits, and was quite desirous to know what we had collected. He presented us with some specimens of minerals, reptiles, and insects, and promised to send me a larger collection as soon as he could procure them.

I have omitted to speak of two fine Alamedas, the fashionable promenades of the town. These are beautifully shaded with long rows of large cotton-wood trees, while flowers and lesser plants ornament the walks.

We made several pleasant acquaintances here, and found that Americans were much respected. Many

inquiries were made about General Wool and his officers, who were here during the war, and who seem to have made a favorable impression on the people.

December 2d. Our repairs being completed, we left in the afternoon, and proceeded as far as the *Hacienda abajo* or San Lorenzo, a large and elegant establishment surrounded by lines and clusters of old cottonwoods. Vineyards and corn-fields extended far and wide over the plain. The owner, Don Manuel de Ibarra, being absent, we did not visit the interior. The whole constitutes a large village. It derives its supply of water from springs in the hills. Don Manuel treated General Wool and the officers of the American army with great respect when here; in return for which, they sent parties against the Indians who had committed depredations on his herds. To this gentleman also belongs the hacienda at El Pozo, where the fight took place between Captain Reid and the Lipans, before mentioned.

December 3d. Our route to-day was hilly and tortuous. We made twenty miles; which brought us to a cluster of houses known as the *Cienega Grande* (Great Marsh), belonging to Don Rey de Guerrero. Fields of wheat were near, with acequias from springs in the mountains.

December 4th. We travelled to-day eighteen miles over a rough and hilly country, the road much cut up with ravines and deep with dust. Saw no cultivation or arable land until we reached *Ceguín*, where there was a cluster of houses, with fields of maize and wheat; but the people were too lazy to bring us corn-stalks for our animals. They said it was too much trouble.

Fortunately we brought a little from Cienega Grande, or we should have been badly off for fodder.

December 5th. The country was much the same to-day as yesterday, with low hills and valleys alternating, and intersected with arroyos which required much care in crossing. Passed several cornfields, with which exception all was barren and desert-like. At sunset reached *Vequeria*, a hacienda near a spring, twenty-five miles from our starting place. As we passed along, I noticed many gigantic *yuccas* growing in the form of trees with trunks and branches.

The different species of yucca, of which frequent mention has been made, form a conspicuous feature in the vegetation. They present a great variety of foliage, some narrow and grass-like, and others rigid and firm enough to serve for a "Spanish bayonet," a popular name given to the larger kinds. All are furnished with a sharp hard point at the end of the leaf, which is capable of inflicting a severe wound, and which soon teaches the incautious traveller to give them a wide berth. While some have no stem at all, others have a trunk twenty-five or thirty feet high and from two to three feet in diameter. The largest specimens we saw were near Parras, where the table-lands are covered with them. This species throws out at the top ten or a dozen branches which are bent in all possible directions. A plain covered with yuccas presents a beautiful appearance when in flower with their pure white blossoms arranged in pyramidal spikes several feet in length. The Mexicans and Indians put the different species to various domestic uses. The leaves of the narrower kinds are made into baskets, and the

fibres of the leaves are twisted into coarse ropes. The trunks of the large species are used in the absence of other timber as palings for making inclosures, or are split into slabs to serve for covering the rude houses of the rancheros.

Yucca Tree.

Some species bear an edible fruit called by the Mexicans *latiros*. These are about the size and shape of the *banana*, and when fully ripe are very sweet and palatable. The tender portion of the stem near where the leaves are produced is roasted and eaten under the name of *quite*; but it is rather stringy and insipid. One of our party saw at an Apache camp a pot-full of

the flowers boiling for food. The uncooked flowers have quite a bitter taste; but this may probably be removed by boiling. The roots of a narrow-leaved species called *amole* are used, instead of soap, for washing clothes; bruised between stones, they afford a mucilage when rubbed upon the clothes, which seems to possess considerable detergent properties. The root is generally kept for sale in the towns, and, where soap is so very dear, affords an economical substitute.

December 6th. Our intention was to reach the rancho of San Juan to-day. Soon after leaving, we saw through an opening in the hills on our left, about a mile distant, the *Hacienda de Patos*. This place is the property of Don Jacobo Sanchez, and is said to be the finest in the State of Coahuila. This gentleman is said to be the owner of three quarters of the landed property in the State, including several large and valuable haciendas, well stocked with cattle, mules, and horses. He has lost large numbers by the Indians, and, I am told, has made a claim on the United States for a million and a half of dollars as an indemnification for these losses. Yet he takes no pains to protect his property, not even arming his herdsmen, and never pursues the Indians or makes any efforts to recover what he has lost. In entering into a compact with Mexico for the protection of her frontier, the United States certainly expected either the Mexican government or the proprietors to do *something* for their own protection. The lands of Don Jacobo extend in a continuous line more than a hundred miles. Such a landholder could well afford to support a body of expert riflemen or rangers, who should be always on the alert

and pursue the Indians whenever found on his domain. Mules are extremely plentiful here, and are valued at twenty dollars a head on an average. I presume Don Jacobo estimates his mules in his claim on the United States at from fifty to sixty dollars a head. This is about the advance that Americans put upon their property, of whatever nature, when the government is to pay for it; and we can hardly expect the Mexicans to be more moderate than our own citizens.

One of our wagons broke down to-day and so injured the axle-tree that it would not retain its wheel. It was, therefore, taken off and the axle sustained by a long pole.

Our road ascended gradually until we reached an elevated plain with high mountains around us. Passed several ranchos, with large fields of maize. These fields were in the depressions of the plain, and derived sustenance from the drainage of the mountains. The corn looked as well as when artificially irrigated. Among the villages passed was one exclusively of *Peons*. It consisted of a cluster of extremely rude dwellings or huts around a square, many of which were built entirely of the yucca tree. Its trunk set upright formed the walls and doors, while its leaves, placed on poles, after the manner of thatching, made the roof. Want and wretchedness were stamped upon these rude hovels, as well as on the poor creatures who occupied them.

We tried to buy corn-stalks here, but they had none for sale, which obliged us to move on. When opposite San Juan, a cluster of miserable huts a quarter of a mile from the road, I sent to see if fodder

could be procured; but, much to our surprise, the people would sell none, although there were large corn-fields near. It was, therefore, necessary for us to push on and endeavor to reach *Encantada*, ten miles further. The road proving very good, we got along very well after dark by driving cautiously, and arrived at our place of destination in safety—a place rendered famous from its connection with the campaigns of General Taylor and the battle of Buena Vista. Distance travelled to-day, thirty-two miles.

December 7th. Before I had risen this morning, I was aroused by the arrival of a courier bringing me dispatches from Washington, and letters announcing the arrival of Major Emory and his corps of engineers at Ringgold Barracks, Texas.

Encantada (Enchanted) is a small village, where the American army under General Taylor was encamped at the time of the approach of Santa Aña with his army of twenty-five thousand men, previous to the battle of Buena Vista. Not finding the position an advantageous one, he fell back and took position at Angostura, the narrowest portion of the valley leading to and beyond Saltillo, which is six miles distant. This valley or pass lies between two ridges of mountain five or six miles apart, which approach towards the north-east, until at Angostura the space is not more than two miles. The eastern range is much the highest, rising ten or twelve hundred feet above the plateau; the western is about half that height. The plateau from the eastern ridge extends about a mile, or half way across the valley, when it drops off abruptly to the flat or alluvial bottom. In

this bottom runs a small rivulet, which takes its rise at Encantada; but at times, after heavy rains, it is so much swollen that it has cut for itself a deep bed, with perpendicular banks, from twenty to thirty feet deep. This bed is quite inaccessible from above, except in a few places. These deep gullies or ravines are called *barrancas*, and are peculiar to the country. The tenacity of the soil prevents it from crumbling, except at the base, where the water washes it away. The upper portion then projects, until it has become so much undermined that it cannot sustain itself, when it breaks off, leaving perpendicular walls. These *barrancas* extend for more than a mile above and below the narrow pass. They also intersect various parts of the bottom, rendering it impossible for a body of troops to traverse it. Hence all the operations were confined to the plateau above, which extends to the eastern range of mountains. The battery of Colonel Washington was stationed between the *barrancas* and a spur of the plateau, a narrow pass some sixty or eighty feet in width.

The road leads directly through this pass; and on reaching it, we stopped within the redoubt thrown up by Colonel W. I told the men to fasten their teams, and all that felt disposed to visit the battle field to do so. We walked up one of the steep hills or spurs, and reached the plateau, where the party strolled about in all directions as far as the mountains. I had a plan of the battle with me, which enabled us to find the positions occupied by our several bodies of troops. Many relics were found, such as grape shot, bullets of lead and copper, gun-flints, fragments of

gun-locks, cap trimmings, etc., also a few fragments of human bones. I took two sketches of the battle field, one looking south, the other towards Saltillo. About two miles distant is the small village of *Buena Vista*. The Mexicans call the place where the battle was fought *Angostura*, which means a *narrow pass*.

Leaving this ever-memorable spot, we pushed forward, and at two o'clock reached Saltillo. The town is completely hidden from view until one reaches the brink of the hill in front of it. We drove at once to a court-yard on one of the main streets, where we found accommodations for the whole party. The animals were placed in a corral near by.

We had been in town but a short time when our arrival became known; for our train of six large wagons, five ambulances and carriages, and about forty long-bearded men, armed to the teeth, always produced a sensation when we entered these quiet towns and villages. Several Americans residing in the place made their appearance before we had got stowed away in our quarters, and brought us the news of the result of the Presidential election.

December 8th. Having some repairs to make on a wagon, we applied to a blacksmith, but he declined working, as it was "El dia de la Purissima Concepcion," when a great celebration was to take place in the church. Before this man could work or allow his shop to be used, we were obliged to ask permission from the *gefe politico*—a privilege that was readily granted. This being done, we spent the remainder of the day in looking at the town and its fine churches. The principal church, which occupies one side of the

plaza, is a noble edifice, though its exterior is yet unfinished. Its interior surpassed any thing we had yet seen, not excepting the cathedral at Chihuahua. It abounds in pictures, some of which are very fine, and are doubtless the work of the old masters. The architectural ornaments, sculptures, gilding, etc., exhibit much taste, and are in fine preservation. We went to the roof and towers, which enabled us to see the thorough manner of its construction. Our New York builders might obtain some useful hints by examining this edifice, the walls of which are double in thickness that of any similar building in New York city.

December 9th. I rode this morning with Dr. Hewison, an Irish gentleman long resident in Mexico, to visit his cotton factory about three miles distant. It is a neat building of adobe and stone, two stories high. Its power is obtained from a spring of water about a mile distant, in the direction of the hills. This water is first collected in a reservoir, and propels a grist-mill; from this it is carried through an aqueduct, and furnishes the power for three small cotton mills, of which that of Dr. Hewison is one. When these have used it, it is conducted to other small grist-mills; and when it has been made to do all this work, and has reached the level plain, it is led by acequias to irrigate the gardens and fields of maize and wheat. So careful are the mill owners of this water, that it is not allowed to escape and run off at night, or when the mills are not in operation. At such times the gates are closed, and the water collected in a stone reservoir above.

I was enabled to ascertain the exact quantity of water from which all this power is obtained. The

stone aqueduct through which it ran was eighteen inches broad, and the water between ten and twelve inches deep. One of the mills was carried by an over-shot wheel forty feet in diameter; the others by wheels somewhat less. The superintendent of Dr. Hewison's mill is from Rhode Island. The operatives are all Mexicans, and, I was told are very quick at learning the art of weaving, and much easier to manage than American operatives. The cotton used is raised in the valleys near, and a ready market is found for the goods as fast as they are produced.

This factory was the favorite ride of General Taylor while in Saltillo; and it was a source of gratification to find that the officers of the American army were still held in high respect by the citizens of the place.

Saltillo, the capital of Coahuila, is a well-built city, with paved streets. Many of its houses are of two stories, and all of them painted in warm colors. The population is about fifteen thousand. Besides the churches mentioned, there is an unfinished edifice, which was commenced by the Jesuits. The Alameda is the finest place of the kind we had yet seen. It is filled with large trees, and its walks are lined with agaves and rose-bushes. In the evening I called, accompanied by the gentlemen of the Commission, to pay our respects to Dr. Hewison and his lady.

CHAPTER XLIII.

SALTILLO TO RINGGOLD BARRACKS.

Leave Saltillo—Accident at the start—Enter the Rinconada Pass—A night in the defile—Los Muertos—Ampudia's redoubt—Magnificent scenery—Hacienda of the Rinconada—Sierra Mitra—Santa Catarina—Suburbs of Monterey—Loma de Independencia—Arrival at Monterey—Pronunciamentos—Visit the Bishop's palace—Beautiful valley—The citadel—Prosperity of the city—Its climate—Elevation—Departure—Marin—Ramos—Carrizitos—Dense chapporal—Miss the road—Cerralvo—Pun-tiagudo—Bad road—Mier—Trade for serapes—Texan Mier Expedition—Character of the Rio Grande above Mier—Ascent of a steamboat to Loreda—Ancient oyster beds—Rio San Juan—Mexican brigade—Ca-margo—Cross the Rio Grande—Arrival at Ringgold Barracks.

December 10th. As we were not yet out of the reach of the Indians, I applied to, and was furnished with an escort of ten mounted men by the authorities here, who were promptly on the ground at the hour named for starting. Our repairs being completed, we left Saltillo this morning, but had not proceeded more than three or four miles, slowly over a smooth and level road, when the wheel of another wagon gave way, without any apparent cause. On examination it was found that most of the spokes and the rim were broken, so that the wheel was utterly ruined. Fortunately, we were near Dr. Hewison's factory, to which I rode

immediately, and was promptly furnished by the superintendent with a beam, which we rigged to the end of the axle as a drag. After the delay of an hour or two, we again moved forward. We passed many haciendas and ranchos, and after proceeding about twelve miles entered the famous *Rinconada pass*.* The road now became very uneven with a continuation of hills and valleys, while mountains rugged and lofty rose on either side; the defile averaging about two miles in width. Passed a monument erected by the ladies of Saltillo on the spot where some Americans had been murdered by robbers. After making about twenty-five miles, we reached a rancho in the pass called *Los Muertos* (The Dead), where, just at sunset, we encamped. A small stream flowed by, lined with large cotton-wood trees.

December 11th. It was very cold when we left camp this morning, our elevation now being 6104 feet above the level of the sea, so that all wrapped themselves in blankets or overcoats. Our escort, who put on their gaudy serapes, made a very picturesque appearance. Soon after leaving we reached a narrow and steep descent, where we were obliged to wait for a train that was coming up, before we could descend. Here the pass did not exceed five hundred yards in width. Near this, on the left, is a spur of the mountain which overlooks and commands the defile, where General Ampudia erected a battery or breastwork, for the purpose of checking the advance of the American army. While the train was waiting, I went out to

* *Rinconada*, a corner or lurking place.

examine this work, which was but a few rods off, and took a sketch of the magnificent defile. Far ahead, we could just perceive the picturesque summit of the *Sierra Mitra* (Mitre Mountain), so named from the striking resemblance of one of the summits in the range to a bishop's mitre. The place selected for the Mexican battery would have greatly embarrassed our army had it been maintained; but after the fall of Monterey, it was abandoned.

Soon after descending this hill, we reached the rancho of Rinconada in a curious little nook in the mountain resembling a horseshoe, which gives its name to the pass. From the number of fruit trees and cultivated grounds it had doubtless been once a thriving place. Every thing now seemed to be fast going to ruin.

We continued to descend the whole day; yet, owing to the roughness of the road, and our three-wheeled wagon, we were obliged to drive with great caution, that we might not further disable ourselves. Our escort pointed out to us as we progressed another rancho, which was attacked by a band of Indians a few months before, and all the inmates murdered.

We were unable to reach Monterey as we had hoped to do, and it was long after dark when we reached the village of *Santa Catarina*, at the base of the Sierra Mitra and about twenty miles from the Rinconada, where we encamped.

December 12th. Soon after leaving, we passed the *Molino de Jesus Maria*, a large flouring mill, and shortly after reached the *Loma de Independencia* upon which stands the Bishop's palace, so celebrated in the opera-

tions of the American army during the investment of Monterey. Having now reached the valley in which stands the city, we passed by walled inclosures where, among a variety of fruit and ornamental trees, we saw some loaded with oranges and lemons. Stone houses with high thatched roofs, surrounded by pretty gardens with more of an air of comfort than any we had seen, lined the approach to the city. On entering, we drove to a corral; and after putting up the wagons and animals, we took up our quarters at Coindreau's Hotel; a spacious building with a large court, in the style of the country. One might have imagined that another bombardment was going on from the roar of cannon, as we entered the town; but it proved to be nothing more formidable than the celebration of the day of the "Holy Lady of Guadalupe," one of the greatest festivals of the country.

December 13th. Lost no time in setting the blacksmith and carpenter at work, and in the mean time sallied forth to see what was remarkable in and about the city. We found several Americans in the place, although the number had greatly diminished within a year. There are a great many shops, and every description of goods to be found in them. In many of them the clerks speak English, acquired during the occupation of the city by the Americans. A large commerce has now grown up between Monterey and the United States, which will tend to Americanize the place. At the time of our visit, the singular state of the frontier had greatly contributed to increase this commerce. *Pronunciamentos*, another name for revolutions, were then in vogue at Matamoras, Camargo,

Monterey, and other towns, under various political pretexts; while the real object was to destroy the custom-houses, for the purpose of introducing merchandise without duty. Large quantities had thus been brought in, and sent into the interior of the country.

Rode out to the Bishop's palace; from which, as well as from the Loma de Independencia in the rear, one obtains a fine view of the city. This is a fine old building of stone, and in its day was no doubt an elegant structure; it was in ruins, however, long before General Worth took it. The hill on which it stands is about one hundred and twenty-five feet high; but the portion where the American forces made their charge, is some fifty feet higher. On reaching that, they commanded the palace, where the Mexicans had entrenched themselves behind a strong battery, but which they were soon compelled to evacuate.

The city stands on a plain about a mile distant, and is embosomed among beautiful gardens and orchards, its white houses presenting a striking contrast with the deep green of the foliage. To the south, runs a small stream, a branch of the San Juan River, in the midst of a broad arroyo; beyond which a chaporal plain interspersed with a few cornfields, extends about seven miles to the Saddleback Mountain, one of the most singularly shaped eminences in the country. This mountain is isolated, and forms the last link of the great chain which so abruptly terminates here. To the north and east of the city, a broad plain extends as far as the eye can reach, with here and there fields of corn and sugar cane, among wider fields of chappo-

ral. About half a mile from the city on this plain, stands the "Black Fort," or citadel, a prominent feature in its fortifications. I went to this fort, but although I sent my card to the commanding officer, was refused admission.* It covers an area of about three acres. Its walls are of solid masonry, with bastions commanding the approaches from the northward. On the eastern side of the city, are several redoubts, as well as along the margin of the arroyo. It was in the taking of these that our army suffered most. The old tannery, where there was a sharp contest, remains just as it was left by our troops. An American gentleman familiar with the history of the affair, accompanied me in a visit to this quarter, and pointed out the several localities.

Monterey is the capital of the State of Nueva Leon, and has a population of from fifteen to eighteen thousand souls.† It is the only city I visited in Mexico (Hermosillo in Sonora, alone, excepted) which is increasing. Here improvements were in progress. Many fine houses were in the course of erection; others were undergoing repairs, and every thing had the appearance of a thriving, active place. The streets are paved and kept clean. Much as has been said of the filth of Mexican towns, I can testify that our New York street inspectors might profit by the example of Monterey.

* In my various journeys through Mexico, this was the only instance of the kind that I met with.

† My estimates of the population of this and other towns, are from Mexican authority, and are not always reliable. People are too apt to over estimate the population of their towns, and are reluctant to confess their decline.

We visited the church on the plaza, which had been the hospital for our troops. It contains some bad pictures, and a large quantity of massive silver plate. Into this plaza the Mexican troops were driven before they capitulated.

The city has an elevation of 1626 feet above the level of the sea. We had therefore descended, since leaving Encantada, in a distance of seventy-six miles, 4478 feet.* With this sudden descent, we noticed a striking change in the temperature. As long as we were on the high table-land, the mornings and evenings were invariably cool, so as to render an overcoat necessary. We were all glad to get around fires, whenever there was fuel enough to make one; and at night, three or four blankets were necessary. Now, on the contrary, we experienced the genial warmth of June, with roses in bloom in the open air; thin clothing felt comfortable, and the nights were mild.

December 15th. Resuming our journey this morning, we passed near the citadel, where our escort of ten dragoons, kindly sent by the Governor, joined us. Our route was now across a broad plain unobstructed by hill or mountain. Passed several ranchos, where the people were engaged in boiling sugar. This region produces fine cane, though its cultivation is not so extensive as would be supposed. Passed, also, the small towns of *San Domingo* and *San Francisco*; and three miles beyond stopped at *Aqua Fria*, a straggling town built upon two sides of a deep arroyo.

* Encantada, according to Dr. Wislizenus, is 6104 feet above the sea.

December 16th. The road descended as it did yesterday, and was lined on both sides with dense chapporal. Made a noon halt at a fine stream, the *Rio Meteros*, just beyond the town of *Marin*. Passed *Aqua Negra*, where, during the war, General Canales, with a guerilla band, burned a train of United States wagons, and murdered the unarmed teamsters. At 3 o'clock, reached Ramos, a small agricultural town, eighteen miles from our last camp, where we stopped. The people collected around us soon after our arrival; and from them we learned that it was exceedingly sickly in the place; many of them were suffering from fevers.

December 17th. Our road to-day was very hilly and stony. Chapporal and low trees closely hemmed in the road, rendering the march dull and monotonous. At 4 P. M., we encamped at a rancho near the town of *Carrizitos*, where we obtained corn and water.

December 18th. Between Monterey and the Rio Grande, the chapporal is crossed by frequent roads, some running to Reynosa, others connecting villages and ranchos. We were told of this difficulty; but as the courier who brought my letters from Camargo to Encantada, said he knew all the roads, I was induced to let him act as our guide. To-day, however, he mistook his way, and led us into an almost impassable wood. We could not turn around, and were compelled to cut our way for some distance before we struck the road again. Fortunately we extricated ourselves without accident, after the delay of an hour or two.

Soon after, we met with an accident that might have proved more serious. This was the loss of one of the iron boxes to a wheel hub. The train was stopped

and men sent in search of it, who found it four miles back.

Reached *Cerralvo* at noon. This is a better looking town than any passed since leaving Monterey. Many of its houses are of stone, and built with some taste. Pushing forward, we encamped at *Puntiagudo*, about twenty-four miles from our last camp. This is a small village, which still exhibits the effects of the late war in the bare walls of its ruined houses. A small stream passes here, one of the tributaries of the Alcantra.

December 19th. Our road continued over low hills with deep and narrow arroyos at the bottom, one of which cost us a wheel and a tongue. An occasional ravine to pass with abrupt banks, is bad enough; but to-day the whole country seemed to be cut up with them, requiring the utmost care to prevent accidents. After thirty miles of continuous chapporal and a bad road, we reached the town of Mier, on the Rio Grande at 8 o'clock, though it was midnight before we could get corn for our animals, and reduce our camp to quietness.

Mier is an old town on the banks of the Alcantra, a small stream which empties into the Rio Grande three or four miles beyond, and appears, like most other Mexican towns, to be on the decline. In 1828 its population was two thousand eight hundred and twenty-one. It is now much less. Many of its houses are of stone, and well built. It has no lands capable of irrigation; the people, consequently, are obliged to depend upon other occupations than agriculture for support; and this, doubtless, is the reason of their indus-

trious character. Mier is celebrated for its fine manufactures of *serapes* and blankets; and there was scarcely a house in which we did not see the women occupied in weaving them. These serapes, which are worn by all classes, are made of wool, ornamented with a variety of figures and of various colors. They bring from six to one hundred dollars each, according to their quality and ornaments.

This town fills an important place in the annals of the Texan revolution, on account of its capture by the Texans, under the command of Colonel Fisher, their surrender afterwards to the Mexicans, and their subsequent history.*

Proceeding up the Rio Grande above Mier, the character of the country changes for the better, the bottoms becoming more fertile. The shores are for the greater part, a narrow strip of sand or gravel, surmounted by river bluffs of various heights. The willow, and occasionally the white cypress, occur near the river, while further back the mezquit, ebony, etc., abound.

* This party, which consisted of 261 men, crossed the Rio Grande, where they encountered a Mexican force of 2340 men, with whom they had a severe battle, and took possession of Mier. In this contest, according to the statement of General Green, an officer at the time, the Texan loss was, ten killed and twenty-three wounded—that of the Mexicans, between seven and eight hundred killed and wounded. The Texans were afterwards induced to surrender to General Mejia, on certain pledges being given them by General Ampudia. They were placed under a guard of three hundred men, and marched off to the City of Mexico. After they had passed Saltillo and were crossing the desert to San Luis Potosi, they rose on their Mexican guard at a place called Salado, overpowered them, and made their escape. Had they kept together and followed the roads, they would have found water and food, and

In October, 1846, a successful attempt was made to ascend the Rio Grande in the United States steamer Major Brown, by order of General Patterson, with a view to ascertain whether or not it were possible to open a communication between Camargo and the Presidio del Norte. This vessel drew but two feet of water. She experienced few obstacles in reaching the river Salado, nearly a hundred miles by water above Mier. Above this, there was a series of continued shoals, rocks, and rapids, among which the boat repeatedly grounded. She at length reached Laredo, a town about six hundred miles by water from the mouth of the river. Up to this point it was believed that, with the expenditure of one hundred thousand dollars, in removing obstructions, the river might be made navigable for boats drawing four feet of water.*

December 20th. The bad road of yesterday gave us considerable patching up to do, and caused several hours detention. The good people of the town availed themselves of this delay, and soon thronged the camp,

would doubtless have gained the Texan frontier. They, however, scattered and sought the mountains, where they suffered extremely for the want of water and food. The whole population was roused in pursuit of them; the small parties were picked up, and the main body reduced by starvation, finally surrendered. They were again marched back to Salado, where, by order of General Santa Aña, they were decimated. Out of 176 prisoners, 17 were shot, the remainder were sent to the city of Mexico. Of these, 35 died from suffering and starvation. Seven were released through the intercession of the American Minister, and four through the intercession of the British minister, &c.—*Green's History of the Texan Mier Expedition.*

* "Tilden's Notes on the Upper Rio Grande," of an exploration made by order of Major General Patterson.

each bearing on his or her arm a serape for sale; and I doubt whether, since the occupation of the country by the Americans, they have found so good a market for their productions. Many gentlemen of the party had been desirous to take home with them one of these articles; and the opportunity now presented of buying them fresh from the loom, and at prices much lower than we had seen them in the shops of Monterey and Saltillo, induced many to secure specimens.

In walking round the camp, my attention was attracted to some large oyster shells, which protruded above the clay bank; and, on extending my examination about seventy yards to the south, to a deep arroyo, I noticed thick beds of shells of the genus *Ostrea*, in its sides and on its bottom. According to Dr. Tilden, these beds extend up to near Laredo; and Dr. Wislizenus found them two miles below Mier on the immediate banks of the river. Our camp was near the town, and the surface of the clay bank where we found them, was at least fifty feet above the river.

We now set out for *Camargo*, twenty-five miles distant, keeping the western bank of the river, through a forest of chapporal. About several miles distant on the opposite bank, we saw the town of Roma, and soon after were cheered with the sight of a small steamboat, which occasionally works its way as far as this. It is evident that the navigation is attended with difficulties, as we saw her more than once fast on sandbars, which here begin to obstruct the navigation.

Finding that the train would not reach Camargo before dark, and being anxious to get to Ringgold Barracks as soon as possible, I set off in advance, ac-

accompanied by Mr. Radziminski and our guide. On reaching the river San Juan, a large stream which enters the Rio Grande, three miles from Camargo, and on which that town stands, we found a body of three or four hundred Mexican troops, cavalry and infantry, waiting to cross. This stream is quite deep, and is crossed by a ferry boat attached to a rope extending from one bank to the other. As the boat would hold but a few horses, it was evident that, if I waited for the whole to cross, I should not get over for hours. I sent my guide (who it appeared was a soldier belonging to the command at Camargo), with my compliments to the commanding officer, Colonel Cruz, to permit me to cross at once. This gentleman very politely acceded to my request, and directed the boat to take over me and my party immediately. On reaching the opposite side, I rode to the quarters of Colonel Cruz, to pay my respects to him, and request permission of him to allow the train of the Boundary Commission to pass unmolested. He assured me that every facility should be afforded the train to cross the San Juan, and thence to the American line. There was some danger here; for this officer was in arms against the Mexican government; and but for the character of my party, it would not have been suffered to pass so quietly. We had had, too, a narrow escape from the rebel chief Caravajal, who, with a band of some two hundred desperate characters, had been devastating the frontier. We had heard of them at various places after leaving Monterey; and at one village, we learnt that they had passed but the day before.

The population of Camargo is about the same as

that of Mier. Its houses are built of stone or adobe. There is more arable land here, and the same manufactures are carried on as at Mier. Before the Indian wars and the wars of Texas, there were numerous ranchos on both sides of the Rio Grande. Their occupants were chiefly employed in raising of cattle, of which at one time, they possessed not less than forty thousand head. These establishments have now been destroyed, or abandoned. During the late war, the American army had a large depot at this place. The steamboat which navigate the Rio Grande, finds no difficulty in coming up as far as Camargo. At high water, boats drawing five feet, ascend it with safety.

A ride of three miles, after leaving Camargo, brought us to the Rio Grande, which we crossed in a scow. Its width here is from one hundred and twenty-five to one hundred and fifty yards, with steep banks. On the American side is a considerable settlement, known as Davis' rancho; and about half a mile below is the military post, known as *Ringgold Barracks*. Hither I drove at once, and was met by Major Paul, the commanding officer, and the members of the Commission, who with Major Emory, the United States Surveyor, had been awaiting my arrival.

December 21st. Our train reached the opposite banks of the San Juan last evening, and was occupied the whole of to-day in getting across the two rivers, when the party encamped near the barracks.

CHAPTER XLIV.

RINGGOLD BARRACKS TO CORPUS CHRISTI.

Rio Grande surveying parties—State of the Survey—Despatches from Washington—Proviso affixed by Congress to the appropriation for the Commission—Letter of the Hon. Alex. H. H. Stuart, Secretary of the Interior—Money withheld—Compelled to disband the Commission and return home—Unfortunate situation of the party—Send the train and government property to San Antonio—Leave for the coast—The grassy prairies of Texas—Sal Colorado—Wells at Santa Teresa—Ravages of the Comanches—Night alarm from mustangs—Abundance of deer and antelope—Los Olmos—Immense drove of mustangs—Exciting race over the prairie—Horse lost—The prairie on fire—Rio San Francisco—Agua Dulce—Arrival at Corpus Christi.

December 22d. At Ringgold Barracks. When I left El Paso, it was for the purpose of joining Major Emory at this place, in order to complete the survey of the Rio Grande. I now learned from this officer that the survey had been carried as far down the river as *Loredo*, with the exception of a small space still to be covered between the great Chizo Cañon and the Rio San Pedro, on which two parties were then operating. It was believed that the small portion extending from Loredo to the mouth of the river might be finished in three or four months. The season was the most favorable for engineering operations, and the parties were

all on the spot with their instruments, camp-equipage, wagons, animals, provisions, etc. In fact every thing required to ensure the speedy completion of the work was at hand, except boats, which would be necessary when near the Gulf. But all my plans were frustrated by the despatches from Washington.

The despatch of the 15th October, 1852, received by me at Encantada, advised me that to the appropriation of one hundred and twenty thousand dollars made by Congress for defraying the expenses of the Boundary Commission, a proviso was added that it should not be used "until it should be made satisfactorily to appear to the President of the United States that the southern boundary of New Mexico is not established by the Commissioner and the Surveyor of the United States further north of the town called Paso than the same is laid down in Disturnell's map, which is added to the treaty."

In communicating to me this act of Congress, the Secretary of the Interior says, that the President and himself "have been forced to the conclusion that, in view of this restriction, the money cannot legally be drawn from the treasury." The Honorable Secretary expressed a strong desire that the work shall go on if I already have the means of maintaining the parties long enough to complete the survey of the river; but if otherwise, the Commission must retire from the field.*

* Here follows the despatch itself :

DEPARTMENT OF THE INTERIOR,
WASHINGTON, Oct. 15, 1852.

SIR:—In the Deficiency Bill of the last session, which was approved 21st July, Congress appropriated for the Mexican Boundary Survey the

The course I had to pursue was plain. Congress had said that if the southern boundary of New Mexico had been established further north of the town of El Paso than it is laid down in Disturnell's map, the money appropriated to carry on the survey could not be used. This was a new interpretation of the treaty, and one not required either by my instructions or by the words of the treaty itself. The boundary line was

sum of eighty thousand dollars. This was immediately absorbed by the drafts and liabilities which were then outstanding, and the additional sum of twenty-five thousand dollars for like demands was obtained by the act approved 31st August, which has also been nearly exhausted, and other debts still remain unpaid. In this latter the sum of one hundred and twenty thousand dollars was appropriated for the present fiscal year, with a proviso that it should not be used "until it shall be made satisfactorily to appear to the President of the United States that the southern boundary of New Mexico is not established by the Commissioner and Surveyor of the United States further north of the town called 'Paso' than the same is laid down in Disturnell's map, which is added to the treaty." Inclosed I send you a printed copy of my report to the President in regard to this proviso, and of his indorsement thereon. You will perceive that the President and myself have been forced to the conclusion that, in view of this restriction, the money cannot legally be drawn from the treasury. It will not be proper, therefore, for you to make any further drafts upon the department. * * * No exception has been, or could possibly be, taken to the river portion of the boundary; and it is much to be regretted that the department has not authority to use the appropriation for *that* portion of the survey. * * * You may, possibly, already have the means of maintaining your respective parties long enough to complete the survey of the river, or until you shall have been advised of further action by Congress on the subject. The withdrawal of the Commission is not imperatively called for by the action of Congress, except in so far as the withholding of funds may render it necessary. It would be very desirable to avoid it, if possible; as Congress will again be in session in the course of about six weeks, and possibly as soon as you will receive this communication.

established at $32^{\circ} 22'$ north latitude, where it stands on the treaty map. El Paso is placed on that map about seven minutes of latitude south of the boundary; but when this town is removed to its true position at $31^{\circ} 45'$, the distance between the town and the boundary is of course increased to the extent of the error of the map.

I had not money sufficient to continue the work, or

Such a movement would also be attended with much delay in the completion of the survey, and greatly increased expenses to the United States and to the government of Mexico, besides embarrassment and hardship to the employés of the Commission, whose sole dependence is upon their individual labors. It would likewise be a cause of further dissatisfaction on the part of the Mexican government. It will not be proper for you in any event to continue operations on the disputed portion of the boundary (the southern and western limits of New Mexico), nor to make any further drafts upon the department; and if you have not the means already acquired in the manner indicated for completing the survey of the Rio Grande, you will of course cease operations altogether, and return to the United States with your surveying parties. But not knowing precisely your situation in these respects, your return or continuation in the field must, with these views of the department before you, be left to your own sound discretion.

* * * * *

In the event of your being obliged to return from the field, you will make the best possible disposition of the government property in the service of the Commission. * * * But in all these matters you will be governed by considerations of economy to the United States, and convenience and expedition in the future resumption of the work.

I am, Sir, very respectfully,

Your obedient servant,

ALEXANDER H. H. STUART,

Secretary.

JOHN R. BARTLETT, Esq.,

U. S. Commissioner,

Mexican Boundary Survey.

even to defray the expenses of the officers and men to their homes. The money was tendered to me on my drafts by several houses to the amount of seventy-five thousand dollars, if I decided to go on with the survey; but the instructions sent me on this point were clear, and however desirous I was to complete the work, the will of my government must be obeyed, no matter at how great a sacrifice. The Honorable Secretary directed me, if I *already* had the means, to continue operations on the Rio Grande, if not, to cease altogether and return home. The intention of Congress was doubtless to break up the survey, and my duty was to submit.

The next step was to disband the Commission as soon as possible, to get the officers and men to their homes, and to place the valuable property of the government where it could be taken care of at the least expense, and where it would be convenient, should Congress, on further reflection, remove the proviso and order the survey to be resumed.

To reach Washington or New York from this distant place would cost a considerable sum; and I found my means quite insufficient to defray the expenses of more than one half of those whom the government was bound to transport back to the places from which they came. Here was a sad dilemma for a large body of men to be placed in by an act of Congress, without any fault on their part—men who had been most arduously engaged on a toilsome and dangerous service for two years and a half, risking life and health in the faithful performance of their duties. I would have been justified in selling off at once, at public auction,

all the government property; and appropriating the proceeds to the pay of the men, and to enabling the officers to reach their homes. Such a course would have been adopted by most officers placed in my position; but I was willing to submit to inconveniences if the laboring men could be relieved.

I determined, therefore, to divide the money in my possession among the officers, as far as it would go, to meet the expense of reaching their homes. It was enough for about one half. I then directed the quarter-master and commissary, Mr. George Thurber, to take the entire train of animals and wagons (including those used by Major Emory and his parties), together with all the public property, except the instruments, and proceed with the same to San Antonio. That place was a convenient point from which the survey could again be resumed whenever it would be the pleasure of Congress to order it; and it was a place where the animals could be kept at the least expense. I also desired Mr. Thurber to reserve twelve of the best wagons, one hundred mules, and a portion of the equipments and camp equipage, and to sell the remainder at public auction, and apply the proceeds to the payment of the men. And I further directed him to make arrangements with some mercantile house in San Antonio to advance the sum necessary to pay off the laboring men and teamsters, as well as to enable the remaining officers to return to their homes, and to draw on me at Washington for the same.* The instru-

* The train continued to Corpus Christi; after which Mr. Thurber proceeded to San Antonio, as directed. He there raised the

ments, both astronomical and surveying, were in charge of the principal surveyor, Major W. H. Emory. Having made these arrangements, we prepared to continue our journey to the coast. A steamer ran to Matamoras ; but as there was no communication between that place and New Orleans, I thought it the surer way to proceed by land to *Corpus Christi*, on the Gulf of Mexico, about one hundred and fifty miles distant, and thence by land or water to Indianola, where a line of steamers connected with New Orleans.

December 27th. Left Ringgold Barracks at one, P. M., with a portion of the train, accompanied by Major Emory with his officers and several wagons. Mr. Thurber remained, intending to follow the next day with the rest of the train. The country for five or six miles is undulating, with low hills and a gentle ascent from the river until the plain is reached. For this distance it is covered with the same dense chapporal as on the opposite side of the river, and is equally destitute of grass. Passing this belt, a higher level is reached, where there is better soil. Here grass begins to appear, with larger shrubbery ; the mezquit reaching a height of from fifteen to twenty feet, and

necessary funds, through the kindness of Messrs. Vance & Brother, merchants at that place ; which enabled him to discharge and pay off all the teamsters, laboring men, and mechanics, some sixty or seventy in number, as well as to furnish the means to the rest of the officers of returning to their homes. He then remained with three or four men, barely sufficient to take care of the hundred animals he had reserved and the other property, until the following June, when he was released by the parties sent out to resume the work. The interruption of the survey delayed its completion about eight months, at an additional expense of fifty thousand dollars.

forming thick woods. In passing a gully where the road was much washed away, the tongue of one of the wagons was broken and had to be repaired with ropes. Encamped after dark on the open plain, amid an abundance of grass.

December 28th. The prairie continued grassy, interspersed with the prickly pear and low mezquit, opening occasionally for a few miles without shrubbery. The road became quite sandy and heavy for the animals. In the afternoon, stopped at *Sal Colorado*, a miserable cattle rancho with a well, where we stopped to water our animals. This place is called forty miles from Ringgold, which is a large estimate. There are pens and corrals here, used for catching and securing mustangs, in which this portion of Texas abounds. Continued our journey to *Santa Teresa*, five miles further, where we encamped. Here was a deserted rancho in ruins, with three wells near. It had been used, like that at *Sal Colorado*, for ensnaring wild horses. Last year the Comanches attacked it, murdered the occupants, burned the houses, and took away all the cattle, mules, and horses. It has not since been occupied. In two of the wells, which were about fifteen feet deep, the water was brackish; but from the third we procured good water with some difficulty.

December 29th. The mustangs came around our camp in great numbers last night. They so alarmed the mules that, fearing a general stampede, the guard was obliged to fire upon them, which drove them off. The road to-day was heavy; the country an open rolling prairie, covered with luxuriant grass, and dotted with clusters of mezquit and oak. Now and then would

appear a long line or belt of these trees, extending a mile or more. At noon, stopped in a grove of mezquit, and sent our animals to a lagoon half a mile to our left for water. After letting them graze an hour, we resumed our march. We reached a pond four miles further, and a little beyond a second and larger one. This water was covered with wild ducks and geese; but they took the alarm at the first appearance of the train, and were off before we could get a shot at them. Keeping on a few miles, we encamped on the open prairie. Large numbers of deer, antelope, and wild horses were seen during the day; but the latter kept at a respectful distance. Two deer were killed.

December 30th. Off by break of day. The rolling prairie continued without trees or shrubbery, save here and there a little *mot* or group. As we approached *Loma Blanca* (White Hill), some low hills appeared, whose sides showed banks of white sand. Herds of mustangs, going at full speed, crossed and recrossed the broad prairie, presenting a beautiful spectacle as they stretched for a mile or more, with their long bushy tails streaming in the wind. They did not venture within a quarter of a mile of us. Deer and antelope were also seen in great numbers bounding over the broad plain or feeding in herds. They too were shy, and had evidently come in contact with man before. As there was neither tree nor bush to be seen, and no cover of any sort, all our efforts to get within rifle-shot were unavailing.

Near *Loma Blanca* is the bed of a laguna, which extends for more than a mile on both sides of the road.

There was every indication that it had recently been filled with water; but we sought for some in vain. Deeply worn paths made by the mustangs were seen in every direction, showing that it was a place of resort for these animals. After travelling eight hours we reached a chain of lagunas called *Los Olmos*, which crossed our path. Having travelled more than twenty miles over a sandy road, and our animals showing signs of great fatigue, we encamped. The water was sweet and the grass abundant.

December 31st. A portion of our journey yesterday was over the prairie, where there was no trace of a road. To-day continued the same; yet the man who pretended to guide us seemed familiarly acquainted with it. A few hours after leaving, the prairie near the horizon seemed to be moving, with long undulations, like the waves of the ocean. Unable to account for this singular appearance, I looked with my telescope, when, to my surprise, I discovered the whole prairie towards the horizon alive with mustangs. Soon after they could be seen coming towards the train.

Major Emory at this time was in advance of me about half a mile with his portion of the wagons. We saw the long line of mustangs approach him, and soon after pass before, the whole herd following after, and extending as far as the eye could reach across the prairie. The mules became restive, and we could see the teamsters hurrying forward the wagons for protection behind each other. On went the great stream, and the next moment one of the mule teams in advance sprang from the train and dashed off at full speed after and among the wild horses. The teamster

STAMPEDE OF THE TRAIN BY WILD HORSES.

W. H. Johnson del.

in vain tried to restrain them. It was all to no purpose. Away they went, John Gilpin like, the wagon with six mules, followed by all the loose animals that were driven with the train, which had also partaken of the stampede. The herdsmen, in order to check the runaways, left the train and went in pursuit, making altogether the most exciting spectacle we had yet witnessed. The chase continued for a mile; for the mules in the wagon had become perfectly frantic with fear, surrounded as they were by equally frightened mustangs, and all bounded over the prairie at their utmost speed. Seeing the danger, our men put on the lash, and we hurried forward to render such aid as lay in our power. The men of the other party fired at the herd, which had the effect of breaking the line, and turning it in another direction.

The frightened herd made directly for us, in the same long line, the termination of which we could not see, as it lost itself far in the distance. I now became alarmed, fearing a general stampede among our mules; for nothing can restrain these timid creatures when frightened. If they cannot take their wagon with them, they become so frantic that they will tear themselves from their harness and flee away. Our first precaution was to close up the wagons, so that only those in the first one would see the mustangs. The mules of the second were placed alongside of the foremost wagon, the next by the side of the second, and so on to the last, each wagon thus protecting the team that followed it. We now locked the wheels of all, and men stood by the leaders to restrain and quiet them. As I had no inclination to be carried off against

my will among a herd of frantic wild horses after the fashion of Mazeppa, I dismounted and hitched my mule to a wagon, and with several others ran with my fire-arms to meet the advancing steeds, which were now nearly upon us, led off by a fearless stallion. We discharged our arms at them as they approached, and fortunately with good effect. The leader was turned, and the avalanche of wild animals swept by us like a tornado, much to our relief. We held in for a few minutes until the herd had passed, when we unlocked our wheels and hastened forward to the first of the train, which had halted.

By the time we reached it, the runaway wagon and mules, with those who had been in pursuit, were just coming up after a most exciting chase. Fortunately no one was injured, and our animals were all captured and brought back, except one, and that one of the most valuable horses belonging to the party. This animal was ridden by the wagon-master, and when in full pursuit of the runaways, he stepped into one of the burrowing places which abound on the prairies, fell, and threw his rider over his head. Thus freed from restraint, he joined his wild brethren and disappeared on the prairie, with his saddle, bridle, and trappings.

As we continued our journey other herds of mustangs were seen coming from the east, but none approached us. Large numbers of deer and antelope were also perceived as we jogged along. In the afternoon we crossed a deep ravine, the dry bed of the *Escondida*, which bore the traces of recent water; and just beyond this the great prairie was on fire.

We had for hours noticed the huge volumes of smoke as they ascended from the plain, and attributed the flight of animals towards us, which we had seen during the day, to this fire. It stretched for miles in both directions, and was sweeping directly towards us. Whenever it reached a patch of high grass, volumes of dense smoke rose up, while the vivid flames leaped with greater rapidity over the plain. We rode up and down for some distance, but could find no opening through. At length a place was seen where the fire raged with less fury. Here the horsemen led the way; whereupon the teamsters put the whips to their animals, and uttering a loud whoop dashed through the flames.

A short distance beyond we passed another chain of lagunas, or small ponds, known as *Santa Gertrude*. The water was good here; but finding that we could make a few more miles, I hurried forward. Five miles further, over an excellent road, brought us to *San Francisco* River, which unfortunately had no water in it.

The prairie had been more level to-day, and, except where burned, was covered with excellent grass. The bed and banks of the San Francisco were lined with large trees overhung with moss. We made thirty miles to-day, for about half of which distance the road was excellent.

January 1st, 1853. At an early hour breakfast was despatched; and the tents were struck, and the party was in motion at the break of day. The prairie was now a dead level, the grass short, and the road very good. Not a bush or a tree was to be seen; yet there

was no lack of prominent objects; for thousands of deer and antelope were scattered over it. Never before had we seen such numbers. Drove of mustangs also appeared. The deer and antelope were usually grazing in herds of from ten to fifty; and as we approached they leisurely trotted off to a short distance, and again stopped. We shot none; for as I was desirous to reach Corpus Christi before night, we were pushing forward on the run, and could not be delayed for the sake of game, tempting as it was. Among the antelope I noticed several of a pure white.

Ten miles brought us to *Agua Dulce* (Sweet Water), where there were some filthy pools of water and several ranchos; and twelve miles further to the *Oso*, a small pond, or rather mud-hole, the water in which was so bad that the animals would not drink it. The road being good and the weather cool, we again dashed off on a run, when an additional nine miles gladdened our sight with the blue waters of the Gulf of Mexico, which stretched out before us in a long line, bounding the horizon for many miles. This was a delightful spectacle to us after an absence of two years and a half, and especially as it was the termination of a land journey of nearly two thousand three hundred miles. At three o'clock, P. M., we reached *Corpus Christi*, and drove to the excellent hotel of Mr. Noesler. Here we met Captains Gibbs and Rhett, Dr. Jarvis, and other officers of the United States army, from whom we were gratified with late news from home.

My first inquiry was for the means of reaching New Orleans; and finding there was no steamer running, and no means of reaching there except by tak-

ing an open boat through the lagunas to Indianola, a distance of about one hundred and forty miles, or making a land journey around the shore to the same place, I chose the former. I had had quite enough of land journeys for the present; and hearing there was a small boat at the wharf, I lost no time in chartering her to transport me and such others as chose to accompany me. She could stow away four persons beneath a piece of deck over the bow, by crawling in on the hands and feet; but there was not sufficient height to sit up. However, it was a change, and I determined to try it. The Captain agreed to leave in the morning.

CHAPTER XLV.

CORPUS CHRISTI TO WASHINGTON.

Corpus Christi—Its fine position—Geographical features of the country—Nueces Bay and River—A norther—Its effects on the fish in the lagnas—Leave Corpus Christi in an open boat—Shallow bays and lagnas of the Gulf—Vast numbers of water-fowl—Bays of Aransas and Espiritu Santo—Reach Decrow's Point—Matagorda Bay and its commerce—Embark for New Orleans—Galveston—Arrival at New Orleans—Voyage up the Mississippi, and by way of Louisville, Cincinnati, Cleveland, Buffalo, and Albany to Providence—Arrival at home—Proceed to Washington.

THE town of Corpus Christi is more pleasantly situated than any place I had yet seen on the Gulf of Mexico, having the advantage of a bluff from eighty to one hundred feet high above the shores of the Gulf. The business portion of the town stands chiefly on the beach below ; but the bluff is now being covered with dwelling houses, and is by far the most pleasant situation. Like other places on the northern shores of the Gulf, it is separated from the sea by a broad bay. Here there is plenty of water ; but on the bar which connects it with the Gulf there is only about six feet.

Corpus Christi Bay is about forty miles from north to south, and twenty from east to west. Connected with

it, and making far up into the land, is Nueces Bay, about ten miles long and five wide, which receives at its head the Nueces River. This river has its rise in the Guadalupe Mountains about three hundred miles distant. The stream, which is deep, narrow, and rapid, with very steep banks, is navigable for small boats, about forty miles from its mouth; and with some improvement the navigation might be extended to the point of confluence with the Rio Frio, its principal tributary. The latter has a course of about one hundred and fifty miles, and has for its tributaries the San Miguel, Atascoco, La Parida, and Tordillo rivers. The San Miguel is about one hundred and twenty miles in length, and runs nearly parallel with the Rio Frio. The Laguna, the Leona, the Arroyo Saco, and the Arroyo de Uvalde, are also branches of this stream—the last named “being formed of nearly a hundred springs of crystal water, that gush from the munificent soil of the valley, which is headed by a singularly difficult defile, named the Cañon de Uvalde.” West of Corpus Christi Bay, several small streams enter the Laguna del Madre, among them the Agua Dulce, Las Pintas, San Fernando, Santa Gertrude, Los Olmos, and Escondida. Most of these we passed in crossing from the Rio Grande; but the water in them was so low that we hardly recognised them as running streams, and some were entirely dry.

The land near Corpus Christi is very fertile. Groups and belts of timber are found near the coast; but after leaving this, a vast undulating prairie extends from the Nueces to within three or four miles of the Rio Grande. This plain is covered with the richest grass, and abounds

in mustangs, deer, antelope, and large herds of beef-cattle.

Opposite Corpus Christi Bay, separating it from the Gulf, is Mustang Island, about thirty-five miles long and from two to four in width. Further south, another long and narrow sound opens, called the Laguna del Madre, about ninety miles in length and from three to six in width; an island about the same length, and from two to four miles in width, separates it from the Gulf. This laguna is so shallow as to be unavailable for navigation, even for vessels of light draft.

The position of Corpus Christi renders it very healthy; and when many other places on the coast suffer from fevers, this, owing to its elevation, is exempt. It is at present the Head Quarters of the Military Division in Texas; and from the facility of entering the harbor, it is destined to be one of the most important places on the coast.

January 2d. There was a dead calm to-day, which prevented us from leaving.

January 3d. A violent norther arose during the night, and we had it piercing cold to-day. When in the house, we were seated by fires, and when outside the door, wrapped in our overcoats. Yet in spite of all our efforts, it seemed almost impossible to keep warm, so penetrating are these winds to systems which have become relaxed.

When these winds blow so violently, they drive the water from the shallow lagunas into the Gulf, and increase the difficulty of navigating them. Many of the bars are then nearly dry. There is one in particular, across the mouth of the Nueces Bay, which de-

serves to be noticed. When the tide comes into this bay, as well as in all others, it is resorted to by large numbers of fish from the Gulf, to feed. The water may then be from five to ten feet deep, and is of the same temperature as that of the Gulf. But after a norther has blown for twelve or twenty-four hours, its temperature is so much reduced, that the fish become chilled, and not having strength enough to make their way over the bar, now more shallow than ever, they often lie there in heaps. At these times the people go to the bar with their wagons, and with a spear or fork pick up the finest fish, weighing from ten to a hundred pounds, and thus carry away loads. Many were brought in to-day, and they proved a great luxury to us.*

To-day, again, it was impossible to sail, for we

* In the remarkable journey of Alvar Nuñez Cabeça de Vaca from Florida to Cinaloa, on the Pacific coast, between the years 1527 and 1535, he remained for eight months among a tribe of Indians on the Gulf of Mexico, whom he calls the Avavares. "They were all," he says, "ignorant of time, either by the sun or moon, nor do they reckon by the month or year; but they better know and understand the differences of the seasons, when the fruits come to ripen, *the fish to die*, and the position of the stars, in which they are ready and practised."

The season when the *fish come to die*, has never been understood. When Mr. Buckingham Smith, the learned translator and commentator of the "Narrative of Cabeça de Vaca," asked me, on my return from Mexico, whether in my journeys along the northern shores of the Gulf, I had seen or heard any thing that would enable me to elucidate the passage in question, the incident I have named as happening annually on the bars of the lagoons, when the northers blow, at once occurred to me; and on explaining what I had witnessed, Mr. Smith at once agreed with me that this was the true solution of the passage.

should have perished in an open boat ; so we kept as close as possible.

January 4th. The wind blew violently during the whole night, and the morning opened upon us as cold as ever. The buckets of water that stood outside the door were covered with ice an inch thick. During the forenoon, the wind began to subside, so that I was enabled to take a ride to some of the beautiful places in the vicinity. Several of the party, including Dr. Webb, Major Emory, and Mr. Radziminski, set out in wagons for Indianola, preferring that mode of conveyance. Mr. Henry Jacobs and two of the servants were all that would undertake the boat voyage with me.

About noon a light breeze sprung up from the land, when we embarked in our little craft for *Saluria*, a small port on the Gulf, at the entrance to Matagorda Bay, about one hundred and forty miles distant. We had not proceeded more than ten or twelve miles, before the wind died away and left us becalmed. Creeping beneath the deck that covered the forward part of the boat, we stretched ourselves on our blankets in a space about three feet wide, where we contrived to get a little sleep.

January 5th. The morning found us on the opposite side of Corpus Christi Bay, a light breeze wafting us eastward towards Aransas Pass. The navigation here is carried on with boats of light burden through the shallow bays or lagunas, which line the west and north-west shores of the Gulf of Mexico. These bays are exceedingly shallow, sometimes presenting a breadth of ten or fifteen miles, by a hundred or more in length. Yet these broad spaces of water are often

not more than three or four feet deep, even in the middle. This depth would admit flat-bottomed vessels of large capacity, were it not for the numerous bars which intersect them, sometimes leaving but a few inches of water; hence, none but flat-bottomed boats can navigate these waters, and even these may be suddenly arrested in their progress, should a norther occur and drive the water out of the bays.

Our course lay through a channel less than twenty yards wide for miles, with bars of sand on both sides but an inch or two above the water. These were covered with myriads of water-fowl, including cranes, swans, herons, ibises, geese, ducks, curlews, plover, sand-pipers, etc. The large cranes and swans stood in lines extending for miles, appearing like a light sandy beach or white cliff; and it was impossible to dispel the delusion, until the vast flock, with a simultaneous scream that could be heard for miles, rose from their resting place. Occasionally, we would round a point which concealed a bay the surface of which was filled with ducks and geese; these, taking the alarm, would rise in one continuous flock, making a noise like thunder, as they flapped their wings on emerging from the water. Notwithstanding the vast numbers of these birds, I shot but few; for the water was so shallow that we could not get within gun shot of them with our boat. With a light skiff, and a few bushes or a bunch of grass, a gunner would have such sport as no other portion of the world can surpass.

We ran ashore on a beach of shells, knocked up a fire of drift-wood, and got breakfast; after which we entered Aransas Bay, separated from the Gulf by St.

Joseph's Island. This island is less than two miles wide, and about twenty-five in length. South-west of this, between Aransas Pass and Corpus Christi Inlet, is Mustang Island, already spoken of.

Aransas Bay extends about twenty-five miles from north-east to south-west, and is about twelve miles wide. It has a general depth of from eight to twelve feet, but is obstructed by a shoal and range of islands extending across it, over which there is less than three feet of water. Connected with Aransas is Copano Bay, twenty miles in length by three in width. The shores of these bays are extremely low and flat.

We made but little progress to-day, the wind having died away ; and finding ourselves fast on a bar, there was no occasion to anchor. So we again turned in, and lay by till morning.

January 6th. One of the sailors carried me on shore on his back, that I might have a shot or two at the shoals of ducks near by ; but as there was no shelter behind which they could be approached, the few that I shot hardly repaid the trouble. We lay here several hours, when at length a light breeze sprung up from the west which wafted us onward, and across Espiritu Santo Bay, about twenty miles in length and ten in width. At its head, it receives the waters of two considerable rivers, the San Antonio and Guadalupe. It is separated from the Gulf by Matagorda Island, about thirty miles in length.

An amusing incident occurred when we were about midway across the bay. We had left Corpus Christi with but a single keg of water, expecting to make our voyage in twenty-four hours. But we had now been

out forty-eight hours; and unless a good breeze should favor us, we could not expect to reach our place of destination before the next day. Our water was gone; and there was none to be found on the beach. Seeing a small craft approaching from an opposite direction, we stood for her; and when within two hundred yards, our captain hailed her, and asked if they could spare us any water. The reply was in the affirmative; but when I expected we should pull for her, to my utter surprise, a sailor composedly stepped into the water, and, with a bucket on his arm, walked to the other boat, where he got it filled. The bay was less than three feet deep, although we were many miles from the shore, which was barely visible. Did one not know where he was, he might imagine himself at sea.

At the eastern end of the bay, the water was so shallow that the passengers were carried on the backs of the men to a small island near by, while the captain and sailors jumped into the water, and lifted and pushed the boat over. A little further we came to a "dug out"—that is, a passage cut or dug across a bar, about twenty yards through. Here the men got into the water again; and each of the passengers taking an oar, we managed to force the boat through. The shallowness of the water and the consequent difficulties of navigating these lagoons after a norther, may be judged of, when I state that our little craft drew less than fifteen inches.

January 7th. After a third night passed in the open boat, we emerged from these shallow waters soon after day-light; and crossing *Paso Cavallo*, with the town of that name on our right, we landed at 8 o'clock

at *Decrow's Point*. We breakfasted at a hotel, where we learned that the steamer *Louisiana*, from Indianola for New Orleans, would pass here to-morrow.

Decrow's Point forms the western termination of Matagorda Peninsula, a neck of land about sixty miles in length, and from one to two in width. Within this is Matagorda Bay, another shallow body of water, from six to ten miles wide. *Paso Cavallo* (Horse Pass) is the entrance to this bay from the Gulf of Mexico, and is always considered safe for vessels drawing from eight to nine feet of water. The principal and most accessible port within Matagorda Bay is Indianola, where steamers drawing eight feet of water enter. Many rivers empty into the bay; the largest of which, the Colorado, rises in the Guadalupe Mountains, and has a course of about eight hundred miles before it reaches the Gulf. Among the other streams, are the La Vaca and Navidad rivers. Within this bay is La Vaca, which is reached by small vessels. A railway is now in the course of construction from Saluria to San Antonio, which will render this the most important port on the Gulf, it being accessible for large vessels, and affording a safe harbor. An extensive commerce is now carried on between Indianola and New Orleans, with steamers of a large class; besides which, vessels run direct to New York and Boston. The number of passengers and the quantity of merchandise coming hither, are evidences of the thriving condition of this portion of the State.

January 8th. The steamer *Louisiana* came to, this morning, off the Point, when I took passage in her for New Orleans. Major Emory, Dr. Webb, Mr. Radzi-

minski, and the other gentlemen who had taken the land route from Corpus Christi, were on board. We stood out to sea with a light wind, and soon after headed to the north-east for Galveston.

January 9th. Entered the port of Galveston this morning, where we remained until 4 o'clock, P. M. This city had greatly increased since August, 1850, when we stopped here. Its commerce, too, judging from the number of ships and steamers, must have augmented in proportion.

January 10th. Late in the afternoon we reached New Orleans, where I took up my quarters at the St. Louis Hotel.

January 11th. On my journey from Texas, I learned by a newspaper that the United States Senate had, on the assembling of Congress, removed the restriction which prevented the use of the appropriation under certain conditions; so that the survey might now be permitted to go on again. But the commission had been broken up; the injury had already been inflicted upon its members, who were now scattered and on their way to their homes; and it was too late to return to the field of operations. I, therefore, sent a telegraphic despatch to the Hon. Alex. H. H. Stuart, Secretary of the Interior, advising him of my arrival at New Orleans, with a portion of the officers of the Commission, and requesting information respecting the funds at my disposal, as well as instructions as to further proceedings.

January 14th. After waiting four days for an answer to my despatch, the necessity of my being in Washington as soon as possible required that I should delay no longer; particularly as I now learned that

the telegraph wires were broken, and the communication consequently interrupted. I therefore took passage on the steamer Chancellor, to sail this evening for Louisville, accompanied by Dr. Webb and Messrs. Jacobs and Force. Major Emory and the other officers of the Commission were to take the land route; but having caught a cold in my boat voyage along the Texan coast, from which I was suffering severely, I deemed it most prudent to take a more easy though longer route by the Mississippi River.

Our boat was deep and consequently slow, so that it was ten days before we reached Louisville: the day after, we took another steamer for Cincinnati, which we reached the following morning, and immediately took the railway cars for Cleveland, on Lake Erie, where we arrived the same evening. I felt keenly the change of temperature to-day, as the ground was covered with snow, and we found ourselves in the midst of a northern winter. After an hour's delay at Cleveland, we took the shore railroad for Buffalo, which should have arrived at that place the following morning in time to connect with the eastern train for Albany; but we got fast in a snow bank, which detained us for six hours. Our fire went out, and there was no wood to supply it. At length the train from Buffalo opened the track, which enabled us to push our way through, so that we arrived in that city at noon. Having missed all the morning trains, we were obliged to wait until five o'clock before we could start for Albany, when the ice and snow on the rails so retarded us that we arrived there too late for the morning cars. We had, therefore, to lie over a day; but

this was not unacceptable, as we had been out the two previous nights. The next morning we took the railway for Providence, (Dr. Webb leaving us at Worcester,) where we arrived the same evening, and where I had the happiness of again meeting my family and friends, from whom I had been separated two years and a half.

I remained with my family two days, and then left for Washington, and presented myself at the Department of the Interior.

RESULTS OF THE LABORS OF THE BOUNDARY COMMISSION.

BEFORE closing this narrative, it seems proper that I should speak of the work accomplished while the Boundary Commission was under my charge. This I do, not so much to lay claim to any merit for the same on my own account, as that the labors of the officers who performed these duties may be made known, and proper credit be given to them.

I. A reconnoissance and survey from Indianola, on the Gulf of Mexico, to El Paso del Norte.

The plan of this operation was based upon astronomical observations, for the latitude and longitude of points, by means of a sextant, chronometers, and a four-feet telescope for observing occultations of stars

by the moon. These points were connected by a chain and compass survey, accompanied by a line of levels, as far as San Antonio. From El Paso the survey was continued to the Initial Point of the southern boundary of New Mexico on the Rio Grande, making altogether a distance of between nine hundred and a thousand miles surveyed.

At nearly all the astronomical stations on this line, upwards of fifty in number, observations were made by a Fox dip circle for magnetic inclination, declination, and intensity.

An accurate meteorological register was kept through the whole line of march. An interesting comparison of the aneroid and ordinary barometer was made, extending over elevations varying from the level of the sea to an altitude of six thousand feet. A complete set of barometrical and aneroid observations were taken for the construction of a profile, which shows the contour of the whole country from San Antonio to San Eleazario, on the Rio Grande, exhibiting not only the most prominent points, but likewise the elevations and depressions in each day's march.

The astronomical and magnetic observations were made by Lieutenant A. W. Whipple, of the corps of topographical engineers, acting chief astronomer in charge of the party, and under whose direction the whole work was carried on.

The survey was performed by John Bull, Esq., first assistant surveyor.

The map of this survey was plotted on a scale of one inch to the mile, and the topography accurately laid down by M. Von Hippel.

The meteorological observations, including the barometrical profile of the comparison of the aneroid and barometer, and the temperatures of the different springs, etc., etc., met with on the route, were by Marine T. W. Chandler, Esq.

The sketches exhibiting the characteristic features of the country, were made by Henry C. Pratt, and A. de Vaudricourt, Esqs.*

2. At the Presidio of San Eleazario, El Paso, Fronteras, Doña Ana, and the Initial Point on the Rio Grande, a more extensive series of astronomical and magnetic observations were made, and the latitude and longitude of these several places determined by Lieutenant Whipple personally. Lieutenant W. also erected an astronomical observatory at Fronteras, where a most interesting and elaborate series of astronomical, magnetic, and meteorological observations were made, the latter by Mr. Chandler, who continued them after Lieutenant Whipple had taken the field to conduct the survey westward.

3. At the Copper Mines, in the Rocky Mountains (afterwards Fort Webster), at an elevation of six thousand two hundred feet above the level of the sea, the latitude and longitude were determined by Lieutenant Whipple, and the meteorological observations continued by Mr. Henry C. Force, assisted by Mr. James H. Houston.

While the Commission was waiting for Colonel

* The latter accompanied the parties, and soon after his arrival at El Paso left the Commission. Mr. Pratt came up with a train a few months later, and took a large number of sketches.

Graham, a party under the charge of John Bull, Esq. first assistant surveyor, made a reconnaissance of the country between the Rio Grande and the Gila, in which a more direct road was opened from Doña Ana to the Copper Mines. This reconnaissance was extended to the Presidio of Janos, in the State of Chihuahua.

5. The southern boundary of New Mexico, extending west three degrees from the Initial Point on the Rio Grande at $32^{\circ} 22''$ north latitude, and from the western termination of the line due north to the Gila, was surveyed exclusively by Lieutenant A. W. Whipple and his assistants. This officer also surveyed the river Gila, from the point where it is intersected by the before-mentioned line to its junction with the Colorado, a distance, including the sinuosities of the river, of about four hundred and fifty miles, making together between six and seven hundred miles from the Rio Grande to the Colorado. The boundary along this parallel was the most difficult part of the whole survey.

Astronomical observations were made during the survey of the Gila every night but two, which were cloudy. The whole number of astronomical and meteorological stations was about sixty; nearly all of which were also magnetic stations. To these it is proper to add that there were three astronomical and magnetic stations, besides several made by Lieutenant Whipple on his trip from San Diego to the Colorado, in September, 1849, thus completing a consecutive chain of points of observation by this officer extending from the Atlantic coast, via San Antonio, El Paso del Norte, and the mouth of the Gila, to the Pacific Ocean.

At most of these stations the three elements of inclination, declination, and intensity were observed.

6. A chain and compass survey was made by A. B. Gray, Esq., Principal Surveyor, his first assistants being John Bull and J. H. Prioleau, Esqs., from the point where the southern boundary of New Mexico strikes the river Gila to a point about seventy miles above its junction with the Colorado, about four hundred miles. This survey was independent of that made by Lieut. Whipple.*

7. In returning from San Diego, California, the unfinished portion of the survey of the Gila was completed by Lieut. Whipple; after which our parties again united at the Pimo Villages, on the Gila. We then returned together to El Paso by a different route from that taken on our journey out, thereby enabling us to collect much valuable information in the northern portions of Sonora and Chihuahua not previously explored by a scientific party. On this journey or reconnoissance (to use a military term), of which a detailed account is given in this work, an elaborate series of astronomical and meteorological observations were made by Lieut. Whipple in the same manner as those before mentioned. The true position in latitude and longitude of Tucson, Tubac, Santa Cruz, Guadalupe Pass, Janos, and Correlitos, besides intermediate points, was then first determined by this officer; and the mountains, streams, and other geographical features

* I regret that I am unable to speak more fully of this survey, as Mr. Gray has never furnished me the details or made any official report to me.

of this hitherto unknown region, were accurately delineated upon the maps.

The barometrical profiles constructed by Lieut. Whipple, and the minute topography of the maps laid down in the two extensive journeys in which this officer accompanied me between the Rio Grande and the Pacific, are of the highest importance as showing the practicability of a route for a railroad or other public highway south of the Gila. In order to render this information immediately available, a reduction of the astronomical and meteorological observations has already been made, as well as barometrical profiles of these several reconnoissances.

The surveys of Mr. Gray and Lieutenant Whipple, and the astronomical observations made by the latter in the journeys to and from California, have enabled the Commission to lay down with accuracy for the first time the geography of the Gila and of the vast region between the Rio Grande and the shores of the Pacific.

The plot and topographical sketches of the survey between the Rio Grande and the Colorado were mostly completed in California and transmitted to Washington. At the same time reports of various reconnoissances made along the line, with tables of astronomical, magnetic, and meteorological observations by Lieut. Whipple were forwarded. These plottings, reports, and tables were placed by me in the hands of Major Emory, Principal Surveyor, on my return to Washington; and engineers and draughtsmen have since been engaged in completing the maps, and reducing the observations, under his direction.

8. Along this line an extensive series of sketches

and drawings were made by Henry C. Pratt, Esq., draughtsman and artist to the Commission, which exhibit the characteristic features of the regions visited, including the mountain passes, outlines of the mountain chains as they presented themselves to us from different points, etc., etc.; and convey a far more comprehensive idea of the physical geography of the zone of country traversed than can be given in any written description. To this department of our work I devoted some of my leisure moments, particularly in journeys on which I was not accompanied by Mr. Pratt.

Of the labors of the parties on the Rio Grande or Bravo Del Norte, I have now to speak. These parties were all placed by me under charge of Brevet Lieut. Col. J. D. Graham, of the Topographical Engineers, Principal Astronomer and Head of the Topographical Scientific Corps, a programme of which will be found in Appendix F. This officer was detailed for service on the Boundary Survey, on the 23d October, 1850, and reached the Head Quarters of the Commission at the Copper Mines, New Mexico, the nearest point to our field of operations, on the 2d of August, 1851. He was recalled by the Hon. Alex. H. H. Stuart, Secretary of the Interior, on the 13th of September of the same year; and on the same day, Brevet Major W. H. Emory was appointed to his place. The latter reached El Paso on the 25th of November, and delivered the order of recall to his predecessor.

Major Emory, in his letter to me under date of June 1st, 1852,* informing me of the work performed

* Senate Document, No. 6, Special Session, 1853, p. 42.

by his predecessor, says, "A survey of the river had been commenced by Colonel Graham, at the Initial Point, and prosecuted as far as the Paso del Norte, and an observatory partially erected at Frontera, and information given me by Colonel Graham that Frontera, a cardinal point in the survey, had not yet been determined. *I also found it necessary to resurvey the river down to Frontera.*" *

Deducting, therefore, the re-survey which Major Emory deemed necessary, there remain the eight miles from Frontera to El Paso, to be placed to the credit of Colonel Graham. The results of the labors of Major W. H. Emory, after taking charge of the Survey of the Rio Grande, were reported to me by that officer as follows. †

The determination of the latitude and longitude of San Eleazario and Frontera, which had previously been determined by one of his predecessors, Lieutenant Whipple, while acting as Chief Astronomer.

The determination of the latitude and longitude of the cañon one hundred miles below San Eleazario, the

* I should do injustice to Mr. Prioleau, a meritorious officer, did I not state, that when directed to make a survey of the Rio Grande from El Paso to the Initial Point, he declared it would be impossible to perform the work correctly with the instruments at his command. Another undertook it; the Survey was made and set aside. On Colonel Graham's arrival, another survey was made under his immediate direction, and afterwards rejected by his successor Major Emory. The latter placed the work in the hands of Mr. Radzimirski, Principal Assistant Surveyor, by whom it was executed in a highly satisfactory manner, and accepted as the official Survey.

† See Letter from Major Emory to J. R. Bartlett. Senate Doc. Special Session, 1853, No. 6, p. 58.

Presidio del Norte, Eagle Pass, and Loredó; the latitude of various intermediate points was determined by the sextant, and the approximate longitude by the passage of chronometers.

“The survey of the river from El Paso to the Presidio del Norte, was completed by Assistant Von Hippel.

“The survey of the river from Eagle Pass to Loredó, under the orders of Lieutenant Michler.

“The survey of the river from Eagle Pass to the mouth of the Pecos, by Assistant Schott.

“The survey of the river from Presidio del Norte to Fort Vicente by Assistant M. T. W. Chandler.

“The re-survey of the river from Frontera to $32^{\circ} 22'$, by Principal Assistant Charles Radzimirski.”

The length of these several surveys, may be stated approximately at one thousand miles.

The following recapitulation will show the extent of the surveys, and by whom performed, during the period the Commission was under my charge.

By Lieutenant A. W. WHIPPLE.

My successor, General Robert B. Campbell, took the field in May, 1853; and under his orders, the survey of the Rio Grande from Loredó to its mouth, and a portion in the cañon of that river, was completed before the close of the year.

In the department of Zoology, much has been accomplished by officers of the Commission. The collectors were Mr. J. H. Clark, Dr. Thomas H. Webb, and Mr. Arthur Schott.

A large collection of fishes was made in the waters of the Rio Grande, and in the tributaries of the Gila and the streams to the south of it, by Mr. Clark, a large portion of which have proved new to science. Many of these have already received a sort of publicity through the proceedings of the Academy of Natural Sciences. Among them are some new genera. Representatives of the families *Labridae* and *Characini*, were detected in the waters of the Rio Grande.

A considerable number of reptiles were collected by Messrs. Clark and Schott, embracing new genera and species, which have already been described by Professors S. F. Baird and Charles Girard, in the Proceedings of the Academy, and their "Catalogue of North American Serpents," published by the Smithsonian Institution. In speaking of the collection sent home by Mr. Clark in the spring of 1852, these distinguished naturalists remark, that "It will be perfectly safe to say, that one hundred undescribed species of North American vertebrate animals have been added to our fauna. The entire annals of zoological history scarcely present a parallel to this case."

Dr. Webb made an interesting collection of fishes,

reptiles, and insects, the particulars of which are unknown to me. Mr. Schott, also, collected many interesting insects of the orders *orthoptera* and *coleoptera*, part of which have been described by Dr. John L. Leconte. In birds, and the smaller mammalia, some interesting specimens were collected by each of the gentlemen named.

When fully studied and described, these collections, it is expected, will furnish new and interesting facts respecting the distribution of animal life in the country explored; and if properly illustrated by figures, they will constitute a most valuable contribution to our knowledge of the animals of that portion of the United States.

Botanical collections were made by Dr. J. M. Bigelow, Mr. Charles Wright, Mr. George Thurber, and Dr. C. C. Parry. Dr. Bigelow's collections were made upon the road between Indianola and El Paso, in the vicinity of the Copper Mines, and upon the Rio Grande. He also made an excursion to Lake Guzman and other points in pursuit of specimens in his branch of natural science. His collection has not, to my knowledge, been reported upon; but from the zeal and enthusiasm with which that gentleman prosecuted his researches, there is no doubt that it contains much that is valuable. Mr. Wright accompanied Colonel Graham in his travels; and his connection with the Commission ceased soon after the removal of that officer. A portion of Mr. Wright's collection has been published by Dr. Gray among the Memoirs of the Smithsonian Institution, and contains many new genera and species. Mr. W., whose name is identified with the botany of Texas and

Northern Mexico, is now engaged in the Ringgold Exploring Expedition, and, by his devotion to the botany of the regions visited, will doubtless contribute largely to the value of the scientific results of that enterprise.

Mr. Thurber, though for the greater part of the time acting as quarter-master, made a large collection, the examination of which has not yet been completed. Some six or seven unpublished genera have been determined, and a corresponding number of new species. As he collected in localities afterwards passed over by Mr. Wright, and a portion of the time in company with that gentleman, many of the novelties in his collection have been anticipated in the memoir alluded to. As Dr. Parry was engaged with a portion of the Commission under Major Emory, I had no opportunity of acquiring a personal knowledge of his labors; but from his reputation as a botanical observer, I have no doubt that he improved successfully the opportunities his field presented.

The geological collection was made by Dr. Thomas H. Webb, Secretary of the Joint Commission. This officer was indefatigable in his labors to collect a series of specimens that should illustrate the structure and mineral resources of the vast region traversed by the Commission; but the collection made on the journey from the Copper Mines of New Mexico to California was mostly lost, in consequence of the abandonment of the wagons and the perishing of the animals. A few boxes of minerals, were, however, collected in California and sent home in safety by water. On the journey from the Pacific coast, by the Gila and El

Paso, and thence through Chihuahua and the Mexican States to the south, Dr. Webb was enabled to make a collection of fossils and minerals, including some choice specimens of gold and silver ores, which were brought home in safety. A collection of fossils and minerals in the valley of the Rio Grande was also made by Mr. Arthur Schott.

In ethnology the collection was made almost exclusively by myself. This consists of vocabularies, each embracing two hundred words, in upwards of twenty Indian languages. Many of these had never been taken down before, and few as fully as by me.

Further to illustrate the aboriginal tribes, I have obtained accurate and characteristic portraits of many individuals seen, both male and female, with sketches exhibiting their manners and customs, their arts, husbandry, etc.

I had prepared an extended disquisition on the semi-civilized tribes occupying the vast basin between the Rocky Mountains, or rather the Rio Grande, and the Colorado of California; but the subject was found to be so extensive and so deeply interesting, that I determined to reserve it for a special report, which I intend to prepare on the ethnology of the Indian tribes of the extensive region explored by the Boundary Commission, in which also my Indian vocabularies will be embraced.

By the preceding statement it will be seen that no exertions were spared, and no suitable opportunities omitted, to do all in my power to advance the cause of science. It now remains for the government to take such measures as it may deem proper to lay the results

of the Commission, obtained with so much labor, with so much expense, and with so much personal suffering and privation, before the American people and the scientific world.

NOTES.

NATURAL HISTORY.

The Natural history of the regions traversed—Animal life on the deserts—Quadrupeds—Reptiles, their great variety and numbers—Peculiar vegetation of the deserts—The “Prairie Dog” and its habits—The antelope, etc.

HAVING but incidentally spoken of the Natural History of the countries I passed through, I now propose to give some brief notices of the most remarkable animals that were seen from time to time.

In a region as barren as the greater portion of that traversed, animal life would hardly be expected to abound. Nevertheless, there was no spot, however barren, or however distant from water, where rabbits and wolves were not seen. On these plains, whether desert or grassy, there are fewer birds. Often, for days together, nothing of the feathered tribe was seen except the omnipresent crow. Living equally well on animal food, seeds, or roots, there is no place where he may not thrive.

In the mountains and along the water-courses, where there are more or less forest trees and shrubbery, both quadrupeds and birds are found in greater variety. Among the former may be mentioned the leopard, cougar, ocelot, lynx, panther; the brown, black, and grizzly bear; the fox, antelope, and various kinds of deer; the large wolf (*lobo*), and the coyote, raccoon, skunk, marmot, weasel; a great variety of moles, rats, and mice,

which harbor in the ground ; hares, rabbits, squirrels, Rocky Mountain sheep, etc. These several animals, of course, have their particular localities. The elk is not found south of the Gila. The beaver is still met with on the Pecos, the Rio Grande, the Gila and its northern tributaries ; and within a mile of El Paso I saw evidences of his labors. In the Copper Mine region, which is in the Rocky Mountains, almost every animal that I have named may be found ; bears in particular are extremely abundant.

But while the parched and desert plains are so destitute of quadrupeds and birds, they abound in reptiles and insects in the greatest variety. *Lizards* of every size and color, from one and a half to eighteen inches in length, are found here ; all of which are harmless. Then comes the family of "*horned frogs*," which are allied to the chameleon and lizard. Of these harmless little creatures, all covered, as a means of defence, with sharp horny projections, there is also a great variety. Next to these, come the poisonous reptiles. First is the horrid *taran-tula*, with his hairy body as large as a pigeon's egg, and with legs as long as one's finger, striding over the ground and nestling under one's blankets at night. His sting, or bite, sometimes causes death. His habitation is in the ground, the opening to which he covers over with a trap-door. There are other large spiders that also harbor in the earth, and protect the entrance to their abodes in the same manner. Next are the white and the black *scorpions*, the former of which are very abundant. These are from one and a half to two inches in length. The sting of the black variety is sometimes fatal. The white ones were often found in the boots of the men, into which they crept at night, and were not discovered until they stung the foot. A sharp pain was the consequence for a few hours, or perhaps a day, when it passed off. These creatures were sometimes found in our beds in the morning.

But perhaps there is no more hideous-looking reptile infesting the plains than the *centipede*. These are from three to ten

inches in length, and are exceedingly poisonous, sometimes fatal. Then there is the *venagron*, as the Mexicans call it, a black insect about two inches in length, also very poisonous; and lastly, the *alacran*, a species of scorpion, the most venomous of all. These last, fortunately, are chiefly confined to the city of Durango; where, owing to their numbers, and the fatality which attends their sting, a bounty of six cents is given by the government for every one killed. We close this catalogue with the *rattlesnake*, which needs no description. This creature is found every where, from the Gulf of Mexico to the Pacific, alike in grassy, rocky, and desert regions. Hundreds of them were killed by our party; yet I am not aware that any of us were bitten. Two horses that were bitten died. All the other reptiles and insects of which I have spoken are found throughout the countries contiguous to the Boundary, and were seen almost daily. Thus has nature adapted a numerous class of animals for the otherwise solitary desert, where they enjoy undisputed sway. These plains also abound in moles, rats, mice, rabbits, and other burrowing animals; sometimes to such an extent, that it is dangerous to pass over them with horses and mules. Many specimens of the lesser mammalia were brought home by the Commission, as well as a collection of reptiles and insects. Of reptiles, a very large number was discovered which are entirely new. This collection is now in the cabinet of the Smithsonian Institution at Washington.

One of the most interesting animals met with on the prairies and high table-lands, is the "prairie dog," which is in fact no other than a marmot, having no character in common with dogs. Its look and habits are totally different. The Canadian trappers used to call it a "petit chien;" and this, together with the noise it makes, which however, is more of a chirp or yelp than a bark, has caused it to receive the name of 'prairie dog.'

The first community of these little creatures we met with was in Texas, near Brady's Creek, a branch of the Colorado

of the east. This was the largest we ever saw, nor have I ever heard of one as extensive. For three days we travelled through this colony, during which time we did not lose sight of them. On either side, as far as we could see over the plain, their habitations extended, standing out in bold relief in the little hillocks they had raised with the earth brought from their subterranean abodes. Their habitations are usually about ten yards apart, and the hillocks contain from one to two cartloads of earth each. Some have one entrance, others two, which incline at an angle of about forty-five degrees. To what depth they extend I could never learn, and only know that the frequent attempts to drown the animals out by pouring large quantities of water in them, have rarely succeeded.*

A well-beaten track extends from one to the other of these hillocks, showing that a close intimacy exists between their occupants, or perhaps family connection. We supposed this community or "dog-town," as it is called, extended at least sixty miles, as we travelled at that time twenty miles a day. As to its width, we could not form a decided opinion; but presuming it to have been only half as wide as it was long, an idea may be formed of the vast number of animals it contains.†

For the greater part of this distance the country was flat, and covered with short grass, kept so probably by these ani-

* Lieutenant Abert mentions an instance where several were obtained by pouring water into their burrows. They afterwards became quite tame.—*Report*, p. 421.

† If we suppose that this community extended fifty miles in one direction and but ten in another, we have a superficies of five hundred square miles; and allowing them to be thirty feet apart, or nine hundred square feet for each (a large allowance), it would give about thirty thousand habitations to the square mile, or 15,000,000 in the five hundred miles. Estimating but two of these little creatures, which is the smallest supposable number to a habitation, we have a total of thirty millions in this community. I think it would be quite safe to reckon three or perhaps four animals to each hillock.

mals feeding on it. A few scattered mezquit trees also grew among them. Rivers did not limit the colony ; for they were found on both sides of several streams. In several places I noticed a colony on the summit of elevated plateaus or hills, where the country was exceedingly barren, and the herbage so scant as to appear entirely inadequate to their subsistence. In this case it was evident that the colony was not in a flourishing condition, as many of the habitations were deserted.

Of the habits of these animals I can say little from observation, although I saw thousands of them. I would gladly have taken a day to conceal myself near them for the purpose of watching their actions, but when in the most interesting places we were moving forward. Major Long, in his Expedition to the Rocky Mountains, says they pass the winter in a lethargic state. Other travellers deny this, and say that they come from their holes during the winter whenever the weather is mild. I saw them out on some pretty cold days in November. Even in the plains further to the north, where snow lies on the ground for weeks, and where the cold is severe, they are seen out during the winter.

Where they obtain water has puzzled naturalists. Some travellers say that they dig down until they find it. This cannot be the case ; for I have seen them on dry elevated plains, twenty miles from water, and where there was no dew.

The color of the prairie dog is light brown. The lower part of its body, with the face and neck, are of a whitish yellow. Its size varies from that of a gray squirrel to that of a northern woodchuck, which it resembles in form more than any other animal. The body of a full-grown specimen is about twelve inches in length ; its tail, which is bushy, between three and four. It stands erect like a squirrel, with its tail in constant motion, particularly when seated upon the top of its hillock chirping to its companions. As we drew near their villages, an alarm seemed to be given by one placed as a sentinel on a hillock in the outskirts. As soon as the signal

was made, a general scampering to get home took place among them, some running in one direction, some in another. When they reached their habitations, they would stand erect at their entrances, with their heads just peeping above, and keep up an incessant chirping and frisking of their tails until we passed. As we drew quite near, some of them would turn a somersets into their holes and disappear.

We found it difficult to secure them; for they always stood at the entrance of their burrows, so that, if shot, they fell within. I do not think that out of twenty shots sometimes fired at these creatures, more than one specimen was obtained.

This marmot is said to be good food; but at the time we killed those referred to, our provisions were abundant, and no one could be induced to try them. Subsequently, when we got on short allowance, I do not think any one would have hesitated to eat them.

Rabbits often burrow with these animals, or, what is more probable, they occupy habitations made by the latter. The habits of a rabbit lead him to places where there are more shrubs, and not a bare plain. It is probable, therefore, that the rabbits seen among the prairie dogs are merely wanderers, who have strayed away from their proper abodes, and finding comfortable quarters already provided, without the labor of burrowing themselves, have driven away the weaker animals and taken possession of their dwellings.

A small brown owl also resides with the prairie dogs, and is almost always found standing on their hillocks, acting perhaps as a sentinel, for which the community has to pay dear. He is undoubtedly an interloper; as, from the known habits of this bird, one of which is its fondness for ground mice, moles, and other small quadrupeds, it doubtless seeks the habitations of the prairie dogs to feed on their young. The parent dogs can have little courage to permit a diminutive bird like this to prey upon their offspring.

But the most serious interloper in the dog-towns is the

rattlesnake. I had often heard that this reptile was found among them, and thought it must be accidental, until I witnessed how frequently it occurs. On one occasion I saw several of those revolting creatures enter a single hole in the very midst of a dog-town. No one can believe that any friendship exists between animals of such opposite natures ; and it cannot be doubted that the rattlesnake takes up his abode among them for sinister purposes. They cannot drive him away, and are therefore compelled to give him quiet possession of any habitation he may enter, and allow him occasionally to feed upon the junior members of the fraternity.

I have seen the prairie dogs in Texas, New Mexico, Chihuahua, Sonora, and California.

During our various journeys we encountered numerous herds of antelopes on the plains. Several were shot and found to be excellent eating. They are more timid than the deer, and a good deal of stratagem is necessary to secure one.

The antelope is considered a more beautiful animal than the deer. Its legs are more slender, and its body of different colors, light and dark brown, red with a white belly, spotted, and sometimes pure white. Their horns are quite short and consist of a simple curved stem without branches. Catlin, I think, in his *Wild Sports of the West*, speaks of the curiosity of the antelope's disposition, and of a method resorted to by hunters to entrap or shoot it. This is to affix a piece of red cloth to a pole and insert it in the earth. The animals see it as they bound over the prairie, turn from their course, and timidly approach it, some venturous buck leading the way. The rest of the herd follow him in single file, after the old established custom of the prairies. In the mean time the hunter has concealed himself in the grass, so that, when the herd approaches, he selects the fattest for his mark. It sometimes happens that several are thus killed from a single herd. One of the members of the Commission tried the experiment of lying in wait for a passing herd. As they approached he shot

one. The frightened animals ran a short distance, and then stopped and turned round to see what the mysterious noise was that had so alarmed them. They even returned to the spot where their dead comrade lay. A second shot brought another to the ground. The herd, again startled at the report of the rifle, loped slowly away a short distance, and once more returned to the fatal spot, when another was brought down. The sportsman now rose from his place of concealment and secured his three animals. How long they would have continued to return, I know not. He had but three bullets with him.

In some parts of Texas deer are so abundant that it ceases to be a sport to kill them. Neither skill nor ingenuity is required, and even the usual caution of the practised sportsman is unnecessary. Such is the case on the lower road from San Antonio to El Paso, at a stream called Turkey Creek. Here the train stopped one day to rest, when twenty deer were killed and brought to camp. After leaving the Rio Grande we found none until we reached the Rio Mimbres, where again they became numerous. Beyond that we found them in the mountains and along the bottom-lands of the Gila, but not in large numbers.

On the whole, game, both animals and birds, was scarce throughout the broad regions traversed by us, except in the mountain districts, where it was abundant. In California, however, after reaching the rich valleys and timbered country, it is found in still greater quantity and variety; but my stay was so short there, and my journeys confined to so limited a district, that I am unprepared to testify except to the general fact.

In noticing the distribution of animals over the desert regions which occupy so large a space of the interior of our continent, it will have been observed how beautifully nature has adapted them for these districts. Here man, the terror of all animals, cannot live; for there is no soil that he can cul-

tivate, no water to slake his thirst, no wood to supply him with fuel ; nor can the domestic animals so necessary to him exist. But while these inferior animals have such undisputed sway unmolested by man, their lives are, nevertheless, attended with other dangers. It might be supposed that the venom of the tarantula, the centipede, the scorpion, and the rattlesnake would effectually preserve them from all enemies. But such is not the case. A most voracious bird is found here, called by the Mexicans the "*paysano*," and by the Americans the "*chapporal cock*," which feeds on these hideous creatures. He even ventures to attack the rattlesnake, and, as if aware of the latter's venom, protects himself from its fangs by using his wing as a shield. Many instances have been related to me by eye-witnesses of contests between the rattlesnake and this bird, in which the latter always came off conqueror. His aim is to seize the reptile by the back of his neck, when he may be considered as vanquished. With the exception of this bird and the hog, every animal has an instinctive dread of rattlesnakes, and will fly at their approach. The hog eats them with impunity. Other dangers attend these reptiles from crows, buzzards, and hawks ; while the serpent tribe get their living on the lizards and frogs.

Another peculiarity of the desert is its remarkable vegetation ; every thing being armed with thorns. First comes the endless variety of cacti, to look at some of which will make one shudder. These are seen from the tiny plant not larger than the finger to the giant petahaya raising its tall stem to the height of fifty feet. Then come the mezquit or acacia, the tornilla, the fouquiera, the agaves, and yuccas, all armed with the most terrific spikes or thorns. Even among the tender grasses, the mezquit has its minute thorns. But these thorny and angular forms are not confined to animal and vegetable life : they seem to be extended to nature even in the grandest aspect in which she here appears. The mountain ridges, as I have before observed, present the most singular summits,

terminating in pyramidal points, or resembling towers, minarets, etc. Thus is every thing in these regions peculiar. To indemnify man for the inhospitable deserts and barren soil which occupies so large a space, nature furnishes, embowelled in her innumerable mountains, the greatest variety and abundance of precious metals. The vast riches embedded in the great "Sierra Madre" are as yet little dreamt of; but I do not hesitate to say that for wealth of this description even California will yet have to yield the palm to these mountains.

Without entering into particulars about the variety of fishes brought home, I will merely observe, that while at San Diego, California, in May, 1852, Dr. Webb caused a seine to be drawn in the bay, which brought to light some exceedingly interesting specimens, and among them several which, on being opened for the purpose of better preserving them in alcohol, were found, to our great surprise, to contain each ten or twelve living young. They excited much attention at the time, being the first evidence brought to light, as far as we were aware, of the existence of viviparous fishes.

The public has been informed of the subsequent discovery of similar fishes in the Bay of San Francisco; but of those found by us in the Bay of San Diego no description has yet been given. Our specimens, after being kept alive in water several days, were sent with other objects of natural history to Boston, where they safely arrived.

ADAPTATION OF THE COUNTRY FOR A RAILWAY.

Brief remarks on the Geography of the countries traversed by the Boundary Commission, and upon their adaptation for a Railroad connecting the Atlantic with the Pacific.

FROM the Rio Grande eastward, between the parallels of 30 and 34 north latitude, lies the great plateau of Texas,* extending more than three hundred miles. Further north it is known as the *Llano Estacado*, or Staked Plain. This broad district is destitute of forest trees and shrubbery, except along the immediate margin of the water-courses. The belt of forest even here is exceedingly limited, being often confined to the very banks, and never extending a hundred yards from the stream. In this region the Red River, the Brazos, and the Colorado have their rise; but it is not until they have coursed for some hundreds of miles that their banks present any considerable extent of bottom land with its accompanying forests. As they descend from the high table, the valleys expand, the land becomes more fertile, luxuriant valleys appear, and forests of oaks extend for miles.

The plateau bears but little grass, and this a short stunted variety, which, after rains, shoots rapidly up, and as speedily becomes dry, affording but little sustenance. Without water and grass this arid belt is an effectual barrier to the progress of the buffalo, which otherwise would cover in myriads the plains of Lower Texas.

* A large portion of this desert plateau is now included within the territory of New Mexico, having been transferred to the United States by purchase.

About the parallel of $29^{\circ} 30'$ the table-land breaks off into numerous spurs, descending to the great plains or prairies, which extend to the shores of the Gulf of Mexico in a broad belt from one hundred and fifty to two hundred miles in width. The whole of this district consists of gently undulating plains without timber, save along the margins of the streams, and is covered with the most luxuriant grass. The eastern portion of this plain is watered by numerous streams, and in fertility is unsurpassed by any portion of the globe. The western and south-western portion is deficient in water-courses. The Rio Grande possesses few tributaries here worth notice ; and south of the Nueces, the streams entering into the Gulf are quite diminutive. But for grazing and rearing large herds of cattle, the land is unsurpassed ; and it is evident, from what we saw of wells sunk in the midst of these plains, that water can be found any where within a hundred feet of the surface.

“The indigenous prairie grass is tall, coarse, full of seed at the top, and when young resembles wheat in the spring. But in grasses the glory of the State is the *mezquit*, found only in Western Texas. It yields a fine soft sward, preserves its verdure in the winter, and beyond all comparison affords the best wild pasture in the world. It has also the peculiar property of retaining its nutritive quality after it has become hard and dry.”

West of the Rio Grande, from about the thirty-fourth parallel to the Gulf of California, and, I may add, to the shores of the Pacific, and thence south for eight hundred or a thousand miles, this vast region is but poorly adapted to agriculture. It is destitute of forests, except in the higher regions of the Sierra Madre, or great chain of the Cordilleras, or in the defiles leading to them. Timbered land is also found in narrow strips along the water-courses ; but these cannot with propriety be termed forests. There are also valleys between parallel ranges of mountains, sometimes two or three miles in width, which derive some moisture from the mountains, where

the mezquit and live-oak attain a considerable size. Grass appears only at intervals. The high table-land of Chihuahua exhibits it in the greatest quantity ; but even there it is not continuous. Sometimes it is found spreading over districts fifty or more miles in extent, when a barren interval of thorny chapporal appears, and for miles a blade of grass is not to be seen. Upon the whole I feel safe in saying that of the elevated plateau not more than two thirds can be called a grazing country. But even this presents a vast surface, extending from about the parallel of $32^{\circ} 40'$, where the Rocky Mountains suddenly drop off near the Copper Mines of New Mexico (now Fort Webster), to the twenty-sixth parallel. The water-courses here run towards the north, and discharge themselves into lakes which have no outlets. The Conchos alone, a stream which is as large as the Rio Grande, and has many tributaries, discharges itself into that river. It is in that portion of Chihuahua which forms the eastern slope of the Sierra Madre, as I have before said, that the best arable and timbered land is to be found. This, for a mountainous district, is well watered.

The district south of the river Gila, between the Rio Grande and the Pacific, for about one hundred and fifty miles in width, is of the most barren character. The summit of the great ridge or plateau is covered with a short grass. On leaving this and proceeding westward come broad plains, with but little vegetation, save the stunted mezquit and other plants common to these arid regions. This broad belt extends to the Pacific, and is crossed at intervals of from fifteen to thirty miles with short and isolated ridges of mountains from one thousand to two thousand feet above the plain, running from north-west to south-east. These at a distance appear like a continuous chain ; but on approaching them, they are found to be in short ridges from five to ten miles in length, overlapping each other and affording easy passages across. In this respect these chains differ from the mountain ranges both at

the north and at the south. Coming from the north, they present but few openings until they reach the parallel of about $32^{\circ} 40'$, where they suddenly fall off eight miles south of Fort Webster and disappear entirely. At Fort Webster,* between the Gila and the Rio Grande, these mountains attain a height of more than eight thousand feet above the level of the sea.† They rise in peaks, separated by narrow and intricate valleys, and maintain this character until they terminate on the plateau, as stated. This plateau extends southwardly through the greater portion of Mexico.

In about the latitude of $31^{\circ} 15'$ north, the great Cordillera range again begins to appear on the western border of the table-land, and is as it were the concentration of many lesser ridges into one vast chain, elevated, compact, and impassable, extending through the entire length of New Mexico to the Cordillera of the Andes in South America. The wagon road of Colonel Cooke, followed by the Commission, crosses a spur of the Sierra Madre here. A second pass, for mules only, exists a short distance further south, connecting Correlitos with Babispe; after which there is no passage through, nor can these mountains be crossed again with mules for several hundred miles.

The river Gila, from its source to a point about fifty miles below where the San Pedro enters, is closely hemmed in by lofty and impassable mountains. After this they appear only at intervals, and not in continuous chains. The rest of the valley of the Gila is quite open to its junction with the Colorado. The mountains in a few instances reach the banks of the

* Fort Webster was established at the Copper Mines, or *Santa Rita del Cobre*, after they were abandoned by the Boundary Commission in October, 1851.

† Mr. Henry C. Force, the indefatigable officer in charge of the meteorological department attached to the astronomical party of Lieutenant Whipple, ascended to the highest summit of the *Bufa del Cobre*, near our encampment, with a barometer, and ascertained its height to be seven thousand nine hundred and ninety seven feet above the level of the sea, and one thousand eight hundred and one feet above the valley where we were encamped.

river ; but they are passed by following the valley of the river or other openings through them.

No stream enters the Gila on the south side after the San Pedro is passed. There is a small water-course known as the Santa Cruz River, which rises in some springs near the sources of the San Pedro, and which, after a course of less than a hundred miles, is lost in the desert near Tucson. Near this are good lands, which by irrigation are rendered fertile. We have, therefore, a space of about two hundred and fifty miles without a water-course or arable valley except the Santa Cruz, and nearly one hundred and sixty miles before any considerable stream is reached at the south, in the State of Sonora. This wide region is of the most barren and desert-like character, consisting of arid plains, with short and detached ridges of mountains at long intervals.

The water-courses of Sonora take their rise in the Sierra Madre and in the mountains at the north. Those which rise in the former, receiving a more copious and constant supply of water, reach the ocean ; while the streams in the northern portion of the State, after traversing arid deserts, and forcing their way through lofty mountains for three or four hundred miles, lose so much by evaporation that they do not reach the sea, but are swallowed up in the sands of the desert or *ciene-gas* (marshes). These streams lose much, too, by irrigating the cultivated valleys through which they run.

Except along the bottom-lands of these streams, there is no arable land in Sonora. What there is, however, is exceedingly fertile, and yields enormous crops. Owing to the rapid descent of the streams, the water is easily controlled and conducted by irrigating canals over the arable lands ; so that every considerable land-owner may have his own canals. In the northern portion of the State, near the Gila, there is but little tillable land. The best portion of it is that occupied by the Pimo and Coco-Maricopa Indians. In portions of the Santa Cruz and San Pedro valleys are good lands, but the

quantity is small ; and the latter is rather a grazing than an agricultural district.

In about the latitude of 31° the water-courses of northern Sonora begin to appear, and with them the luxuriant valleys, through several of which I found my way across the country to the Gulf. Those streams, though denominated rivers, would scarcely be characterized as such in the United States ; the term *rivulet* would be far more appropriate.

As regards the construction of a railway through Texas, the country is entirely open and generally level. The first elevation to be passed, following the parallel of 32 degrees, is Castle Mountain, about ten miles east of the river Pecos, which may be avoided by diverging either to the north or south. After crossing the Pecos, the route should be south of the Guadalupe range of mountains, a lofty and continuous chain, which, coming from the north, where it is united by the Sacramento range, terminates abruptly in about $31^{\circ} 50'$ north latitude. South of these mountains, the country is quite open and apparently level, with isolated mountains at long intervals, but no connected chains. For the hundred miles which we followed the Pecos, there were neither hills nor mountains, and this character of country extends to the Rio Grande. A mountain chain, called the "Sierra de los Organos," crosses this river near El Paso, and extends north for some eighty miles. These mountains may easily be passed through where the river has opened a way for itself near El Paso, and again about forty miles to the north. But surveys must determine whether, in coming from the Mississippi, a route near the parallel of 32 degrees, or along the Colorado or Canadian rivers, will be more practicable.

After crossing the Rio Grande, should a point north of El Paso, between the latitude of $31^{\circ} 53'$ and $32^{\circ} 20'$ be selected, there is an open country for more than one hundred miles. Some mountain ranges are then to be passed, through easy slopes or defiles, and in no case by surmounting them. In fact,

so gradual are the ascents and descents, that they are scarcely perceived. After they are passed, broad, open, and level plains occur, where for miles very slight embankments or excavations will be required for the construction of a road.

If, on examination, it is not deemed advisable to cross the Rio Grande within the district named, we must then strike it about twenty-five miles further south, near San Eleazario, thence across the basin of that river to the table-land beyond and south of the mountains which lie west of El Paso. Broad level plains again occur here without any continuous mountain chain.

An idea has arisen that the line of Colonel Cooke's road is a practicable one for a railway. This is a great mistake. That road crosses a spur of the Sierra Madre with a descent of from twelve to fifteen hundred feet in ten miles, all of which is avoided by keeping some ten or twenty miles to the north. In fact, my route with the engineering parties across this district, as detailed in this narrative, diverging occasionally a few miles, will be found a practicable one.

The first barrier of consequence, of which I cannot speak with certainty, is a range of mountains beyond the San Pedro river, bounding the Santa Cruz valley on the east. They terminate in latitude $31^{\circ} 15'$ where our parties passed them. Between 32° and $32^{\circ} 22'$ they are passed by wagons, but I cannot state with what facility. If an opening exists any where between the 32d parallel and the Gila, the last obstacle to reaching the plateau near that river is overcome. Here is an open level plain, from one hundred to one hundred and twenty miles across, to the river mentioned. In fact, it may be said that when the San Pedro Mountains are passed, we shall have an uninterrupted plain of about two hundred and fifty miles to the Colorado.

It will thus appear, that the entire district from the Rio Grande to the Colorado, which may be put in round numbers at five hundred miles, consists of broad, open, gravelly plains, from fifteen to twenty-five miles in width, with scarcely an un-

dulation, and for long distances requiring but slight excavations and embankments. The mountains may be passed through open defiles of easy ascent and descent. When the Gila is reached, either the bottom or the table land may be followed ; though the latter will doubtless have the preference, as it presents a perfectly hard and level surface. In a few instances, ranges of mountains approach the bottom-land of the Gila. Openings may doubtless be found through these, or they may be passed by cutting away near the river.

The Colorado River presents no difficulties for bridging. At Fort Yuma, where the Gila joins it, it is about six hundred feet wide, but above and below the junction, it expands to eight hundred and twelve hundred feet. In dry seasons there is between four and five feet of water at Fort Yuma.

After this river is passed, we reach the great California Desert, about one hundred miles across, which increases in width towards the north. This desert is destitute of wood, water, and grass ; it presents a hard level surface with slight undulations, and seems almost graded by nature for a railway. After leaving the bottom or valley of the Colorado, and before the table-land or desert is reached, there is a belt of moving sand. Its southern extremity is now about twelve miles below Fort Yuma, where I passed it with my parties without crossing it. Its breadth is about four, and its entire length, less than twenty miles. This is the only belt of moving sand that I know or within the district referred to, west of the Rio Grande.

On passing this desert, we reach the Sierra Nevada, where a pass must be sought, and for this purpose engineers are now in the field. To reach San Diego, it will be necessary to tunnel the coast range of mountains ; and it is probable that either a tunnel or an inclined plain with stationary engines will be indispensable to cross the Sierra Nevada, in order to strike the valleys leading to San Francisco.

On the broad desert last mentioned, we found water in its very centre in two places by digging. Sluices or basins are

known to exist in several places, which are filled with water at times, by the overflows of the Colorado. In these, by sinking wells, a plentiful supply of water can doubtless be procured.

Should the route of which I am speaking be selected for a railway, supplies could be furnished at several places on the line after leaving the settled portions of Texas. New Mexico and the valley of the Rio Grande would furnish cattle, sheep, mules, flour, and corn. The valley of the Casas Grandes in Chihuahua, is one of the finest wheat and corn districts in the country, and Sonora could furnish an abundance of cattle, wheat, corn, and beans. Supplies may also be taken to the line of the road by the Gulf of California and the Colorado River. The latter, although it has from four to five feet of water near the junction when lowest, is somewhat obstructed by sand-bars towards its mouth; but I have no doubt that steamers, with a light draught of water, may ascend, the greater portion of the year, even for a distance a hundred miles above Fort Yuma. The Gila can never be navigated except in time of floods or high water, when flat-bottomed boats might possibly pass up to the Salinas, one hundred and eighty miles above its mouth. Supplies might be sent, as is now proposed, to Fort Yuma, by sailing vessels to the head of the Gulf of California, and thence by a small steamer up the Colorado.

I have spoken of desert, woodless plains on the line near the parallel of 32° . It is proper to remark that any route south of the parallel of 35° , must cross the great *Llano Estacado*, east of the Rocky Mountains, which increases much in width above the 32^{d} parallel. I crossed it about $31^{\circ} 30'$ or from the head waters of the Concho to the Horse Head Crossing on the Pecos, a distance of seventy miles, without water; but a degree further north, its width is more than doubled. Then the region between the Pecos and the Rio Grande is equally barren (so far as known), and must also be crossed by any route south of the 35^{th} parallel.

So with the great California desert west of the Colorado ; all routes south of the 36th parallel must cross this, even though the Mohavi River be followed, unless the explorations now being made should discover some valley or stream not yet known.

Some observations are necessary respecting timber and other materials requisite for the construction of a railway. Forests and timbered lands extend from the basin of the Mississippi through eastern Texas, and on the slopes leading to the table-land, where they are limited to the margin of the streams. The next are found in the Guadalupe range of mountains, as well as in defiles leading to it, or following a more northerly line, in the Sacramento range. Both pine and oak exist here in abundance. Next, we have the open plains to the Organ Mountains, a chain running north and south about fifteen miles east of the Rio Grande. Here both oak and pine timber are found. Proceeding west across the Rio Grande, the supply of timber must be obtained from the Rocky Mountains in the vicinity of the Copper Mines (Fort Webster). Beyond this, north of the 32d parallel, there are no elevated mountains, and hence no pines. The mountain defiles are filled with oaks of a small size, and the margin of arroyos and streams with cottonwoods. In the valley of the Santa Cruz, between Tubac and Santa Cruz, are very considerable forests of mezquit, the best material for rail-ties that can be found. Next to this is the valley of the Gila, which is only wooded at intervals with cottonwoods and mezquit. For portions of the distance, the use of stone for sleepers or ties, would no doubt be advisable. This material exists in most of the mountains ; and occasionally isolated rocky masses, or "buttes," rise up suddenly from the plain.

I have suggested to civil engineers the use of the roots of the mezquit for sleepers. These roots, even when mere shrubs, are as solid and compact as *lignum vitæ*, and sometimes contain as much wood as a tree of twenty-five feet in height. If

these could be smoothed at the surface and inserted firmly in the ground, they would endure longer than any material ever used for the purpose, except stone ; and the desert regions where there is no timber, would furnish an abundant supply of these roots. The experiment is worth trying.

With regard to water, there are certain indications, even in the most desert regions, by which experienced travellers generally find it by digging. It may be found, too, in every mountain range, and in great depressions on the plains by digging or boring. An examination of the map, or of this narrative, will show what running streams or springs exist, from which to obtain a supply.

From these brief remarks, it will be seen that the advantages of the southern route for a railway, are an open and remarkably level country from the Mississippi to the Sierra Nevada of California—a summit level a thousand feet less than that of the other routes (so far as known)—entire freedom from snows—and convenience in obtaining supplies. The disadvantages are a deficiency of timber, water, and food for animals ; and the want of tillable lands for settlements and farms.

INTRODUCTION OF CAMELS.

Remarks on the Introduction of Camels as a means of Transportation on the Prairies and Deserts of the Interior.

IN traversing the broad plains and deserts of the interior of the continent, the subject of using camels as a means of transportation often occurred to me ; and on my return, I learned that the subject of introducing them had been discussed in the newspapers, and that a resolution had been offered in Congress, asking for an appropriation to test the experiment.

A memoir on the subject, at considerable length, written with much ability, and embracing a vast number of curious, interesting, and important facts, by George R. Gliddon, Esq., was laid before the Committee on Military Affairs of the Senate. This committee asked for an appropriation to enable the Secretary of War to import thirty camels and twenty dromedaries of various breeds, together with ten Arabs, familiar with their habits, whose services might be retained for two years. The plan proposed was to send an efficient agent to Egypt, who was to proceed to the interior of the country, as far as Nubia, and there procure the finest specimens of the best breeds ; for the camel, like the horse and the ox, presents many varieties. On the African coast these animals are found in great numbers ; but they are said to be inferior to those of the interior. If the experiment is to be fairly tested, and made a Government undertaking, of course the very best breeds, both from Africa and Asia, should be obtained

There is, perhaps, no gentleman in the United States whose opinion on this subject is entitled to so much weight as that of Mr. Gliddon, who was a resident in the Levant for twenty-three years, eight of them as United States Consul at Cairo, and who grew up with the camel and the Arab. His early days were connected with Oriental life, traversing at various times the deserts of Arabia and northern Africa. Mr. Gliddon, knowing the interest I felt in this subject, and that I had had some experience in my various journeys across the deserts and plains of the interior of our continent, has kindly placed in my hands the results of his inquiries into the history of the camel, and of its introduction into various parts of Asia and Africa, from which he has permitted me to make such extracts as I deemed suitable, for a brief paper like the present.

From my experience of nearly three years with horses, mules, asses, and oxen, and with wagons, carts, and packs, I do not hesitate to hazard the opinion, that the introduction of camels and dromedaries would prove an immense benefit to our present means of transportation, that they would be a great saving to animal life, and would present facilities for crossing our broad deserts and prairies not possessed by any other domestic animals now in use.

Many have imagined that the camel, being indigenous to certain parts of Africa and Asia, would not thrive in America; but from the climate, and the food upon which he would be compelled to live in the districts where he would be required to labor, I doubt not his habits will be found to be as well adapted to them, as to one half, or two thirds, of the region where he now thrives. Less than four centuries have passed since the introduction of the horse, ox, ass, mule, goat, sheep, pig, dog, etc., into America, and they now exist in myriads from the shores of the Arctic Sea to Cape Horn. Like man, they seem to adapt themselves to every clime; nature modifying them to the heat or cold, to the arid plains or the marshy lands, where they become domiciled. The camel is as strict-

ly a domestic animal as the horse, his existence in a wild state being now doubtful ;* and there is no reason why he may not as well adapt himself to our deserts and prairies as to the steppes of Tartary or the Sahara of Africa.

On the *forty* species of animals reduced at this day to a state of domestication, Geoffroy Saint Hilaire, a distinguished French naturalist, remarks that “ of these *thirty-five* are now cosmopolitan, as the horse, dog, ox, pig, sheep, and goat. The others have remained in the region of their origin, as the *lama* and the *alpaca* on the plateau of Bolivia and Peru, or have been transplanted only to those countries which most approximate to their birth-place in climatic conditions, as the *Tongusian* reindeer at St. Petersburg. Out of the *thirty-five* domestic species possessed by Europe, *thirty-one* originated in Central Asia, Europe, and Northern Africa. Only *four* species have been contributed by the two Americas, Central and Southern Africa, Australia, and Polynesia ; although these portions of our globe contain the greater number of zoölogical types. In consequence, the great majority of domestic animals in Europe are of exotic origin, and hardly any are derived from countries colder than France ; on the contrary almost all were primitively inhabitants of warmer climates.”†

Widely as the camel, or “*ship of the desert*,” as it is called in the poetic language of the East, is now dispersed over all parts of Asia and of Central and Northern Africa, there is historical evidence to show that there was a period when he was a

* Humboldt quotes Chinese and Turkish authors who affirm that the wild camel, as well as wild horses and asses, is still to be found in Eastern Turkistan and in the countries north of China. Cuvier believes that, if such is the case, they have merely become wild after their owners had given them their liberty. In the interior of Sonora are thousands of wild cattle which are fiercer than the buffalo. The wild horses, or *mustangs*, of Texas and Northern Mexico are also known. But all these are the offspring of domesticated animals.

† *La domestication du Llama, etc. Projet d'une Ménagerie Nationale d'Acclimation.*

stranger, even in Africa, and when his sphere in Asia was comparatively limited.* Now, his geographical diffusion is equal to

* "The camel," says Humboldt, "was entirely unknown to the cultivated people of Carthage, through all the centuries of their flourishing existence, until the destruction of the city. It was first brought into use for the armies by the Marusians, in Western Lybia, in the time of the Cæsars; perhaps in consequence of its employment in commercial undertakings by the Ptolemies, in the valley of the Nile. The Guanches inhabiting the Canary Islands, who were probably related to the Berber race, were not acquainted with the camel before the fifteenth century, when it was introduced by Norman conquerors and settlers. In the probably very limited communication of the Guanches with the coast of Africa, the smallness of their boats must necessarily have impeded the transport of large animals. The true Berber race, which was diffused throughout the interior of Northern Africa, is probably indebted to the use of the camel, throughout the Lybian desert and its oases, not only for the advantages of internal communication, but also for its escape from complete annihilation and for the maintenance of its national existence to this day. The use of the camel continued, on the other hand, to be unknown to the negro races; and it was only in company with the conquering expeditions and proselyting missions of the Bedouins through the whole of Northern Africa, that the useful animal of the Nedschd, of the Nabatheans, and of all the districts occupied by the Aramean races, spread here, as elsewhere, to the westward. The Goths brought the camels as early as the fourth century to the Lower Istros (the Danube), and the Ghaznevides transported them in much larger numbers to India as far as the banks of the Ganges.*

Other authorities agree as to the comparatively recent introduction of the camel and dromedary into Northern Africa. Baron Humboldt distinguishes two epochs in their distribution there, "the first under the Ptolemies, which operated, through Cyrene, on the whole of the north-west coast, and the second under the Mohammedan epoch of the conquering Arabs;" † while the dromedary, now so much in use, was only propagated in the region of Algiers as late as the middle of the sixteenth century.‡

A number of curious facts have been brought together by Mr. Gliddon, to show that the camel was not used in the earliest Egyptian times; the most satisfactory evidence of which is, that it does not appear on any of the Pharaonic monuments: a conclusion to which Champollion-Figeac had arrived. "But one thing worthy of remark," says that distinguished archæologist, "is that there is not found on any monument the figure or mention of the camel; a native of Arabia. This valuable animal appears to have been unknown to the ancient Egyptians for service." §

that of most other domesticated animals. "He has followed," says Mr. Gliddon, "the radiations of war, commerce, and emi-

In the journeys made by the patriarchs of the Scriptures into Egypt they were accompanied by camels; these animals were also employed in bearing the productions of Arabia to that country, but they were always the property of *aliens*, and their residence there was but temporary. So "during the stay of the Hebrews in the land of Goshen, no allusion is made to camels, save in Exodus, ix. 3, whether owned by themselves or by their Egyptian rulers. On the contrary, the especial mention of *asses* as the animals on which Jacob's sons carried their sacks of corn over the desert of the Isthmus of Suez*—of *wagons* furnished by the Egyptians to bring up Jacob from Canaan †—of *cattle, horses, flocks*, and *asses*, as the only zoölogical property the famishing Egyptians could give in exchange for bread, ‡—combined with the notable fact that, in the account of the Mosaic exodus, *horses* attached to chariots and *cattle* are the only quadrupeds enumerated;—all these accumulated evidences, I repeat, amply confirm hieroglyphical and historical negatives of the naturalization of camels in Egypt, at any time prior to the Persian invasion, B. C. 525." (*Gliddon's Memoir, MS.*)

One of the most elaborate treatises on the geographical distribution of the camel in the Old World, is that of the distinguished geographer and ethnologist Karl Ritter, who in his great work has devoted 150 pages to the history of this quadruped. I shall merely quote the results of his investigations to show the wide extent of the present diffusion of the camel. These natural limits are established as follows:—"Towards eastern and south-eastern Asia, by the tropical, sultry, maritime, Indian, and Farther Indian climate of the *Elephant-land* and fluvial zone of the *Cocoa-forests*;—towards the north on the Upper Jenesei, Baikal, and Irtysh, by the *Reindeer-zone* of the sub-polar climate of 58° to 56° North Latitude;—beyond the flat steppe-lands of the nomadic tribes, by *agriculture* upon the European *culture-ground*, with the fixed dwellings of its inhabitants. In the *Maghreb*, or northern half of the African continent, the Lybian camel-zone, towards the north (from the Erythræan East to the Atlantic West), is exhibited *without limit*, as far as the Berber races, as well as Moors and Bedouins, inhabit the Sahara and the Oases. But *south* of that it is limited by the zone of *tropical rains*, or the wet season, along the valleys of the *Senegal*, the *Niger system*, and the *Bahr el-Abiad*. Here the expanse of sand and gravel changes into a luxuriant, thickly-wooded, fruit-bearing soil, subject to inundation, before which the organization of this desert-animal shrinks back, and where begins the *belt of the central Negro States of Soudan*, or the *Land of the Blacks*, with whom asses and bullocks, as universal beasts of transport, thrive, being better suited to the climate, or where the negro has become his own bearer of burdens." §

* *Genesis*, xlii. 27; xliii. 18, 24.

† *Id.* xlv. 21, 27; and xlvi. 5.

‡ *Id.* xlvii. 17.

§ *Karl Ritter, Asien.*

gration over a stupendous segment of the earth's superficies," stretching across the whole of Asia, and extending as far north as the 56th parallel of latitude. Amid the defiles of the Caucasus, the Himalaya, and the Kuenleén ; over the black plateau of Upper Asia, and the scorching plains of Hindostan ; skirting the shores of the Indian Ocean, the Yellow, the Caspian, and the Black seas, "winter or summer, he resignedly plods his weary way," burdened with whatever load his master places on his back. He is much used in eastern Europe ; and in Africa, across its entire breadth, from the shores of the Mediterranean to the region of the tropical rains.

Taking a portion of the North American Continent corresponding with the camel zone of the old world, the most extreme northern limits of the United States would be congenial to him. But we should not require his services north of Missouri, or about the 40th parallel. From thence, southward to the Gulf of Mexico, but particularly in Texas, the climate would be most congenial to him. The high table-lands of Texas, New Mexico, Utah, Sonora, Chihuahua, Durango, and portions of Central Mexico, are equally adapted to him. The entire route from the Mississippi to California, particularly that south of Santa Fe by the Gila, where there are no mountains to cross ; and also, the great highway over the table-lands of Mexico, are well adapted to his habits. But he would be most useful on those long jornadas and deserts where there is either no water, or where it is so brackish that mules and horses will not drink it.

There are peculiarities in the arid plains and deserts of North America which seem to fit them for the habits of the camel. His favorite food in Africa is beans and chopped straw. Now, it is a well known fact, that however barren our deserts, they abound in mezquit bushes or chapporal, which shrub bears a most nutritious bean. Whether this plant attains a height of three feet on the desert or twenty in the bottom-lands, it is equally prolific. Mules and cattle feed on

them when they cannot get grass or corn ; yet they never thrive on them, but, on the contrary, lose flesh. Other peculiarities are the salines and salt lakes, which abound on the arid plains throughout the table-lands, as well as on the slopes towards both oceans. When driven to great extremities, mules will sometimes drink this salt or brackish water ; but I have driven them fifty or sixty miles without water, yet on reaching a saline not one in ten would touch it. To camels brackish water is as acceptable as if from the purest fountains.

“Frugal in appetite,” says Mr. Gliddon, “the camel’s epicurism never rises above a sufficiency of split beans and chopped straw ; but while in the vernal season he relishes clover and grasses, his massive grinders, cutting like cold chisels, masticate alike the dryest stalks or the toughest thorns ; and his ‘cast-iron’ stomach digests and converts into nutriment stems otherwise so devoid of succulence, that the camel subsists where every other grammivore must starve. When necessary, he can go five days without water.”

With us, the food we shall have to give them will be various kinds of grasses, in particular those popularly known as mezquit, the grama, and the buffalo grass, which grow on the prairies, the elevated table-lands, and the mountains. For more solid food we have the Mexican frijoles and maize, with other cereals. On the deserts there are plants which mules will not touch, which the camel would doubtless feed upon.

With regard to the capacities of camels for carrying burdens all depends upon the breed. “Six hundred pounds,” says Mr. Gliddon, “is a fair estimate for the best Arabian well fed animal, with which he will travel twenty miles a day. The Bactrian camel, which is less capable of enduring heat, will carry ordinarily eight hundred pounds. Dromedaries, which are not employed for carrying burdens, but for riding, can travel freely fifty or sixty miles every twenty-four hours (including eight to twelve hours for rest and stoppage), and

this too with a rider estimated to weigh one hundred and seventy-five pounds and one hundred pounds weight of saddle, baggage, etc. His average gait is five miles an hour, at which he will continue for weeks. On an emergency he may be pushed, with this same weight, double the distance ; but then the jolting is increased with the speed of the animal, and could only be borne by experienced riders." Colonel Shiel, an experienced British officer, long versed in military service in Hindostan, says, the dromedary "is able to travel in all situations : mountains and plains, blazing sun, frost and snow, seem alike to him."*

It is proper to state that in *hot* countries the camel's hair is clipped close, while in the *cold* it is permitted to grow, according to the temperature he is exposed to, when it attains a length of six inches. Hence he can live in the region of the reindeer as well as in that of the lion.

This animal is therefore used exclusively, from the Nile to the Ganges, for the purpose of war and expresses, or duties requiring expedition ; and instances are on record where war parties of Bedouin Arabs, lightly equipped, with a small supply of provisions, have been known to traverse a space of three hundred miles in four days.†

I have devoted more space to this subject than I intended ;

* Journey through Kurdistan.—*Jour. Royal Geog. Soc.*, vol. viii. p. 97.

† "The female camel yields an abundance of excellent milk, which, mixed with meal, is the standard dish of Bedouin economy ; when acidulated, it constitutes the favorite dish of the Turkoman ; when fermented, an intoxicating drink called 'kermis' by the Tartars.

"The hair is a well known article of commerce, out of which nomadic tribes manufacture clothing and tents, as well as all the halters, cords, saddle-bags, and ornamental trappings for the camel himself. The flesh of a young camel is esteemed a luxury, and at every age a wholesome diet. It is cut into strips and dried in the same manner as beef is preserved in Mexico. The dung is used for fuel, in the same manner as the buffalo dung by our prairie travellers. The entrails and minor sinews are adapted to thongs, bow-strings, fastenings, etc., while the hide is sold for the same purpose as we use the hide of beef-cattle and buffaloes, such as shoes, sandals, belts, harness, saddles, etc."—*Gliddon's Mem. MS.*

but as it is little known, and is now being brought before the country, I have felt justified in extending these remarks. In conclusion, to give an idea of the number of animals used by the government for transportation, I quote from the official report of the Quarter-master General made in 1851. By this it appears that more than ten thousand horses, mules, and oxen were constantly required for transportation, and for mounting guides, spies, escorts, and troops. At the same time, when the army was increased about fifty per cent., the cost of transportation reached two million dollars, an increase of one thousand five hundred per cent. If we go back to the year 1844, the cost of transportation was about one hundred and twenty thousand dollars, and in seven years had increased to two millions.

APPENDICES.

APPENDICES.

A.

Article V. of the Treaty of Guadalupe Hidalgo, relating to the Boundary between the United States and Mexico.

“The boundary line between the two Republics shall commence in the Gulf of Mexico, three leagues from land, opposite the mouth of the Rio Grande, otherwise called Rio Bravo del Norte, or opposite the mouth of its deepest branch, if it should have more than one branch emptying directly into the sea; from thence up the middle of that river, following the deepest channel, where it has more than one, to the point where it strikes the southern boundary of New Mexico; thence westwardly along the whole southern boundary of New Mexico (which runs north of the town called *Paso*) to its western termination; thence northward, along the western line of New Mexico, until it intersects the first branch of the river Gila (or if it should not intersect any branch of that river, then to the point on the said line nearest to such branch, and thence in a direct line to the same); thence down the middle of the said branch and of the said river, until it empties into the Rio Colorado, thence across the Rio Colorado, following the division line between Upper and Lower California, to the Pacific Ocean.

“The southern and western limits of New Mexico, mentioned in this article, are those laid down in the map entitled, ‘Map of the United Mexican States, as organized and defined by various Acts of the Congress of said Republic, and constructed according to the best Authorities. Revised edition. Published in New York, in 1847, by J. Disturnell.’—Of which map a copy is added to this treaty, bearing the signatures and seals of the undersigned plenipotentiaries. And in order to preclude all difficulty in tracing upon the ground the limit separating Upper from Lower California, it is agreed that the said limit shall consist of a

straight line drawn from the middle of the Rio Gila, where it unites with the Colorado, to a point on the coast of the Pacific Ocean, distant one marine league due south of the southernmost point of the port of San Diego, according to the plan of said port made in the year 1782 by Don Juan Pantoja, second sailing-master of the Spanish fleet, and published at Madrid in the year 1802, in the Atlas to the Voyage of the schooners *Sutil* and *Mexicana*, of which plan a copy is hereunto added, signed and sealed by the respective plenipotentiaries.

“In order to designate the boundary line with due precision, upon authoritative maps, and to establish upon the ground land-marks which shall show the limits of both Republics, as described in the present article, the two governments shall each appoint a commissioner and a surveyor, who, before the expiration of one year from the date of the exchange of ratifications of this treaty, shall meet at the port of San Diego, and proceed to run and mark the said boundary in its whole course to the mouth of the Rio Bravo del Norte. They shall keep journals, and make out plans of their operations; and the result agreed upon by them shall be deemed a part of this treaty, and shall have the same force as if it were inserted therein. The governments will amicably agree regarding what may be necessary to these persons, and also as to their respective escorts, should such be necessary.

“The boundary line established by this article shall be religiously respected by each of the two Republics; and no change shall ever be made therein, except by the express and free consent of both nations, lawfully given by the general government of each, in conformity with its own constitution.

B.

Official Instructions from the Department of the Interior to JOHN R. BARTLETT, Commissioner on the part of the United States, for running and marking the Boundary line between the United States and the Republic of Mexico.

DEPARTMENT OF THE INTERIOR,
August 1, 1850.

SIR: In a letter from the Department, bearing date of June 19, 1850, you were informed that you had been appointed Commissioner

on the part of the United States for running and marking the boundary line between the United States and the Republic of Mexico, under the fifth article of the treaty of Guadalupe Hidalgo.

By the documents in this department, copies of which have been placed in your possession, or to which you have had access, you will perceive that that portion of the boundary between the junction of the Gila with the Colorado and the Pacific Ocean has already been run by your predecessor. By the same documents it also appears that the Joint Commission in February last mutually agreed to suspend their operations, and meet on the first day of November next, at El Paso, on the Rio Grande, and resume their operations westward from that point.

You will, therefore, in conformity with that agreement, proceed, with the Commission appointed to perform the duties of running the boundary mentioned, to El Paso, by the nearest and most convenient route, so as to reach there by the first of November.

As the organization of the Commission on the part of the United States has been made with a view to other objects beyond that of running the boundary, it becomes necessary to call your attention to the duties required.

By the sixth article of the Treaty of Guadalupe Hidalgo, provision is made for the collection of information relative to the construction of a "road, canal, or railway, which shall, in whole or in part, run upon the river Gila, or upon its right or left bank, within the space of a marine league from either margin of that river." And that "should it be found practicable and advantageous to construct such a road, the governments of both Republics will form an agreement regarding its construction, in order that it may serve equally for the use and advantage of both countries."

As the examinations to be made, and the information to be collected, agreeably to this article, are of very great importance, you will make such an organization of parties, and assign to them such duties, as will be productive of the desired result.

The boundary line where you will commence your labors begins at the "point where the Rio Grande strikes the southern boundary of New Mexico; then westward, along the whole southern boundary of New Mexico (which runs north of the town called Paso) to its western termination; thence northward, along the western line of New Mexico, until it intersects the first branch of the river Gila (or if it should not intersect

any branch of that river, then to the point on the said line nearest to such branch, and then in a direct line to the same").

This portion of the line can only be ascertained by examinations and surveys upon the ground. You will, however, receive important aid in the determination of this line, as the treaty expressly declares that "the southern and western limits of New Mexico, mentioned in this article, are those laid down on the maps of the United Mexican States, published at New York in 1847, by J. Disturnell," a certified copy of which was appended to the treaty, bearing the signatures and seals of the plenipotentiaries. You are furnished with a certified copy of this map.

The remainder of the boundary runs along the middle of the River Gila and the Rio Grande; of the former, from the point where the western line of New Mexico intersects it to its junction with the Colorado; and the latter, from the point intersected by the southern line of New Mexico near El Paso, to its mouth.

As the organization of the Commission under your charge has been made for the purpose of collecting information relative to the country contiguous to the boundary line, in addition to the running of that line, it is desirable that you should avail yourself of every opportunity afforded by your passage through the unexplored regions of Texas, New Mexico, and California, to acquire information as to its geography, national history, &c., when it can be obtained without retarding the progress of the boundary survey. You are, therefore, at liberty to send out exploring parties, when not otherwise employed on the survey of the line, to examine the country north of the Gila, as well as on either side of the Rio Grande, for the above and kindred purposes.

It is stated, on the authority of persons who have traversed the country near the river Gila, that during a considerable portion of the summer there is neither grass nor water to be obtained. Should the Commission be in this region at this season, it may be compelled to suspend its operations. In such an event, your party may be usefully employed in geographical and scientific explorations in the regions before alluded to.

The collection of information relative to the precious metals, quicksilver, and the various minerals, ores, and other substances, useful in the arts, is very desirable. In reference to the existence and localities of these, as well as the locations of mines formerly worked by the early settlers in California and New Mexico, and since abandoned, owing to the incursions of the Indians, or other causes, you will do all in your power

to acquire information as far as you may be able, without impeding the main objects of the Commission.

After you have traced the boundary to the junction of the Gila with the Colorado, you will be compelled to retrace your steps to El Paso. Before doing this, as you will possess many facilities for the purpose, you are at liberty to proceed up the Colorado River, and make such explorations as your time and facilities will permit, provided the boundary survey is not arrested in so doing.

The discovery of more practicable routes through California for emigrants, is desirable. The present routes, by way of the Great Salt Lake and the River Gila, are attended with many difficulties. If a portion of the Commission can be spared, with an adequate escort, to seek such routes, while it is in their vicinity, you are at liberty to employ them.

As it is indispensable that each government should be furnished with a full and circumstantial record of the proceedings of the Commissioners, they will doubtless order such to be kept in duplicate. This duty will devolve upon the clerks or secretaries appointed on both sides, who will be responsible for the accuracy of such records, and for their safe delivery, properly certified, to the respective governments, at the expiration of the Commission.

As soon as the boundary shall have been ascertained and marked, you will cause a true and accurate map to be made of the country through which it passes, in its entire extent. A duplicate copy of said map, certified by the commissioners and surveyors on both sides, should accompany the records of the proceedings of the Commission.

The joint report of declaration by the commissioners "of the final result agreed upon by them," under the fifth article of the treaty, will also be transmitted to the department, to be filed with the journal or record of their proceedings and the maps.

Your salary as commissioner, which has been fixed by Congress, at three thousand dollars, will commence on the fourteenth day of June 1850, the day of your appointment by the President, when you were ordered to report yourself for duty to this department. Under the head of contingent expenses of the Commission, will be embraced your reasonable personal and travelling expenses while in service, and those of the principal surveyor, chief astronomer, and other officers of the topographical engineers and navy who may be detailed to assist you in the field, or otherwise; the pay and subsistence of assistant surveyors and

draughtsmen, chain-carriers, mechanics, laborers, cooks, servants, and guides, and the incidental and necessary expenses of exploring parties ; the pay and subsistence of secretaries, surgeon, quarter-master, commissary, assistants, and clerks ; the purchase of an outfit, including horses, mules, tents, and camp-equipage, arms and ammunition, books and stationery, instruments, medical stores, boats, mechanics' tools, wagons, and vehicles for the transportation of the Commission, and its stores by sea or otherwise ; the purchase of articles for presents to, or traffic with, the Indians, clothing for the men (to be repaid by them) ; and the purchase and fixing of monuments to mark the boundary line. Of all these expenses you will keep a regular account, which, together with the necessary vouchers, you will render and transmit quarterly to the Fifth Auditor of the Treasury, for settlement. And to meet the same, as likewise the payment of the salaries, you will from time to time, as occasion may require, draw upon the Department, taking care not to exceed in the amount drawn at any one time the sum which will be required to meet the necessary and actual expenses of the Commission. You will be charged exclusively with the disbursement of the money appropriated to pay the expense of the Commission.

As soon as the Commission is filled, you will transmit to this Department a list containing the names of the several persons composing it, the nature of the duties assigned to each individual, and the compensation allowed to them respectively ; and will also, from time to time, inform the Secretary of the Interior of any change which you may by circumstances be induced to make in its organization.

In organizing for duty, you are referred, for any information which you may deem necessary, to Andrew B. Gray, Esq. who has been appointed Surveyor under the treaty, and to Brevet Lieut. Colonel John McClellan, of the Topographical Engineers, whom the President has designated as "Chief Astronomer and Head of the Topographical Scientific Corps of the Commission."

Very respectfully, your obedient servant,

D. C. GODDARD,
Secretary ad Interim.

JOHN R. BARTLETT, Esq.,
*Commissioner on the part of the United States, to
run and mark the Boundary between the United
States and Mexico.*

*Additional Instructions from the Hon. Alex. H. H. Stuart,
Secretary of the Interior, explanatory of the foregoing.*

DEPARTMENT OF THE INTERIOR,

November 4, 1851.

SIR: As some misunderstanding has arisen with regard to the instructions communicated in my letter of the 23d of October, 1850, I deem it proper to add such explanations and modifications as the circumstances seem to demand; and as Brevet Major Wm. H. Emory, the Chief Astronomer, has been appointed by the President the Surveyor, under the treaty, to run and mark the boundary line between the United States and Mexico, in place of A. B. Gray, Esq., some further explanations respecting his position and duties are necessary. The officers and members of the scientific corps immediately connected with the survey of the boundary line shall be placed under the immediate orders of the surveyor. Any lines agreed upon by the Joint Commission as the lines of boundary, shall be run and astronomically determined by the surveyor. He will have charge and direction of all the surveys of the boundary line, and shall determine the Initial and intermediate points of the survey by astronomical means, acting under your direction. This corps shall consist of such number of assistants as you, upon advising with him, may deem absolutely necessary. He shall issue his instructions in writing, and shall preserve a copy of them in a book kept for that purpose. He shall require monthly reports from the heads of parties, and shall place them before you in a condensed form. He shall have charge of the surveying and astronomical instruments; and for their safe keeping, will be responsible to you. He shall be allowed a clerk, whose salary shall not exceed that of a sub-assistant. He shall be responsible to you, and through you to this department, for as rapid a prosecution of the surveys, and for all the astronomy connected with them, as may be consistent with their accuracy; and will be held accountable for all the quarter-master's stores, camp and garrison equipage, placed at his disposal.

Should any doubts arise between yourself and the Mexican Commission, the surveyor shall be required to make such surveys and maps as may tend to elucidate the point or line in dispute.

Should the surveyor at any time differ with your views on any

question connected with the survey, &c., he will defer to your opinion until the case is submitted to, and decided by the department.

After the work in the field shall have been completed, the maps shall be drawn, under the immediate supervision of the surveyor under your control, on the scale suggested in the instructions to you under the date of October 23, 1850. In the mean time, during an inclement season, when the field-work may necessarily be arrested, the first plotting (or rough sheets) should be prosecuted. On the completion of the maps, they shall be signed by the surveyor, previous to their being authenticated by the commissioners.

No officer but yourself is allowed to draw for any moneys appropriated for the Mexican Boundary service. The surveyor may draw his salary from this department or from you. ALL THE SCIENTIFIC DEPARTMENTS *not directly connected with the surveys of the boundary line, are placed under your immediate direction.* The means appropriated by Congress being very limited, it is incumbent upon this department to order such reductions in the number of persons devoted to the purposes of science as your discretion may deem least advantageous. You, as the first officer of the Commission, will be held responsible to this department for the proper administration of the great work confided to your charge.

* * * * *

I am, &c.

ALEX. H. H. STUART,
Secretary.

To JOHN R. BARTLETT, Esq.
Commissioner, etc. etc.

From the corps of Topographical Engineers :

BREV. LIEUT. COL. JOHN McCLELLAN,	<i>Chief Astronomer, and Head of the Topographical Scientific Corps.</i>	
CAPT. E. L. F. HARDCASTLE,	<i>Assistant</i>	<i>do.</i>
LIEUT. A. W. WHIPPLE,	<i>do.</i>	<i>do.</i>

Colonel McClellan was recalled in October following, and Brevet Lieutenant Colonel J. D. Graham appointed in his place. The latter was recalled in October, 1851, and Brevet Major W. H. Emory appointed to his place; and soon after Mr. A. B. Gray, Principal Surveyor, was recalled, when Major Emory was appointed Surveyor, and the office of Chief Astronomer abolished. The Commission was greatly reduced in the summer of 1851, at which time other changes were made.

The following gentlemen, who accompanied Colonel Graham, reported themselves at the head quarters of the Commission, at the Copper Mines, in July and August, 1851 :

CHARLES RADZIMINSKI,	<i>Principal Assistant Surveyor.</i>	
LIEUT. A. E. BURNSIDE,	<i>3d Artillery, Quarter-master and Commissary.</i>	
LIEUT. W. F. SMITH,	<i>Topographical Engineers, Assistant Astronomer.</i>	
HENRY C. PRATT,	<i>Draughtsman and Artist.</i>	
JOHN H. CLARK,	<i>Zoologist and Assistant Computer.</i>	
CHARLES WRIGHT,	<i>Botanist and</i>	<i>do.</i>
JOHN LAWSON,	<i>Clerk to Colonel Graham.</i>	
W. A. TAYLOR,	<i>Sub-Assistant in the Surveying Corps.</i>	
JOHN J. PRATT,	<i>do.</i>	<i>do.</i>

Major Emory, on joining the Surveying party on the Rio Grande to relieve Colonel Graham, was accompanied by the following officers, to be added to those already detailed for that party :

LIEUT. MICHLER,	<i>Topographical Engineers.</i>
ARTHUR SCHOTT,	<i>First Assistant Surveyor.</i>
EDWARD INGRAHAM,	<i>Sub-Assistant do.</i>
GEORGE C. GARDNER,	<i>Clerk.</i>

D.

Official Report of the Survey of the River Gila, by Lieutenant A. W. Whipple, of the Topographical Engineers, dated San Diego, California, January 10th, 1852.

SAN DIEGO, CALIFORNIA,
January 10th, 1852.

COL.: I have the honor to report my arrival at San Diego, with the party of the Boundary Commission under my command. Nearly the whole time since you left us upon the San Pedro, until our arrival here, we have been upon a short allowance of provisions.

With fourteen and a half days' rations of flour, and without an escort, we left St. Peter's Springs upon the Rio San Pedro, on the 3d of October, 1851. We arrived at the desired points on the Gila, north-east of Fort Graham, on the evening of the 9th. The transit instrument was mounted the same night, and both limbs of the moon were observed for longitude. The Topographical survey of the Gila, was commenced at this point. My excellent assistants in this portion of the work, Henry C. Force and Frank Wheaton, are worthy of great praise for their industry and skill in the performance of their duties. I should be pleased to have their names brought before the Department at Washington, and their merits appreciated.

The survey was carried on without difficulty below the junction of Rio San Francisco, as far as the entrance to the cañon of the Pinal Lleño mountains. Into this we forced our way, although Indians told us that neither man nor beast could pass through. In some places by wading, in others by climbing upon the sides of the cañon, which rose perpendicularly from five to fifteen hundred feet in height, the survey progressed for eight or ten miles. The want of men and of provisions prevented us from sending reconnoitering parties in advance. The train passed over mountains rough and steep upon the north side of the river. Having succeeded in reaching a gorge by which a mountain stream leaps into the river, we were here compelled to abandon our wagon and lead the pack-mules over steep mountains. The following extract from the Meteorological Notes, will give an idea of our route.

Bank River Gila,	October 26,	8	A. M.	Bar.	27,779
Cañon Springs,	" 27,	S. Rise,	"	"	27,470
Iron Hill,	" 28,	6	A. M.	"	26,517
Summit Pass,	" "	8½	A. M.	"	26,073
Cascade Grotto,	" "	9½	A. M.	"	27,194
" "	" 29,	7½	A. M.	"	27,229
Peñal Pass,	" "	1½	P. M.	"	25,790
Rio Gila,	November 1,	4¼	P. M.	"	27,903

The Cascade Grotto is too wildly beautiful to pass unnoticed. Descending over twelve hundred feet in an hour, we plunged into an Indian garden, where were melons, maize, and beans, and to our surprise a field of cotton. This fertile spot is an inclined plain, evidently formed by deposit from a mineral spring, which gushes from the mountain, irrigates the fields, and then follows a ravine, leaping from cliff to cliff, in beautiful cascades, until it joins the Gila, which appears in view a thousand feet below the garden. Passing beneath the first water-fall, one enters a charming stalactite cave, consisting of two apartments, richly decorated. At the foot of the precipice are flowering shrubs and matted vines, whose red flowers gaily contrast with the surrounding verdure.

This singular formation is filled with petrifications. In one place was seen the trunk of a large cotton-wood tree completely petrified, and cropping out from a bed of coarse lime-stone. A chip showed distinctly bark and fibre.

From this point the Gila was inaccessible; and having hired an Indian from the hills, we followed his guidance, and reluctantly turned our backs to the river. Surrounded by a great body of Pinal Lleños, we passed through their strongholds, and on the 1st of November again struck the Gila, probably not more than ten miles below the point at which we left it.

Having surveyed up as far as possible from this place, we then followed the course of the Gila to the mouth of the Rio San Pedro. Here, while observing moon culminations for longitude, we sent a party eighty miles to the Pimo village, where flour was purchased. December 9th, I met this party on its return. When we arrived at the Pimo village, Colonel Craig, with our escort of twenty-three men, and Captain Barry, with about twenty-five days' rations, were awaiting us. The banks of the

river from the Pimo settlement to the junction of the Rio Salinas, are fertile, producing crops of cotton of the first quality. The Maricopas have been driven by the Yumas from their settlement near the Salinas into closer proximity to the Pimos. Within the last year many have been killed, including Juan Antonio Llunas, a Maricopa by birth, but commander-in-chief of the confederate tribes. If protected from incursions of Apaches, Cuchans, and Yumas, the Maricopas would gladly return to their fertile fields upon the American bank of the Gila; and, in case of an Indian war, they would prove a valuable auxiliary to our troops. The Salinas, at its junction, is a beautiful stream, clear as crystal, large as the Gila, and, to our surprise, not salt. Having progressed with the topographical survey to within about eighty miles of the junction of the Gila with the Colorado, and our supplies of provisions failing, we were obliged on the 14th of December to postpone its conclusion until provisions could be procured at the army depot at "Camp Yuma." In four days we reached the junction. Here, meeting Captain Jimenes and party of the Mexican Commission, who had arrived the day previous, to our consternation we learned that the military post had been abandoned. There was no alternative but to follow the soldiers. Crossing the Colorado, we arrived on the 1st of January, 1852, at Santa Isabel, where Captain Davidson kindly saved us from suffering by hunger. On the 8th of January we encamped at San Diego. The agricultural resources of the Gila are of little value to the United States, more than nine tenths of the soil susceptible of cultivation being upon the Mexican bank. Settlements could, however, be supported at the mouth of the San Francisco, opposite the mouth of the Rio San Pedro, upon the Salinas, and at the junction of the Gila with the Colorado. From what precedes it may be inferred that it would hardly be practicable to construct "a road, canal, or railway" to run wholly upon the river Gila. The Cañon of the Pinal Lleño Mountains is a complete barrier. The Pass below the junction of the Rio San Pedro, is equally impracticable. Between the Pimo settlements and the junction of the Gila with the Colorado, nature interposes no serious obstacle to the construction of a way of communication, such as the travelling public may demand. But from the Pimo village to the Rio Del Norte, I know of no practicable route even for a wagon road, except by entering the State of Sonora to avoid the Pinal Lleño Mountains. Possibly a route may be found following the course of the Salinas towards Santa Fé. Otherwise, a jor-

nada must be traversed to Tucson in Mexico; thence crossing the Rio San Pedro, a road may pass from spring to spring—leaving the Guadalupe Pass to the south—and may proceed in the vicinity of the southern boundary of New Mexico to Doña Ana. Four permanent military posts should at the same time be established near this route; one at Col. Craig's "Cantonment Dawson" among the Copper Mines of New Mexico, where a well-watered and fertile valley, rich in precious metals, would soon support a flourishing settlement; one at the mouth of the Rio San Pedro, where the Pinal Lleño Indians would be intercepted in their marauding expeditions to Sonora; and the third upon the excellent cotton-lands at the mouth of the Salinas. The fourth, upon the Colorado, has already been established by order of the War Department. By treaty stipulations with Mexico, it is solemnly agreed, that all incursions into her territory of our savage tribes shall be forcibly restrained by the government of the United States. At present, Indian depredations in Sonora are notorious. Scores of our own citizens also have been slaughtered by these roving robbers, and we have seen their bones bleaching by the road-side. The government is, therefore, bound to station a strong military force upon the frontier. Protection to the settlers will enable the resources of the country to be developed; emigrants, assured of safety and supplies at these depots, will avoid the perils and expense of a sea voyage; and it will soon be seen whether the wants of the people require, so as to render advantageous, the construction of a canal or railway which may in part run upon the river Gila.

The construction of a wagon road by the route proposed through Sonora for the use of both countries, would be of no less advantage to Mexico than to the United States. An agreement to this effect is, in fact, necessary to the fulfilment of the treaty stipulations with reference to the protection of the frontier. This done, and some slight encouragement given to trade, and the now half-depopulated province of Sonora will soon become one of the most flourishing States of Mexico.

From the day of first striking the Gila to the time of reaching its mouth, seventy days, astronomical observations were made every night except two, which were cloudy. The whole number of astronomical and meteorological stations upon the Gila were forty-six. Nearly all of these were also magnetic stations. Between the mouth of the Gila and this place are three intermediate astronomical and magnetic stations, besides those made on my trip from San Diego to the Colorado in Sep-

tember, 1849. Thus is completed a consecutive chain of magnetic stations extending from the observatory at Cambridge, Massachusetts, by way of Galveston, San Antonio, and El Paso del Norte, to the Pacific Ocean. At most of the stations, the three elements, inclination, declination, and intensity have been observed. In the astronomical and magnetic department, John O'Donoghue and Hugh Campbell have been my invaluable assistants.

The magnetic instrument used was made by Mr. George, of Falmouth, under the direction of the celebrated Mr. Fox, the inventor. It is the same that was turned over for this service by yourself at the close of the North-eastern Boundary survey. With it I observed at Chagres, Gorgona, and Panama, in 1849.

It is believed that a map exhibiting the results obtained will prove of much interest, and when published will add credit to the department under which the operation has been conducted. I regret that we have not the power of embracing the present opportunity—by returning to the United States by way of China and the Mediterranean—to surround the globe with a series of magnetic observations. Not only would the value of the results upon the boundary be greatly enhanced by such direct comparison at European observatories, but passing through or near the maxima of horizontal intensity, the lines of no variation would be crossed, and an exceedingly interesting belt of observations might be completed around that part of the world, at present, with reference to magnetism, so little known.

Notwithstanding the recent hostility of the whole tribe of Apaches, Colloteros, Pinal Lleños, and Tontos, through which we passed without an escort, nothing but kindness was received from them. The Yumas and Cocopas, though glorying in the belief that they had driven away the small detachment of United States troops stationed among them, still treated us with respect and favor. The vigilance of Colonel Craig gave them no opportunity of showing hostility.

One sad accident I have to record: the death of Thomas Harper, an excellent young man from Kentucky, and a member of my party. While bathing in the Colorado, he was seized with cramp, sank, and, although a dozen leaped into the water to afford assistance, the rapid current bore him beyond reach, and search was fruitless.

Major Heintzelman is now preparing to establish the military post at the Colorado River. Soon as this is done, I hope to be able to ob-

tain supplies of provisions; and in ten days after the recommencement of the work, the survey of the Gila will be completed. In the mean time, until the arrival of Mr. Bartlett, who is supposed to be at Guaymas, or, while awaiting other means of procuring supplies for our return, myself and assistants are actively employed in completing our observations and plotting the notes of the survey.

I remain, Sir, very respectfully,

Your obedient servant,

A. W. WHIPPLE,

Lt. U. S. Topographical Engrs.

TO BREV. LT. COL. J. D. GRAHAM, U. S. T. E.

Principal Astronomer, etc.,

U. S. B. Commission

E.

Colonel J. D. Graham to the Hon. Alex. H. H. Stuart, Secretary of the Interior, in reference to the Survey of the Head Waters of the Gulf of California and the River Colorado, by Lieutenant I. G. Strain, U. S. Navy.

WASHINGTON, December 31, 1850.

The Honorable the Secretary of the Department of the Interior having referred to me (for my views of the measures therein suggested) the letter of Lieutenant I. G. Strain, of the navy, of the 31st of October last, and the papers accompanying it, I have the honor to state that I have perused them all with attention, and that I feel obliged to give it as my opinion (which I do with all deference), that the measures suggested by Lieutenant Strain have no relation whatever to the survey and demarkation of the boundary under the Treaty of Guadalupe Hidalgo; and that they ought not in any way to be connected therewith. I have made a careful calculation of the length of boundary line to be surveyed and marked by suitable monuments, and find it to be about one thousand six hundred miles, independent of the lateral surveys that will be requisite, in order to determine the true line of boundary, should

doubts on this point arise, on any portion of the line, in the minds of the Commissioners. The aggregate extent of survey necessary to fix the line, will scarcely fall short of two thousand or two thousand five hundred miles. Every one connected with this survey will then have as much as they can possibly attend to in performing the duties immediately connected with the boundary line, which should be completed at as early a period as possible.

Besides these considerations of expediency, I cannot perceive how the expenses which would attend the accomplishment of Lieutenant Strain's project, could be legitimately drawn from the appropriations granted by Congress for the boundary survey.

The Gulf of California lies far from the line of boundary, and in territory belonging exclusively to Mexico, and not within the jurisdiction, therefore, of the United States. To attempt a minute survey of this gulf, under the pretence of its being an adjunct operation to the boundary survey, would undoubtedly arouse the suspicions of Mexico, and give offence to that Republic.

It is true, that by the provisions of the late treaty our citizens have the right of ingress and egress through the Gulf of California; and it is not improbable, that if the proposition were made to the Mexican government through the proper channel, she might be disposed to enter into a joint arrangement with our government for an accurate hydrographic survey of the gulf; an undertaking that would be equally honorable to both governments, and highly advantageous to the commerce of both people. But in such an event, I should think it highly expedient that so important an operation should, on our side, be placed under the direction of one of the organized corps of the government, maintained for such purposes, and provided with all the necessary apparatus and scientific experience which are necessary to success.

I find by the latest maps we have of California, that the area of this gulf is not less than sixty-two thousand square miles. To accomplish a survey of it in a manner to satisfy the requirements of commerce would, to say the least, occupy several years; and it would probably cost very nearly as much as has been appropriated for the whole boundary survey, perhaps even more.

If a mere reconnoissance of the gulf is proposed, I will remark that Mr. Gray, the United States Surveyor, informed me, on his arrival here, that General Persifer Smith had already detailed an officer and supplied

a vessel for that object. I presume he had proper authority for so doing.

In regard to the "flotilla," which Lieut. Strain alluded to as being in command of, I must again most respectfully remark, that I consider this an injudicious arrangement, and that it ought to be dispensed with. I have been frequently engaged on surveys, for the last thirty years, of rivers, harbors, and portions of the sea coast, and always found the best persons to manage the boats employed on such service were the engineers and surveyors charged with, and responsible for, the execution of the duty. Landsmen born and reared near the sea coast, or near our great rivers, generally possess all the skill requisite for the management of such boats; and I would much prefer on this boundary service the system, in this respect, which I have always heretofore practised, and therefore I recommend it to your favorable consideration.

The letter of Lieut. Strain to the department, of October, 31, and the papers therein alluded to as accompanying the same, are herewith handed back to the department.

"All which is respectfully submitted.

J. D. GRAHAM,

*Lt. Col. and Head of Scientific Corps,
&c., &c., &c.*

HON. ALEX. H. H. STUART,

Sec. of the Department of the Interior.
